**SODA CREEK.**—Cor. Plumas National, Oct. 13: The quartz mines of Soda Creek continue to prospect richly. More prospecting is being done than for years, one consequence of the extremely low rate of wages. Some failures are reported, but most of them are believed to be due to management and judgment of lower country "experts" who have superintended them. Among such "bursting bubbles" is at refreshing to know that some legitimate enterprises have been started. Among these are the Plumas ditch and mining company, the East Branch mining company and the Maxwell hydraulic mining company. All these companies' ditches or channels were completed in the next 50 years. The last two named companies have a never-failing supply of water. In this, the driest season ever known, they have been able to run their ditches to almost their full capacity. The East Branch company is operating on Wing hill, the Maxwell company is operating on Hard-rock Point hill, with 60 feet of gravel, which prospects better than anything ever known in that vicinity. Both companies have been at work in the next 50 years. The last two named companies have a never-failing supply of water. In this, the driest season ever known, they have been able to run their ditches to almost their full capacity. The East Branch company is operating on Wing hill, the Maxwell company is operating on Hard-rock Point hill, with 60 feet of gravel, which prospects better than anything ever known in that vicinity. Both companies have been at work in the next 50 years.

**PLUMAS.**—Cor. Plumas National, Oct. 13: The quartz mines of Soda Creek continue to prospect richly. More prospecting is being done than for years, one consequence of the extremely low rate of wages. Both companies have been at work in the next 50 years.

Nevada.

WASHOE DISTRICT.

**CON. VIRGINIA.**—Gold Hill News, Oct. 17: Daily yield, 550 tons of ore, keeping the present milling capacity fully supplied. At the 1750-ft level, the main drift is being pushed steadily ahead toward the west wall of the lode. The face is in ledge matter, but it has evidently not yet reached the west ore vein developed in the levels above. The repairs and enlargement of this drift between the ore vein and the C. & C. shaft were for about 300 feet it passed through swelling ground, which crushed in the timbers badly, is going steadily ahead. Cross-cuts Nos. 2 and 3 on the 1050-ft level the main drift west from the C. & C. shaft is steadily advancing, with the face in poor quartz, porphyry and clay. The various ore breasts and stopes of the east vein, as well as that of the sill floor of the west vein, are showing considerable improvement. The south branch from the C. & C. drift ore stope at this level more ore is being developed in hard blasting rock, needing no timbering. On the 1550-ft level the drift south from the shaft toward the south ore body is making satisfactory headway, and the enlargement and retimbering of the main air gallery at this level will be completed this week. The diamond drill boring upward from this level to tap and draw off the main vein from the south ore stope of the 1400-ft level is expected to effect a raise of very shortly, as it is now running through a heavy calc sand which doubtless holds the water. On the 1500, 1400, 1300 and 1200-ft levels the usual amount of ore extraction and development work is going forward.

**CALIFORNIA.**—Daily yield, 675 tons. The ore stopes and breasts at the 1550 and 1600-ft levels are yielding richly and showing more and more ore as further development is made. Reserves are opening out at the 1650-ft level, showing very much more ore than is required for present use. On the lowest or 1340-ft level the drift south from the Ophir continues following the west wall in very dry, hot ground. On the 1750-ft level the main drift from the C. & C. shaft is still pushing toward the west wall of the lode, with its face in ledge matter, but it has evidently not yet reached the west ore vein developed in the levels above. The repairs and enlargement of this drift between the ore vein and the C. & C. shaft were for about 300 feet it passed through swelling ground, which crushed in the timbers badly, is going steadily ahead. Cross-cuts Nos. 2 and 3 on the 1050-ft level the main drift west from the C. & C. shaft is steadily advancing, with the face in poor quartz, porphyry and clay. The various ore breasts and stopes of the east vein, as well as that of the sill floor of the west vein, are showing considerable improvement. The south branch from the C. & C. drift ore stope at this level more ore is being developed in hard blasting rock, needing no timbering. On the 1550-ft level the drift south from the shaft toward the south ore body is making satisfactory headway, and the enlargement and retimbering of the main air gallery at this level will be completed this week. The diamond drill boring upward from this level to tap and draw off the main vein from the south ore stope of the 1400-ft level is expected to effect a raise of very shortly, as it is now running through a heavy calc sand which doubtless holds the water. On the 1500, 1400, 1300 and 1200-ft levels the usual amount of ore extraction and development work is going forward.

**CALIFORNIA.**—Daily yield, 675 tons. The ore stopes and breasts at the 1550 and 1600-ft levels are yielding richly and showing more and more ore as further development is made. Reserves are opening out at the 1650-ft level, showing very much more ore than is required for present use. On the lowest or 1340-ft level the drift south from the Ophir continues following the west wall in very dry, hot ground. On the 1750-ft level the main drift from the C. & C. shaft is still pushing toward the west wall of the lode, with its face in ledge matter, but it has evidently not yet reached the west ore vein developed in the levels above. The repairs and enlargement of this drift between the ore vein and the C. & C. shaft were for about 300 feet it passed through swelling ground, which crushed in the timbers badly, is going steadily ahead. Cross-cuts Nos. 2 and 3 on the 1050-ft level the main drift west from the C. & C. shaft is steadily advancing, with the face in poor quartz, porphyry and clay. The various ore breasts and stopes of the east vein, as well as that of the sill floor of the west vein, are showing considerable improvement. The south branch from the C. & C. drift ore stope at this level more ore is being developed in hard blasting rock, needing no timbering. On the 1550-ft level the drift south from the shaft toward the south ore body is making satisfactory headway, and the enlargement and retimbering of the main air gallery at this level will be completed this week. The diamond drill boring upward from this level to tap and draw off the main vein from the south ore stope of the 1400-ft level is expected to effect a raise of very shortly, as it is now running through a heavy calc sand which doubtless holds the water. On the 1500, 1400, 1300 and 1200-ft levels the usual amount of ore extraction and development work is going forward.

level, gives good air circulation and increased working facilities. On the 1000-ft level splendid showing of fine ore is developed in the stopes south, east and west, and a large amount of work is being done at this level. On the 1550-ft level good work is being done, with plenty of rich ore in sight. On the 1500-ft level the various ore breasts and stopes are looking finely.

**BALTIMORE CO.**—The pumps and machinery are working finely and the water in the shaft is being steadily reduced. The best prospects exist at the two lowest levels, where the formation is most favorable, and small spots of good ore are encountered.

**YELLOW JACKET.**—On the 2200-ft level the main drift east toward the new shaft is in 420 feet; face in porphyry with seams of quartz. The main drift south at this same level is in 391 feet, the face showing quartz, with small irregular clay seams. At the new shaft everything is working well, the new machinery operating finely in every respect. Sinking the shaft is making fair progress.

**CROWN POINT.**—The principal operations are confined to the old workings near the surface, which are assuming quite a degree of interest, a considerable amount of good milling ore being found, which is being extracted for milling. The ore assays from \$25 to \$40 and the yield is about 100 tons per day. It comes principally from the 1600-ft level, and at the 230-ft level a cross-cut is now being made, to determine whether the ore extends to that depth or not. The water from the 2000-ft level is expected to be turned into the Belcher and Crown Point combination shaft to-day. This water, which has formerly been lifted by the Crown Point pump, will hereafter be taken out by the Consolidated pump.

**JULIA CO.**—Considerable improvement is met with in the prospects at the 1900-ft level, the drift east from the winze having run into good ore. The extent of the ore is not ascertained as yet, but it is an important development. It lies some 425 feet east from the winze.

**BEST & BELCHER.**—Drifting north from the Oould & Curry drift, at the 1900-ft level into this mine, is steadily progressing, and the water in the shaft is being steadily reduced. The best & Belcher is sinking in hard porphyry.

The cross-cut west, near the Consolidated line, on this level, has made excellent advancement through streaks of soft vein material of no value and the face is now in hard porphyry.

**ALTA.**—Cross-cuts Nos. 2 and 3 at the 1050-ft level show improvement. The main drift is making good headway at a lively rate, and in a distance of 200 feet more, or at the 1250-ft level, is expected to cut the ledge again.

**SUTRO TUNNEL.**—The face of the header continues in soft ledge matter, consisting of vein porphyry, quartz and clay, requiring close and constant timbering and allowing of very slow advancement. The tunnel being now over 19,000 feet in length, it is evidently into the eastern outskirts of the Comstock, and can soon be made available for drainage.

**JUSTICE.**—Daily yield, 300 tons per day from the ore-producing sections of the 1000 and up to the 600 and 700-ft levels. Sinking the main incline below the 1150-ft station is progressing well in favorable ledge matter.

**LEVATHAN.**—The water has been lowered sufficiently to permit of work being resumed on the 800-ft level. Cutting out the west side of the purpose of setting an engine, with which to sink the winze deeper. As soon as these arrangements are completed, the water will be taken from the winze and the work of sinking resumed.

**CHOLLAR-POSS.**—Daily yield, 30 tons, the car samples of which assay \$23 to the ton on the average. The old ore sections hold out well and show no particular change worthy of note. On the 1755-ft level the main drift east connects with the Chollar-Norcross-Savage combination shaft is steadily advancing, with its face in hard blasting rock, having 600 feet yet to go.

**GOULD & CURRY.**—The drift connection with the Savage joint winze on the 1900-ft level being completed, the drift is being extended north to the Best & Belcher. A bob-bit, below the 1700-ft level of the main incline, is being cut out for the pump.

**BELCHER.**—Main south drift, on the 1000-ft level, pushing steadily ahead, in promising vein material, with occasional small streaks of ore, and the winze being sunk from 1600-ft level to connect with this drift is being sent downward as fast as is practicable, with a compressed air engine to do the hoisting.

**AMAZON.**—This well known mine at the south end is about to come again into its former degree of prominence. Work is to be resumed in it very soon, all the financial difficulties of the company having been satisfactorily arranged.

**SILVER HILL.**—Sinking the incline below the 800-ft level is being vigorously prosecuted. At this level the drift toward the ore vein is advancing in favorable working ground.

**JOE SCATES AND GEORGE DOUBLAIS.**—The main shaft is now down to the depth of 260 feet, with fine looking quartz formation at the bottom. Three shifts of men are employed.

**SUCCESS.**—The shaft has now attained a depth of 900 feet. The last 10 or 12 feet has been in soft ledge material of the regular Comstock style, with heavy streaks of quartz which give low assays.

**BULLOCK.**—Making excellent progress sinking the main incline, the ground working very favorably with no water to trouble. The east cross-cut on the 1700-ft level is advancing at a good rate in quartz of an encouraging character.

**SOUTH COMSTOCK.**—The drift south, on the 500-ft level, has been advanced 10 feet since last week's report, making a total distance from the shaft of 31 feet; material in face quite hard.

**CON. INFERRAL.**—The winze being sunk from the 2135-ft level to connect with the drift north from the Yellow Jacket 2000-ft level is making good progress downward. Good streaks of quartz are coming in at the bottom.

**SAVAGE.**—All the pump bolts being properly arranged, ballasted and adjusted, the pump started into full successful operation last night, and threw a good full stream, and with the assistance of the Hale & Norcross pump, the water so long flooding the mines is expected to be speedily reduced.

**TROIAN.**—Work is being actively resumed in this mine, the extraction and milling of ore being the first in order. A force of about 30 men are at work running a branch from the Virginia & Truckee railroad and building a dump for this purpose.

**UTAH.**—The drifts north and south on the 1150-ft level are steadily advancing, both in good working ground. The south drift is within 160-ft of the south line.

**WARD.**—Work was resumed at the shaft of this mine day before yesterday. The water is being pumped out and sinking will be resumed to-morrow.

**UNION CON.**—Slow progress is being made in the east cross-cut on the 1300-ft level, the ground being heavy and wet.

**MEXICAN.**—The Mexican and Union joint cross-cuts on the 1405-ft level are being pushed ahead without any change in the formation encountered.

**EXCHEQUER.**—The face of the main combination drift north, on the 2000-ft level, continues in good looking quartz and porphyry, and the east cross-cut gives good assays.

**HOMESTEAD.**—Everything about the mine looking well and progressing as usual. The water in the main shaft has increased somewhat.

**TWIN PEAKS.**—Preparations for further development of the mine are in active progress, the drifts being cleaned out and retimbered, and sinking the shaft deeper about to be commenced.

**HALE & NORCROSS.**—Pump running steadily as usual. It will have more marked success hereafter in assisting to reduce the water, as the Savage pump is completed and running in good shape.

**NEW YORK.**—The shaft has nearly reached the 900-ft level, and the bottom is in very encouraging vein formation.

**EAST ALPHA.**—Work is resumed on this claim, and sinking the shaft will be prosecuted hereafter as energetically as possible.

EUREKA DISTRICT.

**EUREKA CO.**—Eureka Sentinel, Oct. 13: The Eureka Con. keeps up its showing, and is at present engaged in developing one of the largest deposits of high-grade ore ever found off of the Comstock. Leaving out the resources

of the upper levels, which contain rock enough to keep the works running uninterruptedly for months to come, we find on the 10th level an ore body of vast and as yet undiscovered proportions. Since the straightening of the winze between the 9th and 10th, a drift has been run through ore over 200 feet, the face still continuing in high-grade rock. A crosscut north and south penitents 20 feet each way in ore, and a winze has been carried down 50 feet in ore. The connection with the 9th reveals the same state of facts, and proves beyond a doubt the existence of an immense bonanza, that will yield millions to the fortunate stockholders in the mine. The regular \$3 dividend will be declared next week, and as much as \$100,000 carried over to the next month.

**RICHMOND.**—The Richmond, since the termination of the lawsuit, has, as noted in former reviews, vigorously prosecuted work in other portions of the ground, not affected by the decision. At the time of the commencement of the suit, they had the underground workings in splendid order for the economical extraction of the ore that has since fallen into the hands of the Eureka company. Fortunately, without these magnificent reserves, the Richmond is proving itself to be a grand old mine. The development of the bonanza at the fifth level will still continue, and its proportionate value is yet unknown, although enough is in sight to insure a supply for the furnaces for a long time to come.

**K. K. CON.**—The K. K. Con. moves on very steadily, the usual amount of ore, some 90 tons, being extracted and sent to the furnace daily. Prospecting is being carried on in the lower levels. In the seventh level the drift is being carried forward as rapidly as circumstances will permit.

**JACKSON.**—The Jackson commenced extracting and reducing ore the present week, having started one of the Richmond furnaces last Monday. Sixty tons are shipped daily, and the output of bullion has been very satisfactory.

**DECLINED.**—A couple of experts from San Francisco have been exploring the depths of level and shafts of the mine during the week, having been sent here for that purpose. The mine was bonded 30 days ago for the sum of \$70,000, a very low price, considering the developments made in the property. The experts reported \$40,000 worth of ore in sight, and recommended the purchase of the mine at that price, an offer that was promptly declined by the owners, who could see no good reason why they should take that price for a mine that would pay for itself by silver and throwing the mine in. Another offer of \$120,000 has been made for the Bald Eagle, Black Eagle and Gray Eagle, all adjoining mines, and owned by the same parties.

**HAMBURG.**—The Hamburg mine is looking splendidly. The connections with the drift at the 450-ft level and the main shaft were made early in the week, and the thorough ventilation of the mine has been secured by the completion of the work and access afforded to the ore bodies from which the miners were driven by reason of foul air.

At the Hoosac the usual progress is being made, the efforts of the Superintendent being directed to opening up a new shaft and adit, which when finished will open out the mine in much better shape, and allow more economical operations than are possible in the old workings.

HUNTER DISTRICT.

**HUNTER FURNACE.**—White Pine News, Oct. 13: We have been shown a letter here from Hunter district which states that the new 40-ton furnace of the Hunter mine company is in full blast and is producing an entire success. The writer says: "It is turning out lots of bullion."

WHITE PINE DISTRICT.

**THE EBERHARDT MINE.**—White Pine News, Oct. 13: We are informed that a favorable showing for another large ore body in the Eberhardt mine on Treasure hill is being made. It is a continuation of the old chamber worked out last year. The vein that is being followed, and which may at any time open into another large chamber, is five feet wide and 40 feet high, and gives assays of \$50 per ton.

**EXONITS.**—Hamilton is just now undergoing a general clearing out—Eureka being the objective point of most of the work which are leaving. Every day some family take their departure, and at the present rate of migration a few weeks more will leave but few behind. We cannot exactly understand this general stampede, for there is more work being done and better prospects exhibited in the mines of this district to-day than at any time during the past two years.

Arizona.

**TIP TOP.**—Arizona Enterprise, Oct. 10: A. F. Pfister, the assayer, and James Finley, the forman of the Tip-Top company arrived on yesterday's stage, and will leave for the mine soon. This company has now about 70 men employed, and expects to have at least 500 engaged in and about the mine within the next month.

Is the Turkey Creek district some rich strikes have been made within the last few days, and as a consequence the lodes are fast being located, no less than eight claims having been recorded within the last week.

The Masterson mill has arrived, and the frame work is about done. It will be in running order in a short time. We understand that the mill will run on custom ore as well as from the Oodwin.

By last Tuesday's stage the Bank of Arizona shipped two bars of bullion—one 1400.00 oz., 967 fine, valued at \$1,333.69; one 1407.00 oz., 000 fine, valued at \$1,758.09. Total, 2874.20 oz., valued at \$3,591.78.

**SOLIN.**—Arizona Citizen, Oct. 6: Mr. Prontice Head informs us that C. O. Brown has made a sale of the Young America copper mine to San Francisco men for \$5,000 and that active work will be commenced right away. The Young America is situated some 50 miles about west of Tucson.

Mr. Flood, of Kirkpatrick & Co., of Oro Blanco district, was in town this week for some assayer's supplies. He says their mines are entirely satisfactory.

Mr. Davis, of Hays, is in town. He says the Alta. He says there are mine lodes better than ever, and the ore assays up into the hundreds. The company do not yet get satisfactory—although paying—results from the ore. The highest result yet obtained is \$83 to the ton, and double that amount should be saved.

**SAMUEL HUGHES** and others leave to-day for Montezuma district, about 35 miles to the southwest of town, where some extraordinary rich ore has lately been developed in a mine by Mr. Pacheco.

L. M. Jacobs & Co. this week received 32 pounds of silver bullion and \$300 in gold dust from the Santa Rita placers.

Colorado.

**WADES IN SAN JUAN.**—Cor. Salt Lake Tribune, Oct. 13: Having received several letters from the Wades inquiring about the wages paid here for laborers, will you give this space in your paper? It may benefit some who contemplate coming to this overrated mining camp. Carpenters get from \$2.50 to \$3 per day; brick-masons, \$2.50 to \$3 per day. Miners in some instances get \$3 and board, but it is next to impossible to get a situation in a mine. Crook & Co. are erecting a blast furnace, and proposing to get men from Utah to run their furnace at \$3.50 per day. Common laborers' wages are \$2.50 per day, and they have to pay \$7 per week for board. There are 10 men for every vacancy. My advice is stay with the Saints, until the country is better prospectively.

Montana.

**PONY DISTRICT.**—Cor. Helena Independent, Oct. 13: Mallory & Bros.' 10-stamp mill is working on Willow creek and Ned Ores; Oetcheff's 10-stamp is working on Boss Tweed and Keystone; Gormley's five-stamp is working on Last Chance ore; Heston & Bros.' six-stamp is working on ore from the Olden, Eagle, Custer and other claims, on custom work; L. S. Moreland's 15-stamp, steam power, is working on Strawberry and Keystone ores. Lehman's 10-stamp steam mill will be running in 20 days on ore from Metcalf & Co.'s Clipper lode, a 12-inch vein of rich ore, and D. J. Water's Eureka, a 30-inch vein

(Continued on page 252.)

### The Tea Fever.

Interest in the introduction of agricultural novelties is intermittent. Oftentimes the course of agricultural progress is in a circle, and its symbol might be a serpent with its tail in its mouth. New crops and new uses for old crops are continually being agitated, and the series repeats itself with almost the regularity of a repeating decimal. Hundreds of people, with commendable enterprise, embark in novelties which are proposed, and ninety-nine out of each hundred lay aside the venture because it seems at the time clearly impracticable, by reason of some existing difficulties. The last man or woman in each hundred clings to the novelty, carefully propagating it, and diligently caring for its products, in the hope and belief that the end will yet be in success. Something like this is the history of the tea plant in this country. Although 20 years ago the subject was agitated violently, and special experts were sent at Government expense to spy out this great industry of the Chinese, the growing of tea scarcely went further than the paper on which the accounts were written, so far as the actual outcome of the real drinkable material was concerned. Plants were grown successfully on this coast, and in some of the Southern States, and tea was made from the very expensive leaves by a very expensive method, because of the cost of labor. This has been done for the last 20 years, and is done to-day by those few, who, either from the interest in the culture, or some confidence that the industry would ultimately prevail, have cherished their plants.

It is now evident through notes which we see in the newspapers and from practical growers with whom we have come into contact that the tea fever is likely to break out anew. It is hardly likely to create such wide interest as it did a score of years ago, and all anticipations must be somewhat modified by the experience which has been gained. But there is a firm belief in some quarters that the problem has not yet been demonstrated adversely, although many experiments have failed for various reasons.

Those who are now advocating the re-opening of the case in favor of the convicted Bobea, propose to meet the labor difficulty by throwing aside the magnificent idea of extensive plantations and welcoming the tea plant to the gardens of the States where conditions are favorable for its growth. Let there be grown, say they, enough plants to supply the family demand for tea, and let the leaves be gathered and prepared by the housewife and her assistants just as the winter supply of sage or summer savory used to be cherished by our grandmothers, before the Quakers began the business of compressing a week's supply of catnip into a space as large as a yeast cake. Let the size of the tea plantation be according to the numbers of unemployed hands there may be in the farmhouse at the time for picking; in other words, let the farmer plant as many tea shrubs as he has unmarried daughters, or a certain number for each of these waiting beauties, and twice as many for each that has passed the age for matrimony—in short, allotting the plants according to the usual devotion of each for the plant and its products. Thus indeed would the labor difficulties be done away, and thus, by making each tea consumer answerable for his or her own supply, would the importation of tea be diminished by millions of pounds annually.

Inasmuch as tea is coming up anew, and we bear indirectly that the new Commissioner of Agriculture proposes to take up the subject for renewed investigation, we have reproduced the map which was drafted 20 years ago to serve as a basis for computing the probable tea area of this country. Readers will notice that it was drawn before some of our flourishing States were carved from the territorial expanse; but it will serve to give an idea of the regions which on theoretical grounds were denominated the tea regions of the United States. It may be well to hear this diagram in mind should the interest be reawakened, as now seems probable. It need only be said that in many of the parts indicated on the map the tea plant was found to grow well in practice when intelligently cared for, and in some there were failures. In Georgia, and perhaps in other Southern States, there may have been plants in growing ever since the early importation by the Government, and

tea is made for home use from boms-grown leaves. In our own State several parties have the trees in growing, and its adaptation for growth seems demonstrated. The matter is of interest certainly, and of how much practical value it can yet have made remains to be seen.

### The Gold Hill Mine, Idaho.

A correspondent of the Idaho *World* writes of this mine as follows: Being a searcher after information to lay before the readers of the *World*, concerning the resources of our county and Territory, I asked and readily obtained permission to enter this mine, and, accompanied by William Coughanour, one of the owners and Superintendent of the same, have been through its tunnels and stopes that are now being operated. As the mine has been worked continuously for a period of 14 years, there are some tunnels and drifts worked out near the surface that are of no interest to the reader, and will be passed over in silence. I will state in the beginning that there are but three owners in this mine, Thos. Mootry, and David and Wm. Coughanour; that a large sum of money has been expended in erecting the best class of machinery for hoisting and working the ore, the mill for the latter purpose being of good capacity, running 25 stamps and being provided with every facility and convenience for the successful working of gold rock,

work of sinking will commence, which will not interfere with the work of hoisting ore and reducing it. Although a considerable sum of money has been expended in preparing this mine for work, it is an important fact that no assessment has ever been levied since crushing commenced. This single mine has given life and vitality to the part of Boise county in which it is located, and appears now to be in better condition and more reliable as a permanent mine than ever before. They have had their drawbacks in the way of lawsuits and questions of title incident to all rich mines, but these difficulties are all of the past, and all is clear sailing now, with an established wealth and permanency beyond dispute. This is not the only rich mine in Boise county, but it is the best established and best proved mine in Idaho Territory, and the management is worthy of note.

### Humboldt County.

The resources of this county are as varied as they are extensive. The territory within her borders is sufficiently large to form an empire, being about five times as large as the State of Rhode Island, or two and one-half times as big as Delaware; possessing a sea-coast of about 125 miles, with several good harbors, among which may be mentioned Trinidad bay, which would be one of the best harbors of refuge for steamers and vessels to put into in case of distress if a breakwater or sea wall were con-

### Tuolumne County Mining Interests.

The following sensible article which will apply as well to other localities, is from the *Union Democrat*: Where so much mineral value exists as is found in Tuolumne county, there should be no end to persistent efforts to bring that value to the notice of the world, to make the vast treasure house yield its wealth and build up this section amid which it is situated. There are innumerable gold-bearing veins that are rich, and can be made to pay large and handsome profits if properly worked and handled. The great trouble is that few wish to work a mine unless a company is formed, some to work, some to pay assessments, and others to get a profit out of the cost of developing and improving. In nearly all instances where a few men have taken hold of a vein, and did with it as a farmer does with his farm, or as a legitimate tradesman or artisan does with his business, they have received a good return for the labor and money invested. Because a number of mines conducted on the "big augur" principle failed to put money in the stockholders' pockets, is no proof against the great value of the mines in this county. There is enough of them to employ several thousand men, if they will work prudently, with judgment and economy. Grand failures have not only tended, but have actually destroyed the reputation of Tuolumne for vein mining. This is all wrong, gold is not to be found here lying loose on the ground, neither is it to be picked out of the vein with the fingers, but it can be as easily obtained as in many other places that are held in high estimation.

### Now why is this?

Do our own people give proper encouragement? What amount of the huge sums taken out of our mines has remained here? Go ask the speculators and savings banks of San Francisco. Where is the army of men that realized fortunes out of the mines, mercantile business, and in other ways, from the natural resources of Tuolumne, where is their wealth? They and it have gone elsewhere to create property with the means drained from these hills. How many of you that are left with means are now crying "hard times" and giving no encouragement to our mines, but have locked your money up in savings banks, thus depriving the home you live in of powers of recuperation? How many of you close down the light of day on every dollar you obtain above expenses, drawing like a blood-sucker on the vitals of the county that gives a living easier than any in the world, and then depriving it of that nourishment which of right and duty you should bestow. This sponging must be stopped; you must change and give a hand to help along and encourage our mining interests, which you can in many ways. Help to redeem the unjust name that now attaches to your mines. You who put every dollar beyond your touch and then cry out loud and long for a railroad, with no intention of aiding or assisting the project only with your lungs and tongues are the worst enemies the interests of this county have. Draw your money from the savings bank, loan and invest it in your own county, then you will advance its prosperity, give her people an opportunity to make property, draw towards you a larger population, increase your own wealth and that of those around you. An empty bag will not stand alone. If every dollar made is immediately sent away, how in heaven's name can the county become any better? Quit making money bags of yourselves, and use your money in home investments. If this is done by all these depositors, they will realize a better rate of interest and in this way extend an aid that will insure a railroad; with a railroad the mines will be brought nearer capital and thus that interest will be advanced. Let the money that legitimately belongs to Tuolumne people be placed and used where it belongs, and all the advancement and improvements will come naturally; that too, without expense to those who will create this needed base to give this start to success.

**RECOVERY FOR PATENT INFRINGEMENT.**—In the United States Circuit Court, Judge Sawyer has given judgment against Joseph G. Eastland et al. (which is virtually against the city) for \$5,190, and in favor of the Pacific Submarine and Earthquake Proof Wall Company, for infringement of their patent. The infringement consists in using their system of horizontal and vertical rods in the walls of the new City Hall.

and that 50 tons per day is its capacity. The ore is hoisted through an incline of 45° 142 feet, the mine being now worked 100 feet below water level and to a depth of between 500 and 600 feet below the surface of the hills. After being lowered in a car to the foot of the incline, 60 feet took us to the point where the tunnel taps the lead running northeast and southwest. Here two tunnels diverge, one running west, or nearly so, on a small vein for a distance of about 150 feet, and the other bearing southwest about 350 feet along a main vein of good quartz, to where men were at work stopping. At the end of this tunnel the load of pay ore is about two and a half feet wide, from which we carried a handful to the surface, and after pounding it in a mortar obtained a handsome prospect of free gold. We crawled into the several stopes along the line of this tunnel, and everywhere found a good-sized vein of good ore. After examining this part of the mine for a distance of nearly 500 feet from the bottom of the incline west, we went through the old tunnel east a distance of 1,200 feet. This tunnel has been run along the ledge into the mountain until its depth beneath the surface has reached about 600 feet. A large portion of this has been stoped out, but still there is a large amount of ground to be stoped on this line, and in some of the works between the 100-foot level and the water level as rich ore is now being taken as ever came out before in quantities. Having explored a large subterranean area, we returned to the foot of the incline, placed ourselves in a car, rang the bell, and were hoisted to the surface in safety, having seen a vast amount of auriferous quartz. The company have worked the lead for a distance of 1,200 feet east of the hoisting works. As stated this mine has been tested to a depth of 100 feet below water level and found good. The prospects are better now than ever before in the history of the mine, for it is a settled fact that it is a true fissure vein, and is increasing in size. It is more regular in pay, while its continuity is settled beyond a peradventure. The company will sink a 150-foot level this fall, and for that purpose have ordered a new boiler to give increased power, and a Wilcox pump capable of hoisting water 250 feet, and as soon as they arrive the

structed from the light house point to what is known as Trinidad head—a large rock which stands out in the ocean about half a mile from the main land. This work will eventually be done by the National Government. The cost will not be great, and the benefit will be incalculable. The town of Trinidad has two saw mills, which employ, directly and indirectly, something over 100 men. Humboldt bay, situated about 25 miles south of Trinidad, is the best harbor in the State of California north of San Francisco. This beautiful bay is about 25 miles long by from three-fourths to six miles wide, and is one of the prettiest sheets of water in the State. At the head of this bay, or rather on the north side of it, is Arcata, beautifully situated, bounded, as it is, on three sides by a rich valley, called the Arcata bottom. This is one of the most fertile tracts of land on the coast, and produces immense crops. The landscape, as viewed from this town, is picturesque in the extreme. The immense flat, or bottom, as it is called, with its green and waving fields of ripening grain, its neat farm houses and dense redwood forests in the distance make it one of the most delightful landscapes. This charming little town has three saw mills, three churches, many stores, a telegraph office, good schools, and everything that could be desired to make it one of the most charming little towns in the State. Eureka, the county seat of Humboldt county, is situated on this bay, about six miles from the entrance, and about 12 miles south of Arcata. It has about six thousand inhabitants, is governed by a mayor and common council, has seven saw mills, churches for nearly all denominations, good public schools, two seminaries for young ladies, business places of every description, and is the most thriving town in the northern part of this State. It is surrounded by dense forests, and is in every way a prosperous place. Table Bluff, Springfield, Rohnerville, Hydenville and Ferndale are all prosperous places.—*Democratic Standard*.

A horse owned in Baltimore seizes the rats that come into his trough by the hack, and one grip with his teeth settles the case. He catches from three to six every night.

## Eureka District.

The month of October has opened very bright, and the presence of the pay-days, with the largely increased amount of coin put in circulation over that of former ones since the first of the year, is a very encouraging feature, and one calculated to infuse new life into all industrial and mercantile circles. The full benefit has not yet been felt, although the miners and laborers have distributed a large amount of money in paying off old scores and squaring up accounts. The money locked up in coal receipts—and there are very few business men in Eureka who do not hold some of these collaterals—will be loosened by the beginning of the week, and at least \$250,000 will be paid out in redeeming these evidences of indebtedness. Counting up the items of labor, coal, wood and other supplies, at least \$500,000 will be paid out by local companies between the 1st and 10th of the present month.

In glancing at the mining outlook, any one acquainted with the situation will pronounce it the brightest in the history of the district. Not only are the older mines being vigorously worked, but a large amount of prospecting is being carried on, those engaged in that work being encouraged by the fact that deep mining has proved to be the one thing necessary to develop the permanence of the vein, and that the lode shows as well at the lowest depth worked as at the croppings or near the surface.

The Richmond company have made some important developments, having, during the past week, uncovered a splendid deposit, and one that promises to be as rich and of as great extent as any ever found in the mine. The richest of this ore is being sorted in the mine, and is sent to the reduction works in sacks, so as to prevent waste in transportation, while that brought down in the ordinary way is far above the average in value. It is probable, as explorations are carried forward, that the ore body will be found to extend downward to, and below the sixth level. The section of the mine where these operations are being carried forward is ground never before touched, except in the running of air drifts, and the company, in consequence, have a right to look for the best of results.

At the Eureka Consolidated about 200 tons of ore are extracted daily, and the full reduction capacity of the company is employed in smelting the ore. This quantity makes no impression on the vast deposits in sight, and there is no apparent diminution in the reserves. The output does not come from one level by any means, but is broken down from the fifth to the tenth levels, and this great bonanza, developed by Superintendent Donnelly, is connected for a distance of 600 feet, and how much further it penetrates in depth can only be ascertained by future exploration. A number of the largest stockholders in the property have visited and examined it during the past two weeks, and all unite in pronouncing it a wonderfully rich mine, and the most valuable of any on the coast with the possible exception of two on the Comstock. The production for the month of September was something over \$300,000, and this return was necessarily limited to the smelting capacity.

At the K K the usual amount of work is being done with the same results. The output of the mine is very regular and of sufficient quantity to keep the furnace in constant operation. Superintendent Arrington is carrying on operations very systematically and with a view to the future. The output of ore comes from the fourth and fifth levels. On the seventh a drift is being run to the southeast, and there is every indication that the old ore body will be found making downward. Mr. Porter, an experienced smelter, has taken charge of the furnaces, and under his supervision everything is working very smoothly. The company average about four shipments of bullion per week.

At the Jackson the recent improvements—branch railroad, ore dumps, etc.—will aid very much in the economical working of the property and facilitate operations.

The Connolly mine is looking exceedingly well, and the same can be said of its neighbor, the Industry. Shipments of ore from the latter are being made to the Metamoras furnace. The connections between the main shaft at the 450-foot level, and the 600-foot east drift from the Friday shaft, was made at the Hamburg, and the ore body at that point uncovered. It is not probable that any ore will be reduced this season, but everything will be put in shape for vigorous work next spring.

A large amount of dead work is being done at the Hoosae, and the new shaft is going down steadily. Men are at work cleaning up and putting the old workings in order. There is considerable ore on the dump, and some good bodies in the mine.

The Metamoras furnace is well under way and will be completed by the 1st of November. A hoisting engine, rock breaker and sampling machinery has been shipped from Chicago, and will arrive next week. The new tramway will follow, and everything will be in position to commence operations by the above date.

The usual amount of work is being done on the outside mines, and large quantities of ore arrive at the furnaces from these sources. Summing up the situation, there is every promise that the winter season will be an unusually busy one, and Eureka district will be second, in life and activity, to none on the coast.—*Sentinel.*

## USEFUL INFORMATION.

## Color in House Furnishing.

From a recent lecture on "Industrial Art," by Charles L. Eastlake, we take the following paragraph: While on the subject of color, I cannot help saying that the more I study its effect and value, whether in pictorial or decorative art, the more convinced I am that its application will be found more harmonious in instances where one dominant hue is found to which all others are subordinate. You have all heard of that famous picture, "Gainsborough's Blue Boy," which is the delight of every painter and connoisseur. Now why has this portrait such extraordinary attraction? Chiefly, I venture to think, because it has this quality of chromatic unity. You recognize it at once as a blue picture, I don't mean that it is all indigo or cobalt, or French blue, or Prussian blue. It may pass from one to another of these shades, and include gray, white and green. You may get warmer hues of pink and brown in the flesh tints and background, by delicate contrast, but the prevailing tone is definitely blue.

Well I think that our rooms should be decorated on this principle, not in the upholsterer's sense of harmony by covering all his furniture with stuff cut from the same piece, and by hanging up curtains to match, but by making one color dominant and ringing in a variety of changes on it. In this way yellow might lead up to green, silver gray up to purple, and Venetian red up to brown, but the subordinate tints in each case should have a certain affinity to the dominant color, and when you have settled all this you will find that any little bit of contrast introduced provided it be unobtrusive, and does not interfere with your scheme, will have a cheerful rather than a discordant effect. And this principle concerning the decoration of a room may be safely applied, I think to all departments of design in which the element of color is a leading feature; as for instance, in textile fabrics, paper-hangings and the surface patterns of pottery and china. Wherever you find two or more colors introduced in such even proportions that you are puzzled to know which rules, so to speak, be sure the design is bad.

HOW FINE DARK CIGARS MAY BE MADE.—According to a little brochure, published lately by M. Haase, cigar manufacturer in Bremen, and reviewed by the *English Mechanic*, the artificial coloring of cigars is daily becoming more common. Most of the smoking public prefer strong and dark-colored cigars to the light and bright-colored. M. Haase reports that 76 per cent. of his purchasers order the former, and only 24 per cent. the latter. It is further known that most cigar-smokers prefer a cigar of a regular brownish color to an irregularly-colored, red, dun, or spotted cigar. On the other hand, the color of raw tobacco tends rather to bright than to dark, and the bad crops of the past year have furnished much bad-colored tobacco. Hence, with an increasing proportion of bright-colored and bad-colored tobacco, and the demand for the dark tobacco, the use of coloring sauces has increased. These sauces are all of pretty harmless ingredients, generally some dilute dye-wood extract in ammoniacal solution; but, indeed, these extracts contain no natural tobacco color. M. Haase condemns the practice; any artificial alteration of a natural product, like tobacco, in order to give it a better look, is in itself improper. Then the natural color of the covering leaf is of essential influence on the strength of the cigar, and most smokers lay great value on the color. But, with artificial coloration, the judgment is deceived, and a right inference from the external color to the quality of the cigar rendered impossible. Rubbishy cigars can, by coloring, be passed off for good. Hence all artificial coloring of cigars with such sauces must be regarded as a falsification of the goods for deception of the public.

FELT MATS.—The *Western Manufacturer* says that mats and rugs for carriage doors, etc., are now made of felt by the following process: A piece of felt of suitable thickness is cut into strips three to five-eighths of an inch in width, and as long as the mat is to be wide. These are laid side by side on edge, and holes are made through them, and through these holes cords of fine wire are passed, and the strips are then drawn tightly together and fastened in place at each end of the wires. This gives a fabric as thick as the strips are wide, and of a light, flexible and elastic character. The strips may be in various colors and may be disposed in any desirable pattern. These mats are reported to be strong and durable and able to resist heat, cold, dust and severe usage. The color keeps well because in dyeing the felt before the strips are cut a uniform color may be obtained, and when finished the mats have a good face on either side.

A NEW USE FOR OLD CORKS.—A patent recently issued in France gives the following process for manufacturing cork pasteboard: "Ground cork is thoroughly incorporated in paper pulp by means of mixing machines and very powerful presses. The board so formed has all the water pressed out and is dried like common paper. Old bottle corks, sole-shippings, and cork in other forms can thus be utilized. The pasteboard is springy, light, a poor conductor of heat and sound, as well as possessing other properties given it by the cork."

REFRIGERATOR CAR FOR EXPLOSIVES.—Mr. Mowbray, of North Adams, Mass., says the *Iron Age*, has just shipped in a refrigerator car 10 tons of mica powder to Fort Francis, 200 miles east of Winnipeg, a part to be used on the Francis canal and a portion on the Northern Pacific railroad of Canada, at Kewatin. The rock is so hard at both these points as to require an explosive of greater disruptive power than gunpowder, and this mica powder appears to answer the purpose exactly. The car used has been built for this particular purpose, it being necessary to maintain a temperature below 50° or 60°. The thermometer in this car has registered from 39° to 41° on the whole trip. This mica powder consists of tri-nitro glycerine and scales of mica, or Muscovy tale, in nearly equal proportions, and the object of a low temperature is to congeal the tri-nitro glycerine, which in this condition is absolutely non-explosive, and may be transported as safely as a box of soap. Two messengers, necessarily experienced in handling this powder, always accompany the car, in which a comfortable apartment has been provided for them. Their duty is simply to watch the temperature. In case of a smash-up, even, the cellular construction of the car renders explosion impossible, and if thrown on the fire of a locomotive there could be nothing more serious than a rapid burning of the powder.

THE PRESERVATION OF WINE WITH SALICYLIC ACID.—Prof. Nessler, of Carlsruhe, has discovered a means by which wine can be preserved by means of salicylic without necessitating a mixture with the same. He recommends the use of molten paraffin, containing two per cent. of salicylic acid for the saturation of small sticks of wood or cork, say of 15 m. m. length and two m. m. thickness, which are to be thrown on the surface of the wine, and thereby prevent the formation of mold. Experiments showed that wine, which would ordinarily spoil on an exposure of eight days to atmosphere, was with the addition of the wood particles so prepared, perfectly clear and sweet, even after an exposure of four weeks. If the mold has already been formed the addition of alcohol effectually kills the same, and causes it to fall to the bottom of the vessel. The addition of the salicylic acid in the way described prevents further formation. The cost of this preserving wine would not exceed 15 to 20 cents per barrel.

## GOOD HEALTH.

## How to Take Care of the Teeth.

Some time ago the Odontographic Society of Philadelphia offered a prize for the best essay on the care of the teeth, the same to be published for the benefit of the public.

The prize was awarded for the following rules for preserving the teeth:

1. Cleanse your teeth once, or oftener, every day. Always cleanse them before retiring at night. Always pick the teeth and rinse the mouth after eating.
2. Cleansing the teeth consists in thoroughly removing every particle of foreign substance from around the teeth and gums.
3. To cleanse, use well-made brushes, soft quill or wood toothpicks, an antacid styptic toothwash and precipitated chalk. If these fail apply to a reliable dentist.
4. Always roll the brush up and down lengthwise of the teeth, by which means you may avoid injuring the gums and necks of the teeth, and more thoroughly cleanse between them.
5. Never use a dentifrice containing acid, alkali, charcoal, soap, salt or any gritty or powerful detersive substance.
6. Powders and pastes generally are objectionable. They injure the gums and soft parts of the teeth, and greatly assist in forming tartar. A wash, properly medicated and carefully prepared, is pleasanter and more beneficial. It dissolves the injurious secretions and deposits, and the whole is readily removed with the brush and water.
7. Avoid eating hot food. Thoroughly masticate and insalivate the food before swallowing it. Frequent indulgence in sweetmeats, etc., between regular meals disturbs the process of digestion, and a viscid secretion is deposited in the mouth (from the stomach) which is very injurious to the teeth.
8. Parents, carefully attend to your children's second dentition. Gently prevail upon them, at an early age, to visit at frequent intervals a careful and skillful operator.
- Remember that four of the permanent double teeth come in at about the age of six years. They are very liable to decay early, are very large, and should never be allowed to require extracting.
- Children do not "shed" their teeth as they did in former ages. Instead of being trained to masticate nutritious food, they are tempted with and allowed to "gulp down" delicacies, hot cakes, hot beverages, etc.
- Thus, by depriving the teeth of their natural function and overtasking the stomach, a morbid condition of the general system is produced; the "first teeth" are prematurely decayed, and the permanent set are not matured at the proper period of dentition. The consequences are terrible.
9. Never allow any one to extract a tooth or to dissuade you from having them filled, unless absolutely necessary. Many so-called dentists, actuated by selfish motives, advise extracting, and sacrifice teeth which competent operators

can render serviceable for many years.

10. Carelessness and procrastination are responsible for a large majority of teeth that are lost.

## Marriage of Relatives.

There is a good deal of confusion in the minds of physiologists touching the effects of intermarriages between relatives. In the plant and animal creation it is noticed that interbreeding generally has good results, and it is very certain that in some cases the marriage of cousins results happily in the matter of offspring among the human species. It is, however, quite true that in the majority of cases the offspring of children of cousins are defective, and public opinion in consequence declares against such unions. This topic, says the *New York Graphic*, is again being discussed on account of the following statement which has been widely published, touching the celebrated naturalist, Darwin:

"Darwin married his cousin. His eldest son, William Darwin, is a banker at Southampton; the second, George, took high honors at Cambridge, and is now a fellow at Trinity; the third, Frank, who has inherited his father's ill health, acts as his secretary; the fourth, Leonard, is an officer in the artillery, and distinguished himself as one of the scientific corps sent to observe the transit of Venus; the fifth, Horace, is an excellent mathematician. One married and one unmarried daughter complete the family."

The rule with regard to the interbreeding of either men or animals seems to be this: Strong and robust parents, if of allied bloods, are likely to have children in every way superior to their progenitors, while weakly or diseased parents, if cousins, are almost certain to have defective offspring. In other words, nature, in the intermingling of allied bloods, intensifies the ruling peculiarity, whether it be strength or weakness. The bulk of mankind is imperfectly bred, and as a consequence, the children of people allied in blood are liable to be insane, blind, deaf, crippled, or in some way diseased. When, however, as seems to be the case with the Darwin family, parents are exceptionally healthy, or robust, the offspring is benefited by the union.

## Copperas as a Disinfectant.

Copperas (sulphate of iron) is largely used as a disinfectant for the miasmatic exhalations. According to some researches into its use by the *Polytechnic Review* it is of doubtful value for such purposes. It claims that the sulphate of iron, first of all, unlike the chloride of lime, is not a hygienic disinfectant. Although it is poisonous to higher forms of life, there appears to be no evidence that it acts destructively upon the lower forms of organisms, as does the chloride. One of the best illustrations that can be offered to prove conclusively that the sulphate is not a poison to the minute life forms, developed during putrefaction and decay, is afforded by the strong disposition of our common writing inks, most of which contain it in quantity, to become moldy, such mold being, as is doubtless well known, a fungus vegetation, which often appears on bodies in process of decay. We may designate the virtues of the sulphate of iron, for disinfecting purposes, as follows: It is not a hygienic disinfectant, since it does not destroy the lower forms of life. As a remedy, therefore, against the spread of epidemic diseases, which spread by the dissemination of the germs of such minute organisms, it is quite useless. As a chemical disinfectant, however, for the suppression of offensive odors, affecting the question of comfort rather than health, it is a most excellent agent. Wherever the ordinary system of a walled reservoir for holding excremental matters is in vogue, and where, as is generally the case, the reservoir is but seldom emptied, the air in the vicinity, especially during the period of low barometer, will be charged with pungent and offensive odors. These may be effectually checked by the periodical addition of the sulphate in solution in water.

EUCALYPTUS TEA.—Mrs. Fuller, of the Eisen farm, informs the *Fresno Republican* that she makes, daily, a pail full of tea from the leaves of the blue gum tree, and that all the men about the place drink some of this every day. There is not now, nor has there been any malarial sickness on this ranch during this season. We know of our own personal knowledge, says the *Republican*, that there were several cases of intermittent and bilious fevers on the same place last year. Irrigation is extensively practiced, and last year a large body of water passed through the ditch, which raised the water in the well, and also afforded a fine opportunity for frequent bathing. Some of the hands carelessly drank water from the ditch, and sickness followed in consequence. The absence of wind last season gave miasmatic poisons a better chance to generate than usual, but still we feel satisfied there need not have been more sickness than usual last year. The drinking water used this season is first boiled and then allowed to cool. The place is kept clean and in perfect order, and all hands take a little blue gum tea daily. The prophylactic and curative properties of the Australian *Eucalyptus Globulus* are well known to medical men, and different preparations of it are often prescribed. It grows thriftily in this climate, and no better preparation can be made than a tea made from the leaves, which, however, should steep, not boil, as boiling drives off the volatile oil which gives the plant its aroma and medicinal virtues.

## NEW ADVERTISEMENTS.

Machinery, Dunham, Carrigan & Co., S. F.; Pacific Business College, S. F.; Postponement—Mariposa Land and Mining Company.

## The Week.

The week has been devoid of interest as far as matters connected with mining are concerned. The meeting of mine Superintendents at Virginia to take into consideration the questions relative to the Suro tunnel, which is referred to elsewhere in this issue, will probably have the effect of definitely settling the matter. The principal topics of interest in the city of late have been the status of the savings banks, but now that the weak ones have been weeded out, the others can do business on even a firmer basis than before. Nothing does so much injury as lack of confidence in the savings banks.

The miners all over the State are busy preparing for the rapidly approaching winter and expect rain almost every day. The hydraulic claims are all in first-rate condition, the men having had time to get them in good order. The present year having been a very dry one, many quartz mills which run by water supply are now compelled to shut down until the rains come, the water power almost everywhere having given out. The mining communities are anxiously awaiting good, hard rains, so that they can set to work in earnest.

The lumbermen in the vicinity of Dutch Flat, Placer county, have resolved to discharge all their Chinese help from the saw mills as fast as white labor can be found, to take their places at \$35 per month and board.

## Amount of Ground Subject to Location.

## Quartz Mines.

The United States mining laws provide that after May 10th, 1872 (the date of the passage of this law), any person who is a citizen of the United States or who has declared his intention to become a citizen, may locate and hold a mining claim of 1,500 linear feet along the course of any mineral vein or lode subject to location; or any association of persons, severally qualified as above, may make joint location of such claim of 1,500 feet; but in no event can a location of a vein or lode, made subsequent to the date mentioned, exceed 1,500 feet along the course thereof, whatever may be the number of persons in the company.

With regard to the extent of surface ground adjoining a lode or vein, and claimed for the convenient working of the same, the Revised Statutes provide that the lateral extent of location, made after May 10th, 1872, shall, in no case, exceed 300 feet on each side of the middle of the vein at the surface, and that no such surface rights shall be limited by any mining regulations, to less than 25 feet on each side of the middle of the vein at the surface, except where adverse rights, existing on the 10th of May, 1872, may render such limitations necessary; the end lines of such claims to be in all cases parallel with each other.

By the foregoing it will be seen that no lode claim, located after May 10th, 1872, can exceed a parallelogram 1,500 feet in length by 600 in width, but whether surface ground of that width can be taken depends upon the local regulations, or State or Territorial laws in force in the mining districts; and that no such local regulations, or State or Territorial laws, shall limit a vein or lode claim to less than 1,500 feet along its course, nor can surface rights be limited to less than 50 feet in width, unless adverse claims, existing on May 10th, 1872, render such lateral limitations necessary. It is provided by the Revised Statutes that the miners of each district may make rules and regulations not in conflict with the laws of the United States, or of the State or Territory in which the districts are situated, governing the location, manner of recording, and amount of work necessary to hold possession of a claim.

In order to hold a possessory right to a location, made prior to May 10th, 1872, not less than \$100 worth of labor must be performed or improvements made thereon, within one year from the date of such location, and annually thereafter; in default of which the claim will be subject to relocation by any one else having the necessary qualifications, unless the original locator, his heirs, assigns, or legal representatives, have resumed work after such failure and before the relocation. The expenditures required upon mining claims may be made from the surface or in running a tunnel for the development of such claims. The act of February 11th, 1875, providing that where a person or company has run a tunnel for the purpose of developing a lode or lodes, the money so expended shall be considered as expended on the said lode, and the owner or owners shall not be required to perform work on the surface to hold the claim.

## Placer Claims.

The laws provide, also, that no location of a placer claim, made after July 9th, 1870, shall exceed 160 acres for any one person or association of persons, which location shall conform to the United States surveys. All placer claims, located after May 10th, 1872, shall conform as nearly as practicable with the United States system of public surveys, and no such location shall include more than 20 acres for each individual claimant.

These provisions of the law are construed by the Commissioner of the General Land Office, to mean that after the 9th of July, 1870, no location of placer claim can be made to exceed 160 acres, whatever may be the number of locators associated together, or whatever the local regulations of the district may allow; and that from and after May 10th, 1872, no location made by an individual can exceed 20 acres, and no location made by an association of individuals, can exceed 160 acres, which location cannot be made by a less number than eight bona fide locators; but whether as much as 20 acres can be located by an individual, or 160 acres by an association, depends entirely upon the mining regulations in force in the respective districts at the date of the location; it being held that such mining regulations are in no way enlarged by the statutes, but remain intact and in full force with regard to the size of locations, in so far as they do not permit locations in excess of the limits fixed by Congress, but that when such regulations permit locations in excess of the maximum fixed by Congress, they are restricted accordingly. A local regulation is valid, therefore, which provides that a placer claim, for instance, shall not exceed 100 feet square. Congress requires no annual expenditures on placer claims, leaving them subject to the local laws, rules, regulations and customs.

THAT once famous district, Meadow Lake, is coming into importance again. There are few miners thereabout who were the original locators, and their faith is still strong. The Pittsburgh and Excelsior mines are the only ones giving promise of pay at this time, and they are worked by 10 men.

## Working Dry Placers.

Some months ago we gave a description of a machine for working dry placer mines, invented by Geo. Ginn, at work at the Jicarilla placer mines in New Mexico. Later still we described the dry placer amalgamator of Duhem & Bennett, which was being worked at South Park, Colorado. We have had a great many inquiries from miners in California, Nevada and Arizona, about these machines, which shows that considerable interest is manifested in them. There are large tracts of land which would pay handsomely if either of the machines does as well as is claimed; and if the inventors would give us some definite statement about the cost of the machines and who the agents are, a number might be disposed of here.

The Ginn machine is about six feet long, six feet high and two feet wide, consisting of three screens and three tables, suspended from the beams which unite the four posts which form the corner braces. The screens, or sieves, whose meshes vary in degrees of fineness, are placed directly and obliquely above each other in the upper half of the machine, while immediately beneath are placed the rawhide tables, each of which has a series of riffles, on which the gold and iron-sand lodge. The sand, gravel and clay which carries the gold is fed on the upper and coarsest screen, and passes thence to the second and third screens in succession, and, while falling from the last mentioned, the auriferous earth encounters a blast of air from a No. 2 Sturtevant blower, run at a speed of 800 revolutions per minute. This blows out the sand and permits the iron-sand and gold to settle on the riffles, from whence it is taken out and washed. This machine, the result of numerous experiments, was founded upon the fact that a body is acted upon by air in proportion to the surface it presents, and the additional fact that gold—being from 8 to 20 times as heavy as the gangue in which it is found—will fall against the riffles, while the lighter material will be blown away. In fine, it is resolved into a question of specific gravity.

This appliance has been thoroughly tried at the Jicarilla placers, and we were informed some time since by a correspondent that he had seen \$8.50 in gold taken from it after a run of 16 minutes from dirt which washed 10 cents to the pan. It is stated that the machine will handle from 30 to 40 cubic feet of dirt in a day of 10 hours. It is claimed that the machine works satisfactorily in every respect. The inventor is George Ginn, now at the Jicarilla placers. Among those who have seen it work and who may be applied to concerning it, are Hon. H. M. Atkinson, Surveyor-General of New Mexico; Capt. Purington, 15th U. S. Infantry, Fort Stanton, and Mr. Markley, editor *Trinidad Chronicle and Enterprise*, Colorado.

The Duhem and Bennett machine is now at work on a mine in the South Park, about 10 miles from Hamilton, Colorado. In this mine are all kinds of dirt, from black bottom clay and mud to the ordinary gravel deposit. The gold is very fine. The machine, which is portable, being mounted on wheels, weighs about 4,000 pounds, exclusive of an eight-horse power engine and boiler required to run it. The necessary expense of running it is from \$8 to \$12 per day. The machine was run for six days on all kinds of dirt at the trial, and it was found capable of working from 1,000 to 1,400 pans of dirt per hour.

The following paragraph from the *Denver (Colorado) Times*, of last week, refers to the same machine:

"Duhem & Bennett's dry placer amalgamator is still proving its complete success in the South Park. Last week's hrick is stamped \$107. The mine upon which the machine is operating pays but 20 cents to the cubic yard. The machine works from 80 to 100 cubic yards per day, by measurement, at a necessary cost of \$8 per day. This is the first machine actually put in operation. Improvements have been developed which will be incorporated in future machines. When it is taken into consideration that the 40 inches of water required for a small sluice head, which will carry from 30 to 40 cubic yards of dirt per day, is, with economy, an ample supply for 20 of these machines, with an aggregate capacity of 2,000 cubic yards per day; that the sluice seldom saves more than two-thirds, and often not even one-third, of the gold, while it is admitted that at least practically the machine saves all the gold, and that it handles the dirt at less than half the cost of handling the same by sluice, it must be confessed that a great advance has been made in this class of mining. The machine has passed the experimental stage and become an admitted and fixed fact. This at once imparts a value to thousands of acres in Colorado of rich (dry) placer ground, hitherto considered worthless, which will now, besides yielding handsome revenues to their owners, furnish employment to thousands of otherwise idle men."

A NEW DISCOVERY.—A gold-bearing quartz ledge has been discovered near Dutch Hill mining camp, Plumas county. Lode runs nearly north and south on east slope of Grizzly hill, Ohio creek, not far above the old placer diggings, which prospects well in free gold. Ledge is traced for 6,000 feet; William Savercoole is the fortunate discoverer.

The Nanaimo river gold diggings have proved a failure.

## Foundry Notes.

## The Pacific Iron Works.

At the Pacific Iron Works they have just completed sugar mill machinery for two plants at Honolulu, consisting of engines and boilers, vacuum pans, sugar rolls, etc. They have also recently shipped a five-stamp mill to a mine near Hornitos, Mariposa county. Are now fitting out a new surface condenser with pumps, circulating pipes, etc., for the steam-tug *Pilot*. The works are now reconstructing the 20-stamp mill of the Star company, at Cherry creek, and adding two Howell furnaces; a set of power drills, with compressor, have also been sent to this company. Two of the Howell furnaces have lately been put on at the Grand Prize mine, and are said to be chloridizing up to 91 and 92 per cent. They have just shipped a copper smelting furnace for a mine belonging to Capt. W. H. Raymond, in eastern Nevada, and are making a new water jacket smelting furnace for the Modoc mining company, Inyo county. A saw mill has recently been sent down to the Peacock mountains, Mojave county, Arizona, to get out lumber for the Harkberry mill. This mill is now in rapid course of construction, and a Howell furnace is being built for use in connection with it. At these works they are also making the boilers and machinery for one of the Newton hydraulic dredging and mining machines. The hull is under contract, and work is being vigorously pushed on the rest of the dredge.

## The Fulton Foundry

Has just completed the new machinery for the Clay street hill railroad, which is now being put up. They have on hand now a 22 by 26 engine for the Navarro river mill of H. B. Tichenor. They are also building a five-stamp mill, with pans, settlers, shafting and fittings, which are for a mine in Mexico. Are making a seven-foot vacuum pan, condenser, vacuum pumps, etc., for a sugar plantation in the Sandwich islands. New hoisting works, of a heavy character, are also being fitted up for the Tybo Consolidated mine, in Nevada. This foundry has considerable small work on hand, and is employing now some 90 men. They have just added one of Ferris & Miles' new planers, with all the late improvements, and of a large size.

## The Wilcox Pump Works

Have a large number of orders on hand, and are very busy. The capacity of the works are being enlarged by the addition of new machinery, which is now being put in. They are, among other things, building three 15½-inch cylinder vacuum pumps, on original plans, for a Sandwich island sugar plant. Pumps are being made also for the Hinkle elevator in the Nevada block, and for a deep well in the same building. A large deep-well pump is also being made for Governor Stanford's place at Menlo Park; a deep mining pump for the San Andreas mine; a brass pump for Whittier, Fuller & Co's paint works, etc. The shop is running to its full capacity, as it has been for some time.

THE Hon. H. Hussey Vivian, M. P., of the well known mining firm of Vivian & Sons, Swansea, has been in San Francisco for the past two weeks. The large copper smelting works, nickel works, zinc works, alkali works and the very extensive gold and silver works, all of which are located in Swansea, together with many miles of coal veins, are under the management of this remarkably successful firm. During the 25 years which he has served Glamorganshire in Parliament, Mr. Vivian has placed his name among the most conspicuous statesmen of his country, while as a scientist he holds an honorable rank. Mr. Vivian was last week presented by the Welsh citizens of San Francisco with a cane characteristic of the State. The staff was made of California iron-wood, with California gold for the head, inlaid with beautiful pieces of quartz from our California canyons; while the crowning beauty of the gift is a cavity in the heaviest portion of the head, similar to a locket, in which are inserted small specimens of various California minerals—such as gold, silver, copper, cinnabar, iron ores, etc.

HYDRAULIC MINING.—The article on this subject from the pen of the well-known engineer, Aug. J. Bowie, Jr., which is now being published in the PRESS, is an especially valuable one, and our hydraulic mining friends will find it alone worth more than a year's subscription to the PRESS. The facts and figures given by Mr. Bowie are of great value as showing the results of practical work. A reliable article of this kind is more profitable for miners to read and study than any other class of literature. We advise those who do not usually file away the PRESS to commence keeping their numbers now and they will have this standard article as a whole. It has been carefully revised and corrected by Mr. Bowie and comprises the whole literature of hydraulic mining in California.

A VERY rich lead of ruby silver has been opened at Rock creek, 12 miles distant from Tuscarora, and will probably rise into prominence next spring.

At Mud springs, 40 miles from Battle Mountain, ledges have been found with brilliant indications.

## HYDRAULIC MINING IN CALIFORNIA.\*

No. 2.

(By ARD. J. BOWIE, JR., A. B., Mining Engineer.)

## Investigation of the Comparative Values of the Different Gravel Strata at North Bloomfield.

With their experience of the past and considering the contingencies of proposed explorations, and the attendant costs of an enterprise which had for its ultimate aim the working of the entire auriferous deposit, after mature deliberation it was (as a preliminary step) deemed of paramount necessity to ascertain, as far as practicable, the relative values of the different strata of the gold-bearing alluvia, so that they might judge to what extent the prospects would justify their expenditures. A series of explorations were subsequently carried out under the immediate supervision of their able engineer, Mr. Hamilton Smith, Jr., and the result of his investigation is best given in his own words: "To test the comparative values of ground developed by the shaft workings and top gravel, 240 samples, weighing in all two and one-half tons, were taken at even distances from the sides of the drifts, and the same quantity sampled from different layers of the upper bank. These samples were carefully panned out, and yielded, the blue \$1.10 per ton, the white a large number of colors, but an inconsiderable weight of gold. The gold from the blue dirt was from 50 to 100 times heavier than that from the white gravel."† Although the gross yield from this sampling of the upper gravel was slight, it is a noteworthy fact that in each of the 240 pans one or more colors of gold were found.

## Comparative Value of Gravel Strata in Stanislaus County.

At the Light claim, Patrickville, a comparative test of top and bottom gravel was made. 55,340 cubic yards top gravel yielded two cents per cubic yard. The bottom gravel (four feet deep) was then washed up, when it was discovered that this ground had been extensively drifted; but notwithstanding this fact, 4,966 cubic yards yielded 55 cents per cubic yard. A trial of top dirt was also made at the Light claim, La Grange; 41,038 cubic yards top dirt yielded three cents per cubic yard, and 7,242 cubic yards of bottom dirt\*\* yielded 94 cents per cubic yard.

## Sand Strata.

In the gold-bearing drift of the Sierra Nevada, layers consisting exclusively of wash sand are generally found to contain very little if any of the precious metal††. In gulch mining it sometimes happens that from the position of the bedrock the detrital accumulations assume the form of reclining cones, the apex reposing upon the top of the hill. Where such is the case, the bulk of the gold is concentrated in the lower end of the deposit. These gulches are frequently found to be exceedingly rich.

It is not within the scope of this paper to discuss the origin of auriferous detritus, or in any way to account for the mode of occurrence of gold, but these general facts are merely cited as an explanatory outline of the subject, and to show the reason why a system of sluicing is adopted which bottoms the entire deposit.

## The Records of Gold Washing.

The early record of gold washing extends to the days of the Greeks and Romans. History has familiarized us with the wonders of the Pactolus and Tagus, and it is a fact that the diggings north of Aquitania produced in two months such a large amount of gold that its price fell 33% throughout the whole of Italy.

Gradually, one after the other, the well-known deposits of the Old World have been exhausted. The alluvia in Siberia, however, kept alive the interest in gold washing, and the subsequent discoveries in California and Australia infused a new life into this kind of mining. Since that time gold washing has been carried on in different parts of the world on a most extensive scale, but the application of water under great pressure to "gold placer mining" is an outgrowth of the present century.

Its use is chiefly confined to the Pacific coast, and consequently the contributions to mining literature relative to its application have not been numerous.

## Hydraulic Mining.

It was left to the untiring ingenuity of the California miner in his battles for fortune to devise the economical methods of hydraulic mining, by which mountains of auriferous gravel are removed through the agency of a continuous stream of water, extracting the precious metals stored away by nature, and adding millions of hidden wealth to the treasures of the world.

Independent of the financial importance of this most modern method of mining, its effects, from the gigantic scale with which it is now carried on, upon the system of drainage of the

country as well as the navigation of rivers, will, sooner or later, bring it in direct conflict with agricultural and commercial interests.

Apart from the construction of ditches and tunnels necessary for the hydraulic washing of the gold-bearing drift, engineers, as a rule, have had but little to do with the subsequent working of this class of mines. The primitive placer mining of 1833 to 1865 has passed into history. Forty-inch wrought-iron pipes have been substituted for canvas hose and stove-pipes, and with the replacing of one-inch streams by nine-inch diameter nozzles, discharging under 400 feet pressure, the last remnant of the Argonauts' method disappeared, and hydraulic mining, with one gigantic stride, has become an operation of such magnitude as to require the aid of science.

## The Definition of Hydraulic Mining.

Hydraulic mining may be defined as the art of extracting gold from gold-bearing detritus, *i. e.*, surface deposits, placers or washings, by means of water under great pressure discharged through pipes against the auriferous material. In working these gold deposits by this method, it is essential to success that there should be: first, economical management; second, ample facilities for grade and dump; third, a sufficient head and an abundant supply of cheap water. As regards the "economical management," the same can be considered a *sine qua non* for success in all enterprises, but it is especially requisite here, as the value of this kind of mining is based on the great facility with

The Worcester Self-Feeding Drill.

which profitable results can be readily obtained, at trifling cost from washing vast areas of ground which contain relatively, per cubic yard, insignificant amounts of precious metal, but in the aggregate, when expeditiously and skillfully worked, give large remunerative returns.

## The Dump.

Without the dump, hydraulic mining is an impossibility. On this point too much stress cannot be placed. Where thousands of cubic yards of alluvium are being daily washed from their original positions into cauyons, valleys, streams, or rivers, it is not the accumulations of a few months which must be considered, but places must be provided at lower elevations, where the immense hills of gravel, when "hydraulicked,"†† can be re-deposited; and in general a very much larger superficial area for this is requisite than was originally occupied by the material removed.

It sometimes happens in claims near or adjoining one another, working with the same dump and on a light grade, that the bedrock in one is lower than that of the other. Where this occurs the claim with the highest bedrock should be the last run off, so as not to interfere with the dump of the lower claim. An illustration of this condition of affairs is afforded by the Patrickville hydraulic claims, in Stanislaus county, where three claims, one tailing over the other, are annually worked. During the last two years the lowest claim, called the Chesnau, has been closed in the fall, its dump giving out, whilst the upper ones continued work. With the return of spring freshets, the canyon has been cleared of the debris, and washing has been regularly resumed in the Chesnau, continuing as long as the dump lasted. The upper claim is closed whilst the Chesnau is working, to avoid the too rapid filling up of the creek. If the two higher claims were worked at the same time, the Chesnau would soon be closed for an indefinite period.

† The name is generally applied to those pioneers who arrived here in 1849-50.

†† The words "hydraulicked" and "hydraulicking" are the colloquial of the California placer miner, and custom has here sanctioned their use.

## Tailing into Streams.

It is supposed by many that the want of dump is remedied by discharging into a current or mountain rapid. This undoubtedly would be so, were the gold placers to border on large, rapid, and well confined streams; but in the mountains where the gold-bearing deposits are found, the rivers are narrow and shallow, only running water in quantity during the winter and early spring.

Some of the annoyances and difficulties arising from tailing into a stream can be seen on the Tuolumne river below La Grange. The river for 17 miles above the town has a fall approximating 15 feet to the mile. It is a large mountain stream (fed by the snows and rains of the Sierra Nevada), well confined by abrupt banks. At La Grange its width is 525 feet. Three hundred yards below the town, opposite the Light claim, it widens to 750 feet. Down the stream from this point the hills for the succeeding three or four miles recede, but subsequently form prominent banks of the river. During high water in the winter, opposite the Light claim at its greatest width, its average depth was ten feet, the center of the channel being 14 feet deep. When the La Grange hydraulic mining company commenced work, in 1872, the bottom of the channel was a few feet deeper.

The Light claim was worked in 1873, and by June 23d, 1874, 720,086 cubic yards of gravel had been discharged into the stream near the claim, and during the same period 975,064 cubic yards were dumped into the river from the Kelly and French hill properties. The results at the expiration of 21 months were that the channel opposite the Light claim was filled up, the sluices were run out of grade, the river bed was shoaled on all sides, the water of a former rapid stream straggled over the accumulated debris with a barely perceptible motion, and it is hardly necessary to add that the claim was closed.

The spring freshets of 1875-76 were unusually severe, clearing the river at the claim for its entire width, and leaving a dump of over 11 feet along its west bank. This spring (1876) work was resumed, and since then 48,280 cubic yards have been moved in the Light, and

Green's Improved Harrow.

212,346 cubic yards from French hill, which is a quarter of a mile up stream. At present\*\* the river is filled up nearly its entire width to the height of the sluices, and the water is confined to a strip 30 feet wide discharging one foot deep over a bar.

Where a small amount of tailings is discharged into narrow and steep canyons, winter rains and spring freshets suffice to clean them out, but where the quantity is large, in spite of the water the ravines gradually fill up, and hydraulic mining in those localities ultimately ceases. It occasionally happens that the want of dump room is obviated by a tunnel, and by means of it the tailings are conveyed into large and precipitous ravines, consigning them to the action of time and water for their further removal.

**Errata.**—Last issue, page 233, first column, second paragraph, fourth line, for "western boundary" read eastern boundary, also same page, fourth column, fourth paragraph, second line for "Mandango," read Mandanga.

\* The river opposite the old French Hill dump is 500 feet wide.

† At the ferry. The grade of the river from here to its mouth is only a few feet to the mile.

‡ Extreme width during high water. Width at lower stage 700 feet.

§ Deeper in narrow places.

|| April 10th work was resumed on top dirt.

\*\* Dry season—months of August, September and October.

**EUCALYPTUS FIRE-PROOF.**—At the last meeting of the Academy of Sciences Dr. Baer invited the attention of the Academy to a eucalyptus tree standing in the grounds of the old German hospital, on Brannan street. The tree had passed through the fire of August, 1876, and exhibited the peculiarity of resisting the action of fire—a property well understood in Australia. Dr. Kellogg stated that eucalyptus shingles were in common use in Australia, on account of their being fire-proof. It was impossible to fire a roof made of this material. There were some 132 species of eucalypti, but all seemed to possess this non-combustible property to some extent. Dr. Gibbon said that the planting of trees in the public streets would be an important means of checking a conflagration, and as the eucalyptus seemed to be peculiarly valuable for that purpose, and for building, the attention of the public should be called to it.

**THE CONTINENTAL ORE AND TRANSPORTATION COMPANY** have established depots at Ogden and other points of the Union Pacific and Central Pacific railroads, and they have selected Reno as the point of supply of Nevada with coal and turpentine.

## An Improved Harrow.

James B. Greene, of Elliott, San Joaquin county, has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an improved harrow, an engraving of which is shown on this page. The improvement consists in so constructing an A-shaped harrow that the bars or timbers to which the teeth are secured are hinged to a supplemental frame, and by means of connecting rods and levers, any one or more of these sets of teeth may be turned alternately so as to relieve themselves of the rubbish which may accumulate before them and thoroughly clean themselves. The number of sets of teeth may be multiplied or increased at will, and two or more sets may be united and operated by the same lever.

When working ordinarily the levers will be retained by a central catch in a curved rack, but when the harrow becomes clogged the lever controlling the front pair of harrows is released and turned to one side.

The movement causes the hinged timber upon the side to turn, so that the teeth point backward and this allows them to be wiped clean of the rubbish. Meantime, the movement of the lever around its fulcrum will point the opposite set of teeth a little forward, and they will continue to work until the lever is turned to the opposite side, when the relative positions of these two sets of teeth will be reversed and the opposite set will be cleaned. While this is being done the rear pair of harrows are still at work, so that there will be no portion of the ground not harrowed, and they will also serve to keep the harrow level and prevent it from pitching forward with the timbers upon the ground. After the front set are cleaned, the lever is set straight and the rear lever is operated so that the rear pair of harrows will undergo the same operation and become cleaned. A pair of wheels may be attached to the rear of the harrow and support a seat.

## The Mines and the Suto Tunnel.

A meeting of the superintendents of the Comstock mines was held in Virginia City on Tuesday. There were present: E. A. Schultz of the Bullion, Exchequer and Justice; Judge Strother, of the Baltimore and American Flat; Chas. Foreman, of the Overman and Caledonia; N. C. Hall, of the Silver Hill; Mr. Perkins, of the Dayton; Hank Smith of the Belcher; Capt. Taylor, of the Yellow Jacket; Lon. Hamilton, of the Imperial and Alpha; Cal. Derby, of the Alta; J. L. Requa, of the Chollar; P. Deidesheimer, of the Hale & Norcross; Cal. Gillette, of the Savage; Col. Osbiston, of the Gould & Curry and Best & Belcher; W. H. Patten, of the Con. Virginia and California; Capt. Hardy, of the Ophir, Mexican and Union Consolidated; Chas. Bonnemont, of the Sierra Nevada; Jno. W. Mackay and Frank Thayer, of the Julia. The meeting was called to order by Mr. Requa, at half-past two. The necessity of action of some sort, with regard to the Suto tunnel, was admitted by all, and a committee was appointed to examine into the question in its various bearings, including the cost of the tunnel, the benefit it is likely to be to the mines, the cost of pumping water to the surface from the tunnel level, etc. The Committee is to report as soon as possible. The Committee is composed of Messrs. Schultz, Requa, Foreman, Patten and Taylor. John Mackay was called upon by the Associated Press reporter after the meeting. He said the Committee would labor both in Virginia and in San Francisco, and thought they would make their report in two or three weeks.

Mr. Suto says his tunnel will have cost \$5,000,000 by the time it shall have reached the Comstock, and he wants the mining companies to pay him interest upon that amount. The opposite party, however, claim that the cost was not over \$2,000,000, and do not favor Suto's proposition. This Committee is to ascertain the exact cost of pumping or draining the water from the various mines of the Comstock from the level of the Suto tunnel to the surface, a distance of 1,650 feet, or thereabouts, also the cost of pumping up the level of the tunnel, and, in short, ascertain just what the companies can afford to pay for the privilege of allowing the water to flow out through the tunnel.

## The Worcester Drill.

We give herewith an engraving of the Worcester upright self-feeding drill, of which several styles are kept in stock by Dunham, Carigan & Co., of this city. The No. 3 upright drill shown is arranged with slip gear, by which a quick or slow motion may be given the drill, for light or heavy work. In the late patterns of this size on the same shaft as the crank are light and loose pulleys, so that the drill is available for either steam or hand power. The handle may be removed by releasing a set-screw. The drill is arranged so that Morse's twist drills may be used without having to buy a chuck for them, as all sizes of these drills are made to fit. A drill of this size, in this city, has been made to drill even as large as inch and a half holes, but they are intended for smaller work.

|| \$1,500.

\*\* \$4,709.72.

†† From Whisky Run to Coquille river, Oregon, the beach sands, formerly very rich, have been extensively worked for three or four miles along the sea-coast. The productive stratum was a layer of black sand, one to two feet thick, buried from two to five feet below lighter sands. The gold occurs in minute particles. This sand likewise contained some platinum and iridosmine.—Ext. Trans. Cal. Acad. Sciences, W. A. Goodyear, of the State Geol. Survey, § Strabo, book iv., chap. vi., sec. 12. Foot-note Siberia, p. 449.

## The Wheat Fields of the World.

It will, no doubt, be of considerable interest to all to take a look upon the wheat fields of the world and gain the facts of the growing season lately closed. Our source for such information is naturally English, because as the grain is thither hound for a market, reports center there also. We find in the writings of H. Kains Jackson, in the London papers of the week ending September 17th, a general survey of the wheat harvests of the leading producing countries, and therefrom we cull notes of interest.

As regards the home crop in England, it is proving even worse than former advices have indicated. Mr. Jackson concludes that it is 20% deficient for the United Kingdom and furnishes only 10-23ds of the total required by the nation for consumption. This shows the opportunity for foreign grain. Now what is available for supplies?

Egypt is known to have had a good crop, the Vienna estimate giving a wheat surplus of nearly 2,000,000 qrs. from a yield of 25% above an average. In support of this view the export has been large, yet only on a scale that promises a total supply of 1,250,000 qrs.

Spain, from the southern climates of its coasts and plains and the elevation of its central plateau, where much wheat is planted, has a long irregular harvest period, and violent storms and floods since May have greatly reduced the promise of the earliest harvest gatherings, which were exceedingly good. However, of wheat and flour, Spain may well export 500,000 qrs., much of which will probably be taken by Mediterranean ports.

Italy, Sicily, etc., are reported at Vienna to have an average crop of wheat and barley, but cannot be considered a surplus-producing country, and is likely therefore merely to exchange by import as much as may be exported.

California and Oregon have been very unequally favored this year, the first State having a deficient, the latter a full crop, and together are expected to supply the United Kingdom with 1,500,000 qrs. of wheat. Want of rainfall is the cause of failure in California, the breadth under cultivation being still increasing.

The United States acknowledge a full crop in their earlier Southern States, and a large yield in the great wheat-producing States of Minnesota, Iowa, Wisconsin and Kansas, whilst Ohio, Indiana, Kentucky and Tennessee and Michigan have extra crops. As a result there should be an export power of 8,000,000 qrs. to 9,000,000 qrs. of wheat and flour, out of which the Continental and other buyers may take 2,000,000 qrs. from the United Kingdom.

Russia (north and south) is reported to have generally a large crop—an average in the north, an excess in the center and southern governments, and a deficiency of 13% in Poland. Many important districts acknowledge the yield to be more than double that of 1876. The capabilities of export cannot, on account of the war, be weighed with any certainty. The proportion usually coming via southern ports is extreme—15,775,000 cwt. in 1872 coming against 2,080,000 cwt. from northern ports. In most recent years the difference would be as four to one. With a harvest power of exporting 5,000,000 qrs. that power will probably be crippled for the next six months by half the quantity, and, as a result, America will rule the British market, restricted only by the interests of her own competitive sellers.

Germany is believed to have a moderate harvest, 5% short in Prussia, above an average in Saxony, Bavaria (South, Upper and Lower), 15% short in Baden, 5% in Wurtemberg, an average in Mecklenburg. Able to ship 1,250,000 qrs. of wheat in good seasons, that quantity may be expected in 1877-78 from German sources, and possibly another 500,000 qrs. from other sources that will be forwarded via German ports.

Austria and Hungary, with fair reason exult over good crops; wheat 12, rye 5, and oats 2% over an average, and barley an average yield. The weight of grain is very satisfactory in Hungary. The Vienna estimates promise a surplus for export of about 1,750,000 qrs.; but, judging from the small receipts of many previous years, the United Kingdom is not likely to draw 1,000,000 qrs. of wheat from Austro-Hungary.

France, wanting for consumption and seed about 95,000,000 hectoliters of wheat, is estimated to have grown but some 85,000,000, and to have no reserve. Allowing that France has sufficient wheat for actual consumption, the country is yet likely to import for reserve, and in exchange for flour, fully 3,000,000 qrs. of wheat, and cannot be regarded as a source of British supply.

British North America has fine grain crops, and is believed able to export 1,000,000 qrs. of excellent wheat.

Of the other countries in whose harvest we are interested, Chile and Australia, the crops promise to be good and early, harvest being expected to begin in November in the southern hemisphere. East India has been and is still a source of liberal supply for the last two seasons. A good crop was grown this year, and has been shipped freely. For the moment the calamitous famine at Madras is diverting trade; but changes from scarcity to plenty are quick in Hindostan, and the United Kingdom may certainly rely on fully last year's wheat supply coming from India.

In respect to price Mr. Jackson says: As hidden by Mr. Caird, I am "thankful they are no higher" for the household loaf. Evidently there is little chance of wheat dragging the market before the coming of another crop.

## Changing Shift.

### Novel Scene at the C. & C. Shaft.

To see the miners who delve in the steaming lower levels of our mines changing shifts is a sight quite novel to persons of the upper world, as it is to be witnessed at almost any of our principal mining works, but is particularly so at the C. & C. shaft, now that the new changing room has come into full use.

As the men are popped up on the cages from the sweltering regions below in their underground attire we see them rush away and hastily descend a stairway leading to the floor below. We follow them and a short distance from the foot of the stairs enter with them a large room from which comes a blast of heat and steam.

At the first glance we are reminded of the steerage of some large ocean steamer. The room has the same close smell, and many racks for clothing not a little resemble the crowded berths found on an ocean steamer. The rows of these racks are so close together that one can see but a few feet into the room.

Down the alleys, between the lines of clothing rush the miners toward the further end of the room, where there is a sound of splashing and falling water. Moving in the same direction we come upon an open space of some feet square, in the center of the room, in which we find a huge stove. This stove is made of a large steam drum, into which grates have been fitted, and in which a rousing fire is burning, making the place much too hot for outsiders, but apparently quite comfortable for the miners, just out of hotter regions below.

Passing to the end of the room where the splashing of water is heard, we find a crowd of men in all stages of preparation for leaving the mine. In one corner of the room, partitioned off by a screen some six feet in height, are the shower baths. There is both warm and cold water, and under the showers the men wash themselves before putting on their outdoor clothing. They perform their ablutions very rapidly, and also get into and out of their clothing with a celerity that shows much practice on the double-quick at that business.

The moment a man is dressed in his surface suit he picks up his underground rig and goes to a long and large washing trough, containing warm water. In this trough he speedily washes the woolen shirt and pants he has worn during the eight hours he was at work below, wrings them out and hangs them on his own particular hook, then takes his heavy mining shoes in hand. He plunges these into the trough, washes them both inside and out, and then places them on a shelf over the book on which hang his hat, shirt and pantaloons, when he makes a break for home.

Thus it will be seen that the miners, on coming out of the mine, wash everything they wore in the lower levels, except their hats, and even these it is probably necessary to wash occasionally.

As the principal object in washing their clothing is to get rid of the perspiration it contains, it is very quickly performed. A shirt is merely drawn rapidly back and forth a few times through the hot water, when it is wrung out, and the same with pantaloons. Any clay that may be sticking to the clothes is as speedily washed away as is the perspiration.

Owing to the great heat of the room the clothing thus washed soon dries and is ready for the miner when it is his turn to again go below. He then dons his mining rig and leaves his surface clothing on his hook. In this room some 500 miners change. There are in all 1,300 hooks. Counting each man's suit at \$10, the room would be found to contain clothing to the value of \$5,000, and enough in quantity to fill a very large second-hand clothing store. Valuables of all kinds are often left in the pockets of the clothes, but we never hear of any of these being lost.

Although to an outsider the room seems close and steamy, there is nothing like an offensive smell to be perceived. The hooks are not numbered—indeed, they are so close together that there is no room for numbering—yet every man appears to know just where to find his rig.

Yesterday being pay-day, the men made their changes with a rush; with a rush they went to the time-keeper for their checks, and, receiving these, started up the hill, like men running a foot race, for the principal office at the Con. Virginia works, to get their money. Thus there was to be seen a string of men running as if for their lives, each with his check fluttering in one hand and his dinner pail swinging in the other. This scattering line of racers extended from the C. & C. shaft some 2,000 feet up the hill, to the Cou. Virginia office.

At the office named they formed a long line, as is often seen at postoffices, each man getting his money in his proper turn, and it was in order to get in this line as speedily as possible that the men were seen to make such fast time up the hill from the C. & C. shaft.

It was a bad day for the children and others waiting to get lunches from the dinner pails of the men. In vain the youngsters shouted and held out their hands; the miners darted past them like quarter horses. They had no time to stop to fill aprons, baskets or hats, when they thought of the long line of men dragging their slow length along up at the main office, and of the bright double eagles that were being chinked into horny palms.—Enterprise.

## Heat in the Silver Mines.

Those who have never personally inspected the lower levels of our mines may obtain some idea of the degree of heat to be found therein by visiting the Savage works at the change of shifts. The men—packed together as close as they can stand on the cage—are popped up out of the shaft all steaming hot, for all the world like a bunch of asparagus just lifted from the pot. They make their appearance in a cloud of steam that pours up continuously from the "depths profound," and are dimly seen until they step forth upon the floor of the works. As the men land and separate, each carries with him for half a minute his little private cloud of vapor. As this passes off the man is seen to be naked from the waist up, his skin as wet as though he had just been lifted out of a pool of water. The men bring up with them—besides the steam—an amount of heat that may be felt by the spectator as they pass.

All this is at the top of the shaft, where it is considered quite cool—what, then, must it be hundreds of feet below, where the men started from—down where the water stands at 157° Fahr.? Down there no steam is seen—it is too hot for it. It is only when the hot, moist air coming up from the lower regions strikes the cool air towards the top of the shaft that it takes the form of steam. Down where the men come from you must keep your hands off the pump column and the pipes, and if you pick up any iron tool you will at once put it down without being told to do so. Down there they handle things with gloves on, or wrap rags about the drills they are guiding and iron apparatus they are moving, and down there, too, you will learn to keep your mouth shut after you have drawn a few mouthfuls of hot air into your lungs.

Perspire? It is no name for it. You are like a sponge that is being squeezed. You are ready to believe that you have ten million pores to every square inch of surface, or as many more as any authority may mention, and that all these pores are as big as the cells of a honey-comb. You go for ice water, and it almost seems to hiss as it passes down your throat—you keep going for it, and thus, in a short time, find out what becomes of the tons and tons of ice that are daily consumed in the mines. Remain below among the miners for an hour or two, and when you are finally popped out at the top of the shaft, all red hot and steaming, among the other asparagus sprouts, you will appreciate the beauty, the light, and the coolness of the upper world.—Virginia Enterprise.

## Mineral Discoveries in Utah.

The Salt Lake Tribune says: A great deal has been said and written of the mineral wealth of Utah, but the half has not yet been told. Every day brings some new discovery to light, adding to our untold resources. Salt Lake, Tooele, Beaver, Juah and Washington counties all boast of their rich and extensive gold and silver mines, to say nothing of their inexhaustible lead and copper deposits. But it remains for Utah and San Pete counties to come to the front with their great coal fields, immense beds of shale and asphaltum.

Within the past month or two, shale beds, miles in extent, equal to the best in the world, have been discovered in these two counties, and companies are now forming to place it in the market. It is rich in gas and oil, and if a demand can be created for it abroad, it will be a great source of revenue to the Territory.

A short time ago, the ever-active prospector, while scratching around the hills of San Pete, came upon an extensive body of asphaltum, which has hitherto been an article of import in Utah. It is used extensively for roofing, paving and other purposes, and now that it has been found in such vast quantities right at our own doors, the time is not distant when the streets and sidewalks of Salt Lake can be laid with it at a cost far below that of any other paving material. The largest croppings of this material are found on the Thistle branch of Spanish Fork, 18 miles from the Utah Southern railroad and two miles from the narrow-gauge road now already graded from Spanish Fork to Pleasant valley. It is said this asphaltum, with the present facilities for shipping, can be laid down in Salt Lake for \$9 per ton, and when the narrow-gauge road is completed to the Utah Southern terminus, it can be carried with profit for \$5. It is anticipated that the narrow-gauge road will be completed early next spring.

The other late discoveries in San Pete and Utah counties are mineral pitch, alum and paraffine in large quantities.

## The California Battery Mill.

The capacity of the California battery mill is to be increased by the addition of 20 more stamps. The work of the contemplated addition is already well under way, the blacksmith shop at the end of the battery having been removed and the end of the building taken off. A large amount of the lumber therefor is on the ground, several carloads having been received yesterday, and the work of framing the timbers is being pushed right along. Col. Fair expects to have it about ready to run in 30 days.

The pan mill has always had a capacity greatly in excess of that of the battery mill, and the proposed addition will make them both about equal. Of the Consolidated Virginia ore now subjected to the 60 stamps of the battery, 350 tons per day are reduced. When the addi-

tion contemplated is completed, the capacity of the whole mill will be from 460 to 480 tons per day.

The reasons for this enlargement are numerous and weighty. The ore is run from the C. & C. shaft directly into the battery mill, thus saving costs of transportation. The pulp is carried from the battery mill to the pan mill through a flume, and by water, and again the cost for transportation is nothing. The ore is worked closely at the mill and, above all, the amount reduced is steady and the work reliable. The company have fine mills on the Carson, but in such times as these they cannot be relied on for work, on account of the want of water. The Brunswick, for instance, with its capacity of 4,000 tons per month, is not reducing now over 40 tons a week. All these considerations show the wisdom of the movement above mentioned, since the mines have ore enough in sight to warrant it and to keep the mill running indefinitely.—Enterprise.

## The Aztlan and Senator Mills.

Parties visiting these mills, yesterday, report everything progressing satisfactorily. At the Aztlan, where they only run the batteries four or five hours per day, for want of pan capacity, and occupy the remainder of the 24 hours in working up what is crushed in that short time, the batteries were silent; but the pans, two in number were busy stirring up the silvery mass and getting ready for another 1,600-pound charge for the retort, that being the weight of the charge then being retorted by Mr. Hayne, who had his retorting furnace nearly red-hot at that moment. This mill has been shipping two bars by each express of late, the two aggregating between \$3,000 and \$4,000; but since the lower north tunnel in the Peck mine has passed the working shaft and got into a superior quality of ore, they find it necessary on this occasion to run three bars instead of two. These three bars Mr. H. was getting ready to cast when the party left.

At the Senator everything was booming. The new dry-crushing mill, with the barrel process, is now in full operation, with an extensive roasting kiln for the desulphurization of the ores. The water, which had increased to an ample sufficiency during the late rains, has begun to fail in the well, and Mr. Frederick has again turned his attention to bringing water from the mine in troughs to supply the engine and settlers. This will be completed within a few days, and then there will be no more delay for want of water, as the mine makes a large quantity that the miners are anxious to get rid of. The barrels are tumbling away day and night, and have been for nearly a week. When a clean-up is made of this run it will test the capacity of the barrel process to save the gold in this refractory ore more thoroughly than has hitherto been done in Arizona. If it shall prove that this or any other process will work this ore cheaply and save even half the gold that is in the rock, the Senator is a grand success, because the supply of ore is immense, and its richness beyond question. The only drawback has been and is the rebellious character of the ore, which is full of all manner of the most stubborn mineral known to amalgamators. If bull-dog courage ever leads to success, surely S. O. Fredericks will triumph in the end, for there is no let up to him. The outlook at present is flattering, and everybody hopes and believes that he has hit upon the right process and that henceforward he will have plain sailing on the way to fortune.—Arizona Miner.

A GRIEVOUS CATTLE DISEASE IN OHIO.—A dispatch from Cleveland, Ohio, says: A terrible cattle plague has broken out in the suburbs and the country surrounding this city. The veterinary surgeons of the vicinity have carefully investigated it, and pronounce it a species of Texas fever. It originated probably by the importation of Texas cattle. This year these animals are covered with ticks of two varieties, whose bite is a deadly poison. The blood impregnated with the virus of these ticks flows to the liver, where it destroys the delicate secretory membrane, and from there to the kidneys, whence it is passed to the bladder. The disease was at first thought to be red water. Cattle are dying daily. The milk and beef are impregnated, and the animals are often so far gone before they are known to be ailing that no help remains for them. Several cases of children being poisoned in the city from partaking of the milk have already come to notice, and the people are thoroughly alarmed. The Leader will publish, to-morrow, a long statement from a surgeon who has treated more than 40 cases, and made a careful post-mortem examination of the bodies. He says that it can be cured if taken in time. His plan is to wash the animal with a lotion, which acts as a disinfectant for the ticks and an antidote for the poison. The affected beef is quite readily detected by a skilled eye. The fatty portion is brownish yellow and the lean quite red. When exposed to the air for a short period, this meat becomes putrid and of a dark brown color. The disease is very infectious. Cattle become infected by contact with the virus deposited upon the grass by diseased cattle while feeding, and by drinking from a stream which has flowed through a pasture containing diseased cattle. The plague will prove very disastrous in this dairy section if it is not immediately checked. The symptoms are a heavy falling off in milk, and bloody urine. Death follows in a few hours.

## A VALUABLE MINING BOOK

BY J. S. PHILLIPS.

The Explorers' Miners and Metallurgists' Companion, 6x2 pages, 83 illustrations. Second Edition. A California publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—*London Mining Journal*.

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—*Mining and Scientific Press, San Francisco*.

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*S. F. Golden Era*.

He has rendered to the leading industry of the coast a valuable service: has furnished the millman and miner a safe and much needed practical guide.—*Overland Monthly*.

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—*S. F. Commercial Herald*.

This book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*S. F. Daily Alta*.

In the several sections the work is eminently practical. It is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—*S. F. Daily Examiner*.

It affords a vast quantity of information as to the appearance and value of different ores.—*S. F. News Letter*.

It is the best single English treatise we know for the use of prospectors and practical miners.—*The Engineering and Mining Journal, New York*.

Sold by Dewey & Co., at this office. Price \$10 50.

## Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the heading of "Working Ores" the author describes Aaron's process has something to say of superheated steam, preparation of dichloride of copper and protoclauride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring heat of furnace, want of sulphur, etc. Under the heading of "Leaching Processes" are the following: Smelting, Mexican process, Chilean process, Krichke's process, etc. Under "Pulverizing Machines" are described the arrastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, giving the core, directions for making a barrel, giving the mechanical wear, use of quicksilver, copper in bars, a cheap barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tallies and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansome Street, San Francisco.

## Questions of the Times.

Which are the most reliable watches?

American watches, they are driving those of foreign make out of the market.

Which is the best American watch?

The New York watch, made at Springfield, Mass.

Why is it the best watch?

Because it is substantial in all its parts, constructed on the best principles and embodies those improvements which experience has shown to be the most desirable.

Why is the New York Watch so popular?

Because in buying one you are sure of getting a good time-keeper. While purchasing a watch of most other makes is like investing in a lottery—a great many blanks to one prize.

Which is the cheapest watch?

The most economical is the New York watch. For you can get one of these excellent time-keepers for less than it costs in a short time to patch up a poor watch, which benefits no one but the repairer.

Where can I get a New York Watch?

By addressing the long established, practical Watch-makers and Jewelers, DEWEY & JORDAN, 433 Montgomery St., San Francisco, who will send you a descriptive price list, including the following styles of movements: "John Hancock," Geo. Sam. Rice, "Chas. E. Hayward," "Aaron Bagg," "Theo. E. Studley," "Chester Woolworth," "Frederick Billings," "Railway," "John L. King," "E. W. Bond."

## Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers, S. F.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL.

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick-silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Subphosphates, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

## Designing and Engraving at This Office.

## Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY &amp; CO.

## ARITHMETIC MADE EASY.

ROPP'S

## EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months.

The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Granaries, Bins, Wagon Beds, Corn Cribbs; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mechanical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided. The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter or receipt by express. Address

Belting, Packing, Hose, and Other Mill and Mining Supplies on Hand.

Send for Illustrated Catalogue.

## GREAT ENTERPRISE.

THE

## Sierra Flume &amp; Lumber Co.

HAVE OVER

100,000 ACRES OF SUGAR PINE,

Yellow Pine, Spruce, Fir and

Cedar Lands.

10 Saw Mills, 3 Planing Mills, 1 Sash and Door Factory,

149 Miles V Flumes, 10 Miles of Tramways

157 Miles of Telegraph Line, 13 Telegraph

Stations, and Employ 475 Men

and 550 Oxen and Horses.

The Sugar Pine is unsurpassed in quality, and the whole Coast can be supplied.

The Yellow Pine is firm, fine grained and superior to any other hard pine for Flooring, Stepping, etc.

The Spruce has great strength, durable when exposed, and especially adapted to Bridge and Ship Building, while the Fir and Cedar are as valuable for a great variety of purposes.

Last year thirty millions of feet were cut and the estimate for 1877 is fifty millions; fifteen millions are now on hand, thoroughly seasoned by the hot climate of Red Bluff and Chico.

Large orders can be filled on a day's notice for kinds of

## BUILDING MATERIALS,

Rough or dressed dry, by which elegant and substantial work may be accomplished without delay at the usual cost for green lumber.

Orders for the interior filled at less than San Francisco prices and freight.

Doors, Sash and Blinds always on hand in large quantities. Address

## SIERRA FLUME AND LUMBER CO.,

PRINCIPAL OFFICES:

Red Bluff, Chico; San Francisco—Corne

Fourth and Channel Sts.

## MANHATTAN

## FIRE BRICK AND CLAY RETORT WORKS,

ADAM WEBBER, Proprietor.

Office—633 East 15th Street, New York.

## CLAY GAS RETORTS, (Glazed and Unglazed,

Ons House Tiles, Fire Bricks, Blocks, Etc. Around Fire) Brick, Fire Clay and Fine Sand always on hand. Assay Muffles and Furnaces, Cupola Bricks for McKeezie and other cupolas.

## MINERS, ATTENTION!

In reference to the advertisement of Mr. H. C. Perkins, warning miners against using my patent Deflecting Joint for hydraulic pipes, I want it distinctly understood that I fully guarantee all my customers and will defend all suits. I think it is probable that by the time Mr. Perkins gets through he will realize the difference between commencing a lawsuit and winning one.

RICHARD HOSKIN.

Dutch Flat, Sept. 17, 1877.

25 ELEGANT CARDS, no two alike, with name, 10 cents, post paid. J. B. HUSTED, Nassau, N. Y.

(Continued from page 245.)

of good ore, and Woodruff & Co.'s Zagomanique, a 13-foot vein, a part of which samples high, and the Hidalgo, Pilate and Cubb. The Policy, owned by Garret & Dorr, has been turning out good ore and the vein is well defined. The White Pine has been paying handsomely. Waite & Co. are preparing to go to work on the Alta, a promising lode. Quite a number of other lodes are more or less developed, and have been proved to contain paying ore. Some high grade ores were recently found in the Strawberry and in the Keystone. The Mill creek mine now employs more men than any other, and is paying well with plenty of ore in sight.

At the present time Pony is considered rather dull, but the resumption of work by the Moreland mill and the starting of the Lehman mill will give a new impetus to business in a few days.

### Idaho.

POTOSI.—Owyhee *Avalanche*, Oct. 13: At the Potosi stoping is being prosecuted on an extensive scale. Both north and south the ledge is growing larger and richer as the work progresses.

At the Belle Peck the main tunnel is being run into the mountain and good progress is being made with the work. That part of the ledge which the present work aims to reach will soon, it is believed, turn out to be an immense bonanza, and this belief is shared in by those who are familiar with the formation.

EMPIRE.—Work progressing without material change of prospects at the Empire. The stopes in the vicinity of the 6th level are yielding well. Sinking towards the 5th level is progressing favorably, and the shaft will be timbered and completed about three weeks hence. A cross-cut will shortly be commenced on the lower level.

GOLDEN CHARIOT.—The work of sinking is progressing rapidly at the Golden Chariot, and everything about the mine wears an active and prosperous look.

Mr. MARTIN has discovered an immense ledge in the vicinity of the Poorman, which he has called the Ellsworth.

THERE is every prospect that the Poorman will be started up in a week or two. Mr. Baldwin and several other gentlemen are making an earnest effort to this effect in San Francisco.

GAMBRIUS DISTRICT.—Cor. *Idaho World*, Oct. 6: All is life and bustle around the new mines. The boys are working day and night in the Golden Gate. The vein is now cut into the levels for a distance of 45 feet, and still the pay continues. About 20 feet from the shaft, on the west drift, a change in the formation of the ground took place, throwing the ledge about two feet into the hanging wall. The boys were in doubt as to whether the ore would continue beyond this break, and several dismal countenances might have been seen, for a few hours only, as in a short time the back wall was encountered and the vein again found far better than before. The ore now found in the face of the drift will go at least \$250 per ton. The levels will be pushed ahead with all speed for some distance, when stoping will be commenced, the rock crushed and a clean-up made that will astonish the natives. It has been rumored that the Forest King had given completely out, but a glance at the premises to-day will convince any one to the contrary. It is true, however, that the rich lode of ore that was first struck in the cut did not continue for any distance, nevertheless it is liable to come in again just as quick as it went out. It's a poor rule that won't work both ways. The ledge is still well defined, with good clay walls. The shaft is now down about 15 feet, and one-half the rock taken from it is pay ore. The Sub Rosa needs no comment. All that is necessary to make one long to be in the place of one of the miners, is to just peep into the battery. If winter does not set in so early, they will, beyond a doubt, clean up \$75,000 this fall.

### Rickard's Oxidizing Furnace.

This furnace is constructed on a simple and inexpensive plan, which retains all the well-known advantages of the old reverberatory, combined with some novel applications of chemical and mechanical forces, which expedite its oxidizing, sulphating or chloridizing action without entailing any additional expensive machinery or special technical skill in the management.

It consists of an ordinary three-hearth reverberatory furnace, fitted with the usual fire-place, discharge holes in floors and working doors; iron pipes or brick flues are carried round the lower hearth, through the fire bridge, and terminate in a horizontal orifice, in the throat or gorge of the furnace.

Through these pipes or flues, a powerful blast of air is sent by means of a fan, or other blower, which, being raised to a red heat during its passage, strikes with considerable mechanical force a shower of pulverized ore which enters the furnace from another horizontally elongated orifice, placed two inches above this hot air blast; the supply of ore being regulated by a screw, with a conical pulley working in a hopper, which conveys it into the vertical passage terminating in an elongated ejection. The screw is worked faster or slower, according to the character of the ore being operated on, or, in other words, the quantity of sulphur, arsenic or metal which has to be oxidized or burnt off—for instance, ores containing 15% to 20% of sulphides or arsenical metal, may be introduced at the rate of a ton an hour into a medium sized furnace of say 10 by 5 feet hearths, while those carrying higher percentages of pyrites or other oxidizable matters, must be fed more slowly, till the maximum quantity shall have been determined by the operator.

The mechanical effect of the hot-air blast is to scatter the ore all over the three hearths of the furnace, previously brought to a bright red heat, but not beyond, by the ordinary firing; the heavier (larger) particles falling on the bottom, while the lighter (finer) portion is carried by the blast on to the two upper floors, and finally into the extensive dust chambers attached, where the continuous force of the blast keeps it in motion, scattering it through the atmosphere, and exposing fresh surfaces on the floors much more effectually than can be accomplished by any raking motion, either by hand or by any system of machinery, both of which involves a serious outlay, fatal in low-grade ores, while this arrangement performs the mechanical work at no cost beyond the insignificant item of power to keep the blower in

motion. The coarse ore, falling on the bottom hearth, is acted on by special hot-air jets, proceeding from the fire bridge and sides of the furnace.

Its chemical effect is produced by the introduction of the largest possible amount of oxygen, in the form of atmospheric air, at a high temperature, which, it is claimed, will not cool the furnace, uncontaminated by the products of combustion, as is the case with roasting furnaces hitherto in use. The oxygen is consequently in the best possible condition for combining with the sulphur and other matters in the ore to be oxidized; which, being by the force of the blast simultaneously spread in a finely divided state, over a large and ever-changing heated surface, is almost instantaneously attacked by the oxygen and either thrown off as a gaseous product of combustion (SO<sub>2</sub>, etc.), or retained in the furnace as a metallic oxide.

When it is considered that a ton of pyrites ore requires about its own weight of oxygen to roast or oxidize it completely, by converting the sulphur into sulphurous acid gas, and the iron into a state of peroxide; and, that a cubic foot of air contains but a quarter of an ounce of oxygen, it will readily be seen why the action of the old reverberatory furnace has been so slow and costly; incessant labor having been necessary to rake over the ore, in order to present fresh surfaces to be oxidized by the limited supply of oxygen which found its way into the furnace through the fire bars and fuel, the air having performed its duty as a supporter of combustion on the carbon and hydrogen of the fuel, had very little oxygen left available for the purpose of desulphurizing and oxidizing the ore. Hence, its abandonment in the Pacific States, where the cost of labor and fuel would only admit of its use in cases where the richest kinds of ore were being reduced.

The numerous improvements which have been made in roasting and chloridizing furnaces, within the last few years, present some very ingenious and effective mechanical arrangements for scattering the pulverized ore in the flame and doing away with the expensive hand labor of raking; but most of them involve a heavy cost in current working charges, in addition to the wear and tear of the indispensable machinery, and also fail in the essential point of furnishing the necessary oxygen in such quantities, and under such circumstances as to produce almost instantaneous oxidation, *i. e.*, perfect roasting, either by chloridizing, sulphating or other condition desired for the further treatment of the ore through the instrumentality of the all important element, oxygen.

Another very valuable and economic effect produced by this introduction of large volumes of hot air, is the complete combustion of all the fuel used, not a particle of which can escape in an uncombusted condition, as soot; the result being a maximum roasting effect with a minimum supply of fuel.

By the time the hot blast has passed through all the dust chambers and reached the chimney, it has become charged more or less with fumes of sulphurous and sulphuric acids, which, being brought into contact with steam, air and water, (aided by nitrous fumes evolved in the dust chamber) which are introduced by suitable pipes and taps, into the tower, are converted wholly into sulphuric acid (as in an ordinary vitriol chamber), which is collected in a lead vessel at the bottom of the shaft, furnished with an overflow pipe which communicates with another larger vessel of the same kind, sunk in the ground in any convenient part of the premises, from whence the acid may be pumped up from time to time, and used for washing tailings, where copper ore has been operated on by the "Hunt & Douglas" or other lixiviating process, blue-stone making or for other purposes.

It is claimed that by a careful attention to the requisite temperature and other essential conditions, copper ores may be sulphated to a higher percentage in this furnace than has hitherto been attained by any other system of roasting.

When used for chloridizing silver ores, the highest practical results are obtained with from one-third to one-half less salt than is now being consumed by the very wasteful and unnecessary custom of introducing it into the furnace with the raw ore, by which the greater portion of it is converted into sulphates of soda, lime, alumina, and other useless and valueless products before its chlorine commences to act on the silver contained in the ore. By simply mixing the actual quantity of salt necessary to accomplish the chlorination of the silver with the roasted ore on the bottom hearth of the furnace (after adding the ore from the two upper hearths for the purpose) for about a quarter of an hour before withdrawing the charge, a most perfect chloridizing effect will be produced, enabling the ore, we are told, to be worked up to 90% or 95% of its assay value.

In addition to the advantages already stated regarding its power for rapid and cheap oxidation, chloridation, etc., it can be worked at a very small expense, only two men (*viz.*, one to feed with another to fire and discharge) being required on a shift, or four to the day of 24 hours, during which time, while roasting 20 tons of ore, its consumption of wood will not exceed three cords (usually not over two and a half), in consequence of a suitable moderate temperature being steadily maintained (overheating being carefully avoided), and the complete combustion obtained by the introduction of heated air, thereby avoiding the customary loss of fuel (30% to 50%) entailed through the habitual and almost universal neglect in pro-

viding a proper combustion chamber in roasting and other furnaces.

There being no complicated or expensive machinery in connection with this furnace, its construction is of the cheapest possible kind, involving very little outlay beyond bricks and labor. A model may be seen at the office of Col. J. D. Graham, 302 Montgomery street (Room 14), San Francisco, where all further particulars can be obtained.

### Whited Sepulchers in Finance.

Of what use are exhortations to frugality and economy? Where is the encouragement for the industrious man to undergo the self denials which attend the accumulation of savings? How can society longer urge upon its members the rule of "a penny saved is two pence earned?" Of what use to glorify that method in industry which determinedly lives within an income and sets aside a part of the receipts from each day's labor, so that the laborer may triumph over hardships and unseen reverses which are the lot of all men!

Such thoughts arise each time there comes tidings of the failure of a savings bank. Far too frequently of late it has been shown that some establishments which extend the most flattering incentives to frugality and the accumulation of savings, have proved delusions, snares and traps of the most outrageous character. By their offers of large reward for savings they have awakened the provident desire, and then, by their wreck and ruin they destroy the spirit and ambition utterly. They injure society far more than can be measured by the count of the dollars of which they rob the unwary. They excite general distrust. Their legacy to society is oftentimes woe and want, and they always impart disheartening discouragement which paves the way to prodigality and recklessness. They are an insidious and unmitigated curse to a community. For the welfare of humanity it is plain that their uprising should be impossible. Foul financial fungi, they attach themselves to the word "saving," which is the keynote of a noble industrial independence, and transform it into a by-word, a symbol for deception and destruction.

How long will society tolerate such clogs to its advancement? We need not now instance the savings frauds which came to light three weeks ago in Chicago. They were enough to raise the indignant ire of honest men the world over, but we have illustrations nearer home. What a spectacle is presented to the enlightened contemplation of the nineteenth century in the events which are now transpiring in this city. What does the name Duncan now signify to the people of California? A vulture, gorging itself upon the fruits of other's industry; hiding its foul character beneath the cloak of honorable enterprise; maintaining its evil banquet until the last Saturday night's earnings were seized upon, and then disappearing under cover of a night, which was light indeed when compared with its criminal blackness.

What a reflection it is upon the wisdom of a people when it is possible that a president of a savings bank should be able to vanish after having hopelessly destroyed more than a million of the hard earned dollars of hopeful toilers. What does it mean when a financial trap is sprung in the sight of the community, and all its resources are seen to be a lot of unpaid-for furniture and gilded signs—mere bait to allure its victims to destruction? Is a people just to itself when the sacred word "Fidelity" can be made a synonym for "fraud"?

These are considerations of the widest and deepest practical importance. It would be a wholesome warning to swindlers in high places if all the scoundrels which have of late robbed a trusting people should be awarded full punishment for their crimes, and so we hope they may be. But this is a small part of the lesson which recent events should impart. The public itself has a lesson which should be learned well and quickly. The times call not alone for punishment, but for prevention. Let not the people rest with duly punishing an evil deed, but let them make such deeds impossible. This is plainly both in the interest of honest banking and honest saving. No sound and honest public institution should object to having its resources carefully examined in the public interest, so that all may know the extent of its actual resources and the character of its securities. Honest, safe, conservative financial institutions, which are the safeguards of industry and commerce, should court such investigation as the best possible advertisement to the public of their condition. Those which are dishonest, reckless, and based upon promises of doubtful value, or enterprises of unproved character, may well fear, but should not escape inspection in the public interest. We have laws concerning banking and other public institutions it is true, but of what value are they if they permit good reports both from honest men and swindlers? Nets which catch good and evil fish only become of value when good are received and the bad rejected. Evidently laws are but delusions, and reports a snare, unless there be the further ability to discover what claims are true and what are false. It is but plain justice which a people owes itself, to know beyond a doubt what institutions of trust are enduring monuments of industrial progress and security,

and what are but whited sepulchers—fair without, but filled within with the rattling bones of fraudulent securities, dishonesty and corruption. This is a question which should come before our coming Legislature, and he forced upon their most wise and careful examination by the recent remarkable disclosures. Let us have some test by which a people shall know which, of all the establishments which don the garb of trust and security, have within their vaults that which has the true ring of honesty and honest metal, and which have but gilded furniture—traps to gather personal spoils, and return a trusting public naught but spelter. This is a crowning necessity of the time. Let not the people's representatives shrink from securing it.

Until relief is furnished warning is essential. "By their fruits ye shall know them," is an injunction wise and old. Beware of that which reason does not commend. Shrink from a purchaser who offers greater values than conditions seem to warrant. Hold a tight rein upon confidence when claims of "good things" are freely bantered. Remember that the man or the institution which offers you much more than the current rate of interest for your \$100, could get a \$1,000 elsewhere for less, if his security were worthy of it. Put no fidelity in signs. Jonah was a believer in signs, and he was swallowed. Cling to that which you know is sound and true. When it is plain that the law does not protect you, be wise—protect yourself.

DO NOT GO TO GUATEMALA.—The United States Counsel at Guatemala, Mr. Williamson, has written as follows to some gentlemen in this city, who intended fitting out an expedition to prospect for mines in Central America: "In reply to your letter of August 29th, I would say that the mining region has not been carefully examined. Two Americans, who have mined in California, report that it is the hottest, sickliest and most destitute region they have ever seen. They say from their experience a miner could make fair wages there if it were not for the government regulations. The government here does not allow miners to work in the region at present, and you would, I believe, be greatly disappointed if you were to come here. The region is on the Caribbean, north coast of Guatemala, and you would have to travel by land from San Jose, on the Pacific, a distance of nearly 300 miles, to reach it."

MINING STOCK SUIT.—E. B. Dickinson has filed suit in the Twelfth District Court against C. W. Keny, the Cherry Creek Con., Steptoe and Midas, Star and Gray Eagle mining companies, John D. Coughlan and others, for an account and dissolution of a copartnership existing between plaintiff and the first-named defendant, and for an injunction restraining the defendants from disposing of any of the stock of the mining companies named belonging to the copartnership. Judge Daingerfield has issued the restraining order as prayed for, directed particularly to John D. Coughlan, the Star mining company and the Gray Eagle mining company, enjoining them from selling, hypothecating, or in any way interfering with the stock mentioned in the complaint.

TUSCARORA DISTRICT.—There are about 200 houses and cabins at Tuscarora. Building lots are worth \$100. Wood is scarce and sage-brush and coal are used for fuel. The population of the camp is about 1,500, and there are many more there now than can find employment. The cost of living is high, ordinary board and lodging costing \$15 per week, and extra accommodations range from \$4 to \$6 per day. Miners and laborers get \$4 per day, and mechanics from \$5 to \$8. The placer diggings near by are extensively worked by Chinese, and pay from \$1.50 to \$3 per day when there is plenty of water. There are two stage lines to the town, and the place boasts two newspapers. The Grand Prize is the principal mine, the next best being the Navajo, Silver Pine and Independence.

PACIFIC COAST ESTIMATES.—Among the estimates sent to Congress by the Secretary of the Treasury, are the following, recommended by the Engineer department, and transmitted by the Secretary of War and Secretary Sherman, without recommendation: For river and harbor improvement during the current fiscal year: Oakland harbor, \$200,000; Wilmington, \$100,000; Sacramento and Feather rivers, \$20,000; San Joaquin, \$35,000; lower Willamette and Columbia, \$150,000; upper Willamette, \$45,000; upper Columbia and Snake rivers, 30,000; canal at the Cascades of the Columbia, \$300,000; also the following: for fortifications at Fort Point, \$60,000; Lime Point, \$80,000; Alcatraz, \$50,000; San Diego, \$50,000; mouth of the Columbia, \$20,000.

THE work at the Kimball manufacturing company upon the cars and dummies for the California street railroad is progressing rapidly. One dummy is nearly finished, and is a novelty in that line, being entirely different from anything of the kind at present in use.

A SPECIAL from Scranton says: It is believed the striking miners will go to work this week. Four hundred Hyde Park miners resolved to leave the miner's union, and go to work on the terms offered. Troops are ready to move at a moment's notice.

FREIGHT for the new 20-stamp McCracken mill comprised some 185 tons of material, all of which has gone forward except some 20 tons still at Colorado station.

## General News Items.

A GENERAL resumption of work in the Lehigh valley collieries is expected this week.

THE strike of the New York cigar makers has become general. The number of men and women now idle is estimated at 15,000.

ST. THOMAS advices state that a fearful hurricane visited Curacao and neighboring islands on September 23d, and caused great damage.

It is estimated that the famine will cost the British-Indian government £15,000,000, exclusive of the loss of revenue and other indirect effects.

THE India government offers a prize of £5,000 for the best, and £1,000 for the second best machine or process for the preparation of ramie fiber.

ONE steamer at New Haven is ready to sail for Constantinople with 2,150 tons of ammunition, valued at \$2,000,000. Another steamer is preparing.

A WASHINGTON special says: Ex-President Grant, in a letter just received by a relative, states that he has found the labor of accepting the hospitalities of his English friends more arduous than the cares of state.

THE liabilities of Cross & Co., who failed last week are \$600,000 and the liabilities \$400,000. It is probable that a compromise will be effected on the basis of 60 cents on the dollar, and the firm allowed to resume business.

It is now proposed to widen Washington street from Montgomery to East by including in the present 50-foot roadway 40 feet from the south side of the street. Half a million dollars is the estimated expense.

ADVICES from San Domingo to October 5th state that the revolution against the Baez administration was in full force. Puerto Plata was occupied by the revolutionists, who were besieging the fort, and expected its surrender momentarily.

THE Executive Council of the Philadelphia Board of Trade have adopted a resolution declaring the tax imposed upon capital, deposits and circulation of national banks as onerous, and should be reduced, and that a memorial be presented to Congress to that effect.

OUR overland treasure shipments for the first half of the current month were unusually light, amounting to \$646,355, of which \$517,616 was in gold coin. Besides this \$793,535 was shipped to foreign ports, making a total of \$1,439,890. For the past seven months we have been shipping from \$4,500,000 to \$7,000,000 in treasure per month.

THE New York Sun says: The grain crop of the United States this autumn is a vast increase over that of any preceding year in the history of the country. It amounts in the two principal cereals—wheat and corn—to 325,000,000 bushels of the former, and 1,250,000,000 bushels of the latter, according to the carefully prepared estimate of Walker, the statistician of the New York Produce Exchange.

PRESIDENT WILLIAM H. VANDERBILT, of the New York Central; Hugh J. Jewett, of the Erie; Thomas H. Scott, of the Pennsylvania Central, and John W. Garrett, of the Baltimore and Ohio, representing the trunk lines, were in session in New York, on the night of the 15th, considering the propriety of advancing freight rates, and changing the proportion now allotted to each of the four roads in the pooling of the West-bound earnings.

DURING the month of September, 749 passengers arrived in this State by sea, and the departures numbered 1,820, principally Chinese on their return to Hongkong. The total arrivals overland and by sea were 4,162, and the departures 4,852. Twelve hundred more Chinese left the State during the month than came into it. During the nine unexpired months of the present year, our net gain of population by immigration was 16,287, which is 10,000 less than last year, and 36,700 less than in 1875, when the immigration was unprecedented. Of the 84,100 arrivals for 1875, 15,900 were credited to Japan and China, while of the 64,700 last year, 14,700 were credited to those countries. During the past nine months our arrivals from Japan and China have been only 6,700. The Chinese arrivals for the first nine months of 1875 exceeded the departures by 12,275; in 1876 by 10,446, while this year the excess is only 3,102.

THE World announces that a distinguished citizen of New York, assumes the whole expense of removing and putting up the Egyptian obelisk. The estimated cost is \$150,000.

THE San Diego News has it on authority of Mayor Pico that rich placers have again been discovered in Lower California. Mr. Pico says that the placers pay \$70 a day to the hand, and if there is room and water for work, of which the News did not learn, it is a big opening for the people of Lower California, and, no doubt, they will improve it. The placers are near San Diego, say about 50 miles out, and 25 miles from the rancho Nejo, below Los Juntas. It is highly probable that if the placers are half as rich as reported, there isn't any water to work with or there is some equally disappointing drawback. We have not much faith in Lower California mines, and have yet to find some who have made money there mining.

THE September hullion product of the Leeds mine is \$33,370, a gain over the previous month. The dividend is assured, and may be increased.

## PATENTS AND INVENTIONS.

## List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING OCTOBER 20, 1877.

EAG BEATER.—Thomas Borchert, S. F.  
DISH WASHER.—Samuel S. Watson and John J. Scott, S. F.  
AERIAL MACHINE.—John B. Ward, S. F.

The patents are not ready for delivery by the Patent Office until some 15 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

THE MARIPOSA SUIT.—A dispatch from New York says: The real facts of the pending suit between Eugene Kelly and the Mariposa mining company are briefly these: Kelly proceeded to foreclose a mortgage held by him on the Mariposa mining property. T. O. Wallace, a heavy stockholder, claiming for himself and others that the mortgage was fraudulent, and that all just claims against the company have been paid, brought suit here against Kelly & Co., to compel them to surrender said mortgage upon above stated grounds, and also to recover \$300,000 claimed to be due to the company by defendants and \$1,000,000 damages which the company and stockholders claim to have suffered through illegal acts of the defendants. Judge Dykman, on motion of ex-Judge Fullerton for the plaintiff, granted a temporary injunction restraining Kelly & Co. from continuing their foreclosure suit in California and interfering with the estate or the possession thereof of the Mariposa land and mining company, by its officers. The argument upon the question of making the injunction permanent was yesterday postponed to Monday next, at the request of Kelly's attorney.

VICTORY FOR THE RAILROAD.—In the suit of the United States against the Central Pacific Railroad Company, to recover five per cent. on the net earnings of the company from July, 1869, to October, 1874, amounting to \$1,836,635 10, Judge Sawyer has rendered a decision in favor of the defendant, on the ground that the construction of the railroad had not in its completeness reached the standard at which, according to the law, percentage was chargeable. In the opinion of the court the Central Pacific Railroad Company did not become liable to apply five per cent. of the net earnings of the Central Pacific railroad annually to the payment of the subsidy bonds and interest in pursuance of the acts of Congress authorizing the construction of the said road, till October 1st, 1874, the date of the completion of the road.

THE PACIFIC BUSINESS COLLEGE.—This institution is now so well known on this coast that it is scarcely necessary to direct the attention of the public to the advantages offered by it. The facilities offered for a practical business education are unexcelled. Young men who have been trained at this college now occupy responsible positions in all the departments of business. A first-class business education is imparted together with a practical knowledge of telegraphy, and a thorough instruction in English and mathematical branches, penmanship and modern languages. The courses of study in all branches are eminently practical.

## New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

COMMONWEALTH CON. Co.—Oct. 16th. Location: Elko county, Nevada. Capital stock, \$10,000,000. Directors—Walter M. Rockwell, Thomas Walling, Charles A. Morse, Stephen H. Phillips and Pelham W. Ames.  
UNITED STATES PETROLEUM Co.—Oct. 16th. Location: Ventura county, California. Capital stock, \$800,000. Directors—Chas. E. Convis, Edwin W. Crook, O. H. Brooks, Thos. E. Atkinson and W. B. Murdock.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from prominent mines have been as follows: Northern Belle, Oct. 7th, \$13,147.06; California, 10th, \$113,899.47; Con. Virginia, 10th, \$241,384.35; Northern Belle, 9th, \$4,837.35; Arizona, 10th, \$541.70; Grand Prize, 12th, \$14,700; California, 13th, \$252,757.03; Con. Virginia, 13th, \$80,880.08; Manhattan, 9th, \$12,400; Raymond & Ely, 10th, \$15,000; Northern Belle, 11th, \$5,164.78; Arizona, 13th, \$1,276.42; Modoc, 12th, \$6,327.13; Coso Cou., 10th and 12th, \$3,550.19; Indian Queen, 8th, \$4,845.38; Manhattan, 11th, \$12,106.60.

INCOMPARABLY beautiful are Morse's retouched and colored photographs, and glaze pictures, and we are astonished that so plain a face can be made to look so well as many that we saw there, and yet retain the expression and features of the sitter. The retoucher's art softens the asperities of a rugged countenance, until we see it in its sunshine, where we were wont to look for shadow. This is the true artist's work, and nowhere is done to greater perfection than at Morse's, No. 417 Montgomery street.

## OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy agents.

J. L. THARP—San Francisco.  
B. W. CROWELL—California.  
A. C. KNOX—Pacific Coast.  
C. N. WEST—Santa Cruz, Monterey and San Benito counties.  
A. C. CHAMPTION—Tulare, Fresno and Inyo counties.  
JOSEPH DUMBLE—Mendocino, Humboldt and Del Norte counties and Oregon.  
W. D. WHITE—San Bernardino and Los Angeles counties.  
J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.  
B. E. LLOYD—Alameda, Contra Costa and Napa counties.  
E. M. DENNY, Oregon.  
F. B. ALDERSON, Nevada.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us against the acts and mistakes of others.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

"SPEAKS WELL," ETC.—We would return thanks for an exchange and back numbers of the MINING AND SCIENTIFIC PRESS, published by DEWEY & CO., of San Francisco, Cal. It is a well edited, interesting, and valuable journal and speaks well for our Pacific neighbors.—U. S. Milling and Manufacturing Journal.

## To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

## PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where he principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this act at short notice.

DEWEY & CO., Publishers.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

**Excelsior Silver Mining Company**—Location of principal place of business, San Francisco, Cal. Location of works, Potosi District, Lincoln County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of an assessment levied on the fourth day of September, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificates.	No. Shares.	Am't.
Antonovich, F.....	234	100	\$10 00
Barsi, M.....	232	50	5 00
Bini, L.....	232	50	5 00
Egan, John.....	232	100	10 00
Russo, S.....	233	25	2 50
Simi, M.....	233	50	5 00
Vidak, L.....	236	100	10 00

And in accordance with law, and an order of the Board of Directors, made on the tenth day of October, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, on Tuesday, the twenty-third day of October, 1877, to pay the delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office, 312 Post Street, San Francisco, Cal.

**Fresno Quicksilver Mining Company.**

Location of principal place of business, San Francisco, Cal.

Location of works, Mexico, Fresno County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the nineteenth day of September, A. D. 1877, an assessment, No. 5, of two cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 414 California street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the twenty-third day of October, 1877, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the third day of November, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office, 414 California street, San Francisco, Cal.

**Mariposa Land & Mining Company** of

California.—Location of principal place of business, San Francisco, California. Location of works, Mariposa County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the twelfth day of September, 1877, an assessment, No. 12, of \$1.00 per share was levied upon the capital stock of the corporation, payable immediately in U. S. currency to the Secretary at the office of the company, room 33, Nevada Block, No. 309 Montgomery street, San Francisco, California, or to the Assistant Secretary, at the office, No. 9 Nassau street, New York, N. Y.

Any stock upon which this assessment shall remain unpaid on the fifteenth day of October, 1877, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twelfth day of November, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, LEANDER LEAVITT, Secretary.

Office, Room 33, Nevada Block, No. 309 Montgomery street, San Francisco, Cal.

POSTPONEMENT.—At a meeting of the Board of Directors of the Mariposa Land and Mining Company of California, held October twelfth, 1877, the delinquent day for stock on the above assessment was postponed until October twenty-ninth, 1877, and the sale day for such delinquent stock was postponed until Monday, November twenty-sixth, 1877.

LEANDER LEAVITT, Sec'y.

**Merced Mining and Water Company.**

Principal place of business, San Francisco, Cal. Location of works, Merced Co., Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the second day of October, 1877, an assessment (No. 1) of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, at No. 226 Pine Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the twentieth day of November, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the tenth day of December, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, F. T. HOUGHTON, Sec'y.

Office, 326 Pine Street, San Francisco.

## SCRIBNER'S LUMBER and LOG-BOOK.

OVER HALF A MILLION SOLD.

Most complete book of its kind ever published. Gives correct measurement of all kinds of lumber, logs and plank by Doyle's rule, cubic contents of square and round timber, stave and heading bolt tables, wages, rent, board, capacity of cisterns, cord-wood tables, interest, etc. Standard book throughout United States and Canada. Ask your bookseller for it, or I will send one for 35 cents, post-paid. G. W. FISHER, P. O. Box 233, Rochester, N. Y.

SOLD ON THE PACIFIC COAST BY

DEWEY & CO., San Francisco,

And mailed post-paid on receipt of 35 cents in currency or postage stamps.

## STEEL CASTINGS,

Solid and Homogeneous. An invaluable substitute for expensive forgings, or for Cast Iron requiring great strength. Send for circular and price-list to

CHESTER STEEL CASTINGS CO.,

EVELINA STREET, . . . PHILADELPHIA, PA

## Iron and Machine Works.

**PACIFIC ROLLING MILL CO.,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON  
—AND—

Every Variety of Shafting,  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Pleton and Con-  
necting Rods, Car and Locomotive  
Axles and Frames,  
—also—

Hammered Iron of Every Description and Size.

Orders addressed to PACIFIC ROLLING MILL  
COMPANY, P. O. Box 2032, San Francisco, Cal., will re-  
ceive prompt attention. OFFICE: 16 First Street.  
The highest price paid for Scrap Iron.

THOS. PENDERGAST.

HENRY S. SMITH

## ÆTNA IRON WORKS,

MANUFACTURERS OF

## IRON CASTINGS

## and MACHINERY

OF ALL KINDS.

mont Street, Bet. Howard and Folsom

SAN FRANCISCO.

## SHEET IRON PIPE.

## Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM  
PIPE, of any size and for any pressure, and contract to  
lay the same where wanted, guaranteeing a perfect work-  
ing pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special  
patterns for Mining Cars. These small wheels are made of  
the best Car Wheel Iron, properly chilled, and can be  
fitted up with the improved axle and box—introduced by  
this company, and guaranteed to outlast any other wheels  
made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

## PHELPS MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle  
Work, Car Frames and Bolts, Machine  
Bolts, Set Screws and Tap Bolts,  
Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.  
HOT AND COLD PRESSED HEXAGONAL AND  
SQUARE NUTS, WASHERS, BOLT ENDS,  
TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

## SACRAMENTO BOILER WORKS,

87 Fremont St., cor. Mission, S. F.

## HALL & KELSHAW,

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks,  
Hydraulic Pipe, Oil or Water Tanks, Ore and  
Water Buckets, Gasometers, Girders, Bridges  
and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.  
Repairing promptly attended to at the  
lowest possible terms.

## GOLDEN STATE & MINERS' IRON WORKS.

Manufacture Iron Castings and Machinery  
of all kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

## CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minna,  
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt  
Metal Castings, Brass Ship Work of all kinds, Spikes,  
Sheathing Nails, Rudder Braces, Hinges, Ship and Steam-  
boat Bells and Gongs of superior tone. All kinds of Cocks  
and Valves, Hydraulic Pipes and Nozzles, and Hose Cou-  
plings and Connections of all sizes and patterns, furnished  
with dispatch.  
J. H. WEED. PRICES MODERATE. V. KINGWELL.

## California Machine Works,

119 BEALE STREET, SAN FRANCISCO.

## BIRCH, ARGALL & CO.,

Buildings of QUARTZ, SAW AND FLOUR MILLS;

Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORES,  
And General Machinists.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

## IMPROVED PORTABLE

## Hoisting Engines,

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

RANKIN, BRAYTON & CO.,

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY  
INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS,  
CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES,  
FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES,  
RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES,  
SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE  
LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster  
Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

## UNION IRON WORKS,

SACRAMENTO CAL.

ROOT, NEILSON & CO.,

MANUFACTURERS OF

## STEAM ENGINES, BOILERS AND ALL

Kinds of Machinery for Mining Purposes.

Flouring Mills, Saw Mills and Quartz Mills Machinery  
constructed, fitted up and repaired.

Front Street, Between N and O Streets,

SACRAMENTO, CAL.

## THOMPSON BROTHERS, EUREKA FOUNDRY,

Light and Heavy Castings of Every De-  
scription Manufactured.

Sole Proprietors and Manufacturers of

Lynch's Ventilating and Illuminating Tile,  
The Only Illuminating Tile Manufactured for Light-  
ing Cellars, Basements and Dark Rooms which pro-  
vides proper ventilation for such places

129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

## STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz  
Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron  
Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

## McAFEE, SPIERS & CO.,

## BOILER MAKERS AND

GENERAL MACHINISTS,

Howard between Fremont and Beale Sts., San Francisco.

## Metallurgy and Ores.

## JOHN TAYLOR & CO.,

Importers of and Dealers in

## ASSAYERS' MATERIALS.

CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.

512 & 518 Washington St., San Francisco.

We would call the special attention of Assayers, Chem-  
ists, Mining Companies, Milling Companies, Prospectors,  
etc., to our stock of Clay Crucibles, Muffles, Dry Cups,  
etc., manufactured by the Patent Plumbago Crucible  
Co. of London, England, for which we have  
been made Sole Agents for the Pacific Coast. Circulars  
with prices will be sent upon application.  
Also, to our large and well adapted stock of

## Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast.

Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application.

JOHN TAYLOR & CO.

## THOS. PRICE'S

## Assay Office and Chemical Laboratory,

524 Sacramento St., S. F.

Deposits of bullion received, melted into bars, and re-  
turns made in from 24 to 48 hours.

Bullion can be forwarded to this Office from any part of  
the interior by Express, and returns made in the same  
manner.

Careful Analysis made of Ores, Metals, Soils, Waters,  
Industrial Products, Etc. Mines examined and reported  
upon. Consultations on Chemical and Metallurgical  
questions.

## Nevada Metallurgical Works,

No. 23 STEVENSON STREET.

Near First and Market Streets.

Ores worked by any process.

Ores sampled.

ASSAYING in all its branches.

Analysis of Ores, Minerals, Waters, etc.

WORKING TESTS MADE.

Plans furnished for the most suitable process  
for working Ores.

Special attention paid to Examinations of  
Mines; plans and reports furnished.

E. HUHN,

C. A. LUCKHARDT,

Mining Engineers and Metallurgists

Will receive a few pupils at his new laboratory, No. 61  
Montgomery Street, up-stairs. TERMS MODERATE.

## STRONG & CO.,

Assayers and Metallurgists,

10 STEVENSON STREET, S. F.

## Buy the Best.

Before purchasing an American  
Watch, examine the different styles  
manufactured by the HAMPDEN  
WATCH COMPANY, at Springfield,  
Mass. They are the latest and  
best improved manufacture. You  
can depend upon them for fine finish,  
durability and perfect time. They  
are sold at favorable prices—in  
fact, no higher than many of the  
inferior styles. Examine into the  
merits of this Watch before you  
buy any other. Our word for it,  
you will not regret it.

DEWEY & JORDAN, Agents,

433 Montgomery St., S. F.

To Ship and Engine Builders, Steam  
ship Companies, Etc.

A Mechanical Engineer, having an extensive experience  
in Marine Engineering (especially compound) and Iron  
Ship Building, also in Steam Engines and Machinery in  
general, is open for engagement. First-class references.  
Address and references can be obtained at office of Sci-  
entific Press.

## Machinery.

## The Ingersoll Rock Drill

Is Extensively Used in the East and

## TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less  
power, labor and repairs, and do more work than any  
other Drill in the market. It has but few parts, is easily  
handled, being light, and has AUTOMATIC FEED, which  
saves labor. WE ASK FOR TRIAL AGAINST ANY  
COMPETITOR. For particular information regarding  
Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

320 Sansome Street,

(Room 10,)

## THE O'HARRA

## CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
Wood—23 Cords at \$3 per cord.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00

Cost of 20 tons.....	\$52 25
Cost of one ton.....	2 61

In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Eschschuer mill, Alpine Co., Cal. For further in-  
formation, apply to

D. J. O'HARRA,

Reno, Nevada.

## BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER

J. C. Sanderling, Sole Ag't Pacific Coast

51 Fremont Street, S. F.

## TIRRILL'S UNDERGROUND METRE.

## GAS MACHINES

If you are examining Gas Machines it will be a great  
mistake not to send for the circular of the simplest and  
most effective Gas Machine ever invented.

METRE GAS MACHINE, 39 Dey St., N. Y.

## HUNT, DOUGLAS & STEWART Process,

Used in Connection With PURVINE

## Wooden Amalgamating Pans and Settler.

This is a complete, perfect and economical adaptation  
of the humid method to the treatment of Gold or Silver  
ores, associated with

## COPPER

And other base metals, or to ores free from base metals.  
It can be adapted to any first-class Gold or Silver mill, at  
a reasonable additional expense.

For further information, address

J. O. STEWART,

Georgetown, Colorado.

A 16 Candle Light for One Thousand Hours  
at a Cost of 30 Cents.

## WREN'S PETROLEUM GAS WORKS

Are now doing this in Towns, Cities, Mills, Hotels, etc.,  
where in use. The same amount of light from coal gas,  
at \$3 per 1,000 feet, will cost \$15.

Send for references.

DEALERS IN

H. W. JOHNS' ASBESTOS ROOFING AND PAINTS—Fire and Weather Proof

ASBESTOS STEAM PACKING, made from pure long fiber Asbestos. Indestructible and Self-Lubricating. Circulars and Descriptive Pamphlets Sent Free.

We have the best Imitation Gold Watch in the Market for Trading Purposes. The metal is a composition of other metals, so closely resembling gold that the best judges and it difficult to detect the difference, except by a chemical test, and it has the virtues requisite to make it the best substitute for gold money. GENUINE AMERICAN MOVEMENT. EXPANSION BALANCE. BEAUTIFULLY ENGRAVED OR ENAMELED TRIMMED HUNTING CASES, and equal in appearance to a GOLD WATCH THAT COSTS FROM \$150 TO \$200. It sells and trades readily; for from \$20 to \$30, and if you wish a watch for your own use or to make money on, try this. Owing to our large sales, we are enabled to reduce the price of them to \$12 each with an elegant Chain attached. They are used on Railroads, Steamers, and in Manufactories, and other places where accurate time is required, and gives general satisfaction. We send them by Mail or Express, on receipt of \$12, to any part of the Country, or it will be sent C.O.D. when the customer desires and remits \$2 in account. These Elegant CHAINS weigh about five Pennyweights, and the same pattern in pure gold would cost \$100. We sell these Chains at \$5 each. But we sell the Watch and Chain for \$12, sent by Mail in a Registered Package, post-paid, in any Post Office in the United States.

WE SELL THE WATCH WITHOUT THE CHAIN FOR \$10.

## CAUTION TO HYDRAULIC MINERS.

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 16th of May, 1876, and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

**BUTCHERS' TOOLS.**

NO. 2, HAND, DRAW-CUT SAUSAGE CHOPPER.

PRICE, \$90.

Will chop 40 pounds of beef or pork in 12 minutes, as well as the best butcher can cut it with a rocker. It has 39 inches of knives, and its block is 23 inches across.

NO. 5, SMALL HAND—PRICE, \$60.

Is like No. 2, but smaller; will cut 18 pounds in 12 minutes. It has 26 inches of knives, and its block is 20 inches across.

NO. 8, POWER, DRAW-CUT SAUSAGE CHOPPER, PRICE, \$250.

It will cut 80 pounds of meat in eight minutes, and requires only one horse power to run it. It has six knives, each 16 1/2 inches long. Its block is 38 inches across. It will cut more meat with less power than any other chopper in the world.

**PACIFIC BUSINESS COLLEGE,** 320 POST STREET, Opposite Union Square, San Francisco.

This institution imparts a first-class Commercial Education, a practical knowledge of Telegraphy, and thorough instruction in the English and Mathematical branches, Penmanship and the Modern Languages. It has ever been a cardinal principle in the management of the College to provide thorough and practical courses of study. Every available modern improvement has been introduced, and whatever energy and liberal expenditure of money could do, has been done to place the institution at the head of similar schools.

**LIFE SCHOLARSHIPS**

For a complete Business Course are issued at the low rate of \$70. This is the only Business College in the State that employs this liberal system of tuition fees. Day and evening sessions during the entire year. Ladies are admitted into all the departments. Each student receives separate instruction. The discipline at the school is excellent. Graduates at the Pacific Business College find little difficulty in obtaining good situations, being preferred by our business men to the graduates of any similar institution. Those who desire to prepare themselves for the practical duties of life, at the least expense of time and money, should examine the merits of this school before attending elsewhere. Patent Solicitors.

SAN FRANCISCO, SATURDAY, OCTOBER 27, 1877.

VOLUME XXXV.  
Number 17.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

**IMPROVEMENT IN SAW MILL SET WORKS.**—J. A. Robb, S. F. The principal object of this invention is to combine a hinged supplemental stop attachment with the quadrant beside which the set lever of a saw mill set-works operates, so that it can be used to shorten the throw of the lever when it is desired to take out the width of the saw kerf in sawing planks of more than the usual thickness. The stops usually employed for limiting the movement of the set lever are permanently adjusted to a certain thickness of board, so that each throw of lever will move the head blocks a specified and uniform distance. If, however, it be desired to saw a board of double thickness and the lever is given two throws or motions, each throw stopping at the permanent stop, it is evident that the board will have an excess of thickness equal to the width of the kerf, which the saw would have renewed if it had been run through the log after the first throw. Mr. Robb's supplemental stop is intended to obviate this difficulty by limiting each motion or throw of the lever after the first motion of the lever has been once made in the ordinary way, sufficiently to take out this excess of thickness. The invention also includes a weighted brake for preventing the momentum of the hand wheel from rotating the screw shaft beyond the point to where it is carried by the lever. Also an improvement in the screw rods which move the head blocks.

**PRESERVING PILES AND LUMBER.**—John P. Culver, S. F. This invention is a means of preserving timber and piles, more especially against the ravages of the teredo and other destructive marine insects. It consists in wrapping or otherwise coating the timber to be preserved with burlaps or other suitable fibrous material, which has been saturated with asphaltum, coal-tar, petroleum, or other bituminous or preservative material, the fiber serving as a bond to retain the preservative in place. It has been noticed that as long as the bark remains on a pile it will not usually be attacked by the teredo, but the action of the water, chafing by vessels, etc., serves to abrade the pile sooner or later, after which it is immediately attacked. The invention and process is not only to preserve the pile by the quality of the material employed but it also serves as a wrapping which will prevent the bark from being easily rubbed off, so that in the case of any timber with the bark on, it acts as a double preventive.

**COIN WRAPPERS.**—Rodger L. Ryan, S. F. For convenience in handling silver coin it is usually made up in rolls in specific amounts, and when a large amount of money is paid in silver these rolls pass current for the supposed amount contained, as it would be a severe task to unroll and count the coins in each package. Unscrupulous persons take advantage of this fact and sometimes insert counterfeit coins or make the package short or introduce pieces of base metal of equal weight. To obviate this the improved coin wrapper is made. This is so constructed that it exposes the edge of each coin in the roll and the entire face of the coin at each end. It is more convenient than those now in use.

**ROD COUPLING.**—Theodore D. Culter, Westminster, Los Angeles county. This invention relates to an improved coupling for connecting such rods as are used in boring artesian wells, and are also to be used for connecting other tubes and rods where great strength is required, and rapidity in connecting and disconnecting the pipes or tubes is required.

**COPPER IN LIVERPOOL.**—The price of copper has fallen still lower in Liverpool. Quotations for ore on the first inst., according to James Lewis & Son's report on ores and metals, were 12s. to 12s. 6d per unit. Chile exports for this year up to Sept. 15th have been 34,813 tons fine, as against 40,685 tons at the same time last year.

## The Rains.

The dust lies motionless at the command of the clouds. The air is washed of its smoke and haze by the drops which have quite freely fallen. From north to south and across the breadth of the State, the downfall was enough to darken the ground hues and so change the view which meets the eye and the air which falls upon the cheek, that all have surely that the season for moisture and for growth has come.

As our rains this year have made a record of commencement in October, it is of interest to note that the same starting point in former years has given a fair sequence in the majority of instances. For the last seven years the time of beginning and the final result may be noted thus:

Year.	Month.	Inches for the season
1871-72	October 27	30.66
1872-73	September 26th	17.52
1873-74	October 8	24.93
1874-75	October 9	20.56
1875-76	October 27	31.19
1876-77	October 10th	11.04

Thus it appears that, though a beginning in October brought us drouth last year the case was quite exceptional, and an inference adverse to October rains is contradicted by taking into

Fig. 1 LATHE READY FOR TURNING.

account a few preceding years. Although the final result is as above laid down, there are reasons why a beginning of rain in November is better than when coming earlier, but who knows that we shall not enjoy combined blessings this year?

The hydraulic miners will soon be busy again after a season of comparative quiet, during which they have been getting their claims in order. Soon, however, the ditches will be full again and the big streams will be washing the gravel down the flumes in a manner to make the miners rejoice.

**MINES ON AGRICULTURAL LANDS.**—A correspondent asks us whether, if he discovers a mine on agricultural land, he can patent said mine. The answer is that in case valuable deposits of mineral are discovered upon legal subdivisions of the public lands, after the same have been entered as agricultural, but before patent has issued therefor, the parties claiming the possessory right to said mine may make application for patent for it, and the agricultural entry will be canceled to that portion of the tract embraced by the mining claim. This is in brief a decision of the Commissioner of the General Land Office in March, 1873.

ONE day last week a man by the name of James McGee walked to one of the shafts of the Oneida mine, Amador county, and deliberately leaped headlong into it to a depth of 600 feet, causing, of course, almost instant death. He was a man of steady habits, but had poor health, and is supposed to have been mentally deranged at the time he committed the rash act. The deceased was a single man, a native of New York, and aged about 43 years.

## Locations and Expenditures on Veins.

There is no provision of law to prevent parties from locating other claims upon the same lode, outside of the first location made on the vein or lode. If a lode of 3,000 feet in length is discovered, two locations may be made, of 1,500 feet each; but the necessary expenditures and work required by the laws of the United States and the local regulations must be made on each separate claim. That is to say, \$100 worth of work a year will protect 1,500 feet from liability to relocation, but not the whole 3,000 feet, as that expenditure is required on each claim.

Miners must recollect, moreover, that before a patent can issue to a claim, \$500 must have been spent in labor or improvements. This \$500 expenditure must be shown upon the plat and filed notes of the classes of claims mentioned in the Mining Statutes. It may be as well to state also that the Commissioner of the General Land Office has decided that if a party applies for a patent to a relocated mine, it will be necessary for him to offer satisfactory proof that a sum not less than \$500 has been expended upon the mine by the applicant or his grantors. The fact that \$500 has been expended upon the

Fig. 2 JIG SAW READY FOR USE.

Fig. 3 CIRCULAR SAW IN POSITION.

claim by a person or persons who subsequently abandoned it, will not relieve the applicant from the necessity of showing that he or his grantors have expended thereon the amount required by law.

**THE WOODRUFF SCIENTIFIC EXPEDITION.**—The N. Y. World of Oct. 22d says: It is now definitely announced that the Woodruff scientific expedition around the world will not start before June 1st, 1878, as it has been found upon examination that the steamer in which the voyage was to have been made is unfitted for the purpose. The Directors, therefore, contracted with John Roach to build a new one, especially arranged for the expedition, to be ready by the 18th of May. This vessel is to be 325 feet long and 40 feet wide and will contain the latest and best improvements in machinery, and he one of the handsomest and strongest steamers afloat. The plan and route will remain substantially the same as heretofore published, except that the route will be almost reversed, going first to England and thence to France and to the great exposition at Paris, possibly to St. Petersburg, and on the return voyage visiting the Sandwich islands and San Francisco, and from there, probably to Peru, the Society islands and the Fiji islands, and thence home, via the Straits of Magellan, being absent two years. Details are now in course of preparation. The same educational plan and purpose will be maintained in every particular, with substantially the same management, officers and faculty.

The Baltimore Con. mining company has increased its capital stock from \$5,400,000 in 54,000 shares to \$8,400,000 with 84,000 shares.

## Hendy's Concentrators and Feeders.

Joshua Hendy shipped away last week seven of his "\$1,000 Challenge Ore Feeders," four of which went to the Plumas National mill, two to Amador county, and one to eastern Nevada. There are now over 250 of these machines running satisfactorily to the purchasers. Mr. Hendy has just made a contract to put in operation at a mill near Greenville, Plumas county, four of the Challenge feeders, and eight concentrators, subject to the approval of the company. The payments for these machines are to be made from the savings of the concentrators, less the cost of labor in attending to the same.

It is understood that as the concentrators save amalgam, or sulphurets, the total product shall become the property of Mr. Hendy, and credited to the amount of purchase of the machinery. In the event of failure to save any amalgam in paying quantities, he is to have the sulphurets, and the company are to furnish the power and a pan to work them, the net proceeds to be applied to paying for the machinery. All the expense of freight, setting the bed timbers, belts, shafts, pulleys and labor of placing the whole is to be paid by Mr. Hendy, and is included in the contract price. This is a somewhat unusual contract, but shows Mr. Hendy's faith in his concentrator, and also in the mine. On the other hand the company pay a double price for the machinery, which has to earn the money itself. The mill is in the neighborhood of the Green Mountain and Gold Stripe mining companies' property.

## The Combination Lathe.

The illustrations on this page represent the "combination lathe," for the use of amateurs and mechanics who desire to economize both in cost of, as well as in space occupied by, their tools. It is a simple foot lathe, with which are combined both a jig and circular saw all mounted on the same bed, both swinging back out of the way when not in use. Fig. 1 shows the lathe ready for turning, with the jig and circular saws thrown back. Fig. 2 represents the jig saw in position for use; and Fig. 3 the circular saw in position for use. This tool can be seen at Dunham & Carrigans, 107 Front street, where are also other styles of lathes, both large and small. The combination tool a good one for a Christmas present, being both useful for amateurs and mechanics.

**HYDRAULIC MINING.**—The article on this subject from the pen of the well-known engineer, Aug. J. Bowie, Jr., which is now being published in the Press, is an especially valuable one, and our hydraulic mining friends will find it worthy of preservation. It was read before the American Institute of Mining Engineers, as one of their papers, and will only appear in their transactions and not be published for sale. There is, therefore, no other way of obtaining the article except by keeping the files of the Press. The facts and figures given are of great value as showing the results of practical work. A reliable article of this kind is more profitable for miners to read and study than any other class of literature. We advise those who do not usually file away the Press to commence keeping their numbers now and they will have this standard article as a whole. It has been carefully revised and corrected by Mr. Bowie and comprises the whole literature of hydraulic mining in California.

**LINING OF THE BOWMAN DAM.**—All the water of the Bowman reservoir of the North Bloomfield gravel mining company having been drawn off this season, the lower water face of the dam is now, for the first time in eight years, exposed to view. The lining, formed of three-inch pitch pine planking, firmly spiked to supports 18½ inches apart, has maintained a pressure of 67 feet (nearly 30 pounds to the square inch) and is found to be in perfect order without a sign of giving to the great pressure.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### Shall the Salmon be Exterminated?

EDITORS PRESS:—It gave me much pleasure to see the letter of Mr. T. T. Williams in your paper of the 6th instant. If we can get intelligent fishermen like Mr. Williams to discuss the question of fish culture, and to admit the necessity for any law for the preservation of fish in our waters or to concede that it is necessary that some fish be allowed to reach their spawning grounds—that the species may be preserved—it will not be long before this subject will be fully understood. A full discussion will show the fishermen that their true interests, looking to the future, is in an honest observance of proper laws, made with the sole purpose of continuing and increasing the supply of fish in our rivers, so that those who come after us shall find them as abundant as we found them.

I desire to correct some errors into which Mr. Williams has fallen; and one is as to there being two different varieties of salmon in the Sacramento river. Mr. Williams is mistaken as to the fact when he calls the hooked-mouthed or black salmon, a different variety from the salmon that has not the hooked mouth. The habits of salmon in fresh water have been thoroughly studied by scientific men, learned in ichthyology, and both of these fish are identical as to the species and variety. The salmon when it first comes in from the ocean, is bright and silvery. After it reaches fresh water it ceases to eat, and as it continues in fresh water its scales are absorbed and its skin turns black; it becomes hook-mouthed, and dogs' teeth or tusks are developed. As Mr. Williams says, they are never seen in the river until August, for it takes a month or two after they reach fresh water for these changes to become developed. These changes are further developed as they ascend to the head of the stream for the purpose of reproduction, and probably a salmon taken from there would be called a third variety, and, in fact, is occasionally called the dog-toothed salmon. But all these fish are identical, all one species and variety of salmon, which have undergone changes connected with their removal from salt to fresh water, and also connected with the alterations in their system consequent upon the reproductive instinct.

Mr. Williams and the 50 salmon fishermen whom he represents, would commit a grievous error in fixing upon the month of July as being the only proper month for the close season.

In this I fear he and his friends look only to their temporary interests and immediate profits and not to the perpetuation of the business and the interests of the public.

A Committee of the Legislature obtained the evidence of very many of the most intelligent fishermen on the river, as to what particular season the largest quantities of fish were ripe, and when, looking to the interests of the fishermen and the public, would be the best time in which to permit a portion of the ripe fish to reach their spawning grounds. This they decided to be from August 1st to November 1st. The concurrent testimony of these fishermen was that there were two runs of salmon in the Sacramento; the spring run, which commenced in November and ended in July—having its greatest strength in May; and the fall run, which commences the first of August and ends about the 15th of October. It will be seen that the fishermen have all the spring run without restriction, and one-half the fall run, the law intending that the other half of the fall run should be allowed to reach their spawning grounds; therefore, if July should be selected as the only month in the year for a proper close season, as Mr. Williams suggests, it would be a month taken between the spring and fall runs, when there are scarcely any fish in the river to spawn. This would not be just to the public interest, and its effect would be to exhaust the river of fish in a very few years.

A fisherman of more than 20 years on the Sacramento, and who really desires to see the supply of fish kept up, in writing to me on this subject says: "I am glad that your Commission assumes an aggressive attitude, looking to the execution of the law for the protection of salmon. I must admit there is no reasonable doubt that in the absence of such an action, the ever increased demand for fish as a staple in commerce, would have resulted in the extermination of the species in these waters. The catchers and cannerymen would have realized the fabulous story of the party who killed the goose that laid the golden egg. The close season should on no possible line of pretense or persuasion be pressed outside of the months of August and September to give opportunity for fishing in those months. Right there is the life of the matter. The regularity, the multitudes and urgency of the seed run, the consequent ease and certainty of the catch, the fine weather for work, all present a weighty temptation to catcher and cannery. Look out for the grand assault on these two months in the Legislature this winter. If they press you hard this winter you should fight for the last half of August, in

some connection, as the Jews fought for their temple."

These are the opinions of a fisherman who follows the business and catches fish for the canneries and the market of San Francisco. There can be no question about the facts. It hardly requires argument and it seems to me it is hardly open to discussion. The great body of fish come into the river to spawn in August and September. Shall a portion of them be permitted to reach their spawning grounds to deposit their eggs? If so, the fish should not be caught during this period, and this constitutes what should be the close season.

If Mr. Williams and his 50 friends will reflect that something should be done toward keeping up the supply of fish, and that to do this it is necessary that some ripe fish of the fall run should have an opportunity to go to their spawning grounds, I think, will concede that out of the whole 12 months the fish should have August and September, and not July, when the few fish in the river are made up of part of the spring run and the beginning of the fall run.

I am very glad to know that so many fishermen are willing to discuss these questions, as I am satisfied if they will give their views we shall soon get at all the facts, and they themselves will, in the end, be convinced that the Legislature and the Commissioners are not their enemies, but desire to continue and increase the fish in the rivers for their benefit, and also for the benefit of the public. B. B. REDDING.  
San Francisco, October 11th, 1877.

### Plumas County Mines.

EDITORS PRESS:—I wish to give you some notes on the mines of this county, that have come under my actual observation, in the vicinity of Greenville, during my brief stay here. The Gold Stripe mine, on Wolf creek, was discovered some years ago by an old resident of Indian valley, Mr. John Lowrey, but he being at the time unable to work it and there being but little interest taken in the mines then, he failed in getting capitalists interested; not keeping his location good, it was subsequently relocated by A. McIntyre. The mine has paid from the "word go," and the company, of which E. Green, of Oakland, is a member, are pounding away on pay ore night and day, with a 24-stamp mill. The ledge is from 2½ to 40 feet thick, and widening as it goes down. The ore of this mine—as well as all the mines in the district—is of low grade, but yet is worked with a profit on account of the superior advantages of working the mine and milling the ore. The ledge is easily worked with pick and shovel. I have not heard a blast since I have been in the district. Timber is very abundant. Water facilities are excellent, and ore can be worked at a profit of as low a grade as \$4 per ton. The very fact that the ore is not base and easily worked, and that low-grade ore can be successfully worked, is proof of the permanency and future prosperity of the camp.

The company intend to put up a new mill in the spring, as soon as the tunnel, which they are now running on a level 160 feet below the present tunnel, reaches the ledge. They are in on this tunnel 550 feet, and will strike the ledge about 380 feet below the surface, at a distance of 900 feet, which event they expect to celebrate next May.

#### The Wisconsin Mine.

This mine is situated about one-quarter of a mile from the Gold Stripe. The principal owners are C. H. Lawrence, H. J. Hathaway, John Taylor and Ed. Shattuck. The company have run a tunnel some 200 feet long, and are taking out pay rock, principally decomposed quartz. The ore vein varies in width; it is 15 to 20 feet wide. The foot wall is serpentine, and hanging wall slate. Mr. Shattuck assured me that the cost of mining and milling this ore did not exceed \$2 per ton. The company have a 10-stamp mill, and a frame large enough to admit five more stamps. Sufficient water runs from the tunnel for milling purposes. The prospects of this mine are very encouraging. The mill has only been running two or three weeks. What the average yield of the ore per ton is I did not learn, but have since heard that it was about \$15.

#### At the New York Mine,

One mile south of Greenville, the company are still at work taking out ore that is paying well. A 10-stamp mill run by water power is in constant motion; capacity, 15 to 18 tons per day. The ore heretofore has been averaging about \$8. It is now averaging about \$12. The superior advantages of working the mine and milling the ore renders its actual expense only about \$2.50 per ton; the mill started last April. The ledge averages about three feet wide, the ore being of a grayish color. The vein or pay chnte is about 240 feet in length, and has been prospecting to a depth of 300 feet. They are now milling ore from the 300-foot level. Another tunnel has been commenced 250 feet below the one from which the ore is now taken, which will strike the ledge at about 550 feet in depth. The tunnel will be about 800 feet long. The company expect to reach the ledge about May, 1878. The company consists of J. H. Whitlock, member-elect to the Assembly from Plumas and Lassen counties, and Thos. Lreaven, who are

the owners and personally work and superintend the mine. It pays \$100 net, daily.

#### Soda Creek District.

The Monitor and Jefferson mines, located last April, are owned principally by G. M. Compton, Frank Williams and Walter Stanley. The mines are being worked by the company, who are taking out ore and milling it at the old Kettle mill, at Round valley, about five miles from the mine and two and a half miles from Greenville. The Monitor is opened 600 feet on the surface, showing a well-defined ledge the entire distance. A tunnel is being prosecuted, and is now down on the ledge on a slight incline about 300 feet. The company have been at work since the discovery was made constructing a graded road about five miles long to a mill which they have leased to work the ore. From several assays made from different portions of the ledge, it ran from \$280 to \$500 per ton. The company are sanguine that they have the best mine in the district, and from the way they are handling it will undoubtedly realize handsomely from it. The vein lies nearly flat, and averages from five to seven feet in thickness.

The Arctic and South Arctic are located parallel with the Monitor and Jefferson. A tunnel is run on the Arctic 90 feet, and on the South Arctic 250 feet, and shows good ore. The company expect to build a large mill close to the mine in the spring.

#### Plumas National.

This was formerly the Washington mine, and is situated on Soda creek, about half of a mile below the Monitor. This company are working about 30 men. The ledge is about three and a half feet wide on an average, and is different from anything I saw in the district. The ledge is solid quartz, principally white, and shows rich in free gold. The principal owners are C. H. Lawrence, Chas. Reed and Joseph Hall. Their new 20-stamp mill started up on the 3d inst., and ran through 35 tons of ore, making a clean-up of \$459. They have a tunnel run in 300 feet on the ledge, which shows well, and it improves as they go in. The ledge dips at an angle of about 40°. The people all express unbounded faith in the mines in Soda Creek district.

I had not time to visit the Green Mountain mine, but am informed that it is being worked as steady as a clock and yielding well.

Indian Valley is worked at a depth of 800 feet, and shows a good fissure vein at that depth.

#### Greenville.

This town is situated at the foot of the mountains below the mines, in the upper part of the lovely Indian valley, and is one of the liveliest camps on the Pacific coast. It has grown up with wonderful rapidity since the discovery of the Soda creek mines, which promise to be very productive. I observed no less than 30 new buildings going up—many of them two-story houses, and some very fine ones. Greenville can boast of the largest hotel of any town of its size on the coast, it being about 120 feet square and can accommodate 150 guests. The building is two and a half stories high, hard finish, high ceilings and pleasant rooms. It is doing a "slashing" business, full and running over all the time. The dining room is roomy and can seat about 100 at a time. There is also a fine saloon, barber shop, hot and cold water baths, etc. The town is constantly increasing in population, many kinds of business being well represented. Of the several mercantile establishments, the largest is that of McBeth & Compton. A. Thom has a machine shop and foundry, employing about 15 men; he makes all kinds of castings. His furnace has the capacity to heat six tons at a time. They have on hand orders enough to last them nearly all winter. A sash and blind factory is adjacent to the foundry. McBeth & Compton are erecting a large two-story fire proof warehouse. The upper story is intended for a hall. Among other buildings is a large three-story flouring mill. The second story is used for an Odd Fellows' hall. There are several saw mills in the vicinity, run by both water and steam. The town is regularly laid out, and real-estate owners are clearing off their land, preparing for the spring demand, and in my judgment will not be disappointed in their expectation of opportunities to sell. There will unquestionably be a general move in the direction of Greenville next summer, and it is only surprising that the rich mines of Plumas county have remained undeveloped so long.

#### How to Get There.

For the benefit of parties going to the new gold diggings, or that may go in the future, I would say that it is easily accomplished over the graded road of Dennis H. Chapman, who runs a line of stages from Reno to Greenville, leaving Reno Mondays and Thursdays at 6 o'clock, A. M., and often when occasion requires. The fare is very reasonable, only \$11 for a distance of 93 miles, a considerable of the way over a heavy though good grade. The accommodations on the road are good. The stage stops at hotels over night, which gives the traveler abundant opportunity to rest. The scenery from Beckwith's to Greenville is delightful. We enter the immense forests of pine, fir and cedar a few miles from Beckwith's, which is a pleasant change from the dry and dusty sagebrush plains and sandy deserts. As we raise the grade, to our right may be seen high, towering rocks and peaks of mountain tops, which resemble in appearance many of the noted scenes of the famous Yosemite valley. A few miles from Bagley's we strike mountains of iron, which present a peculiar appearance. From the action of the wind, rain, cloud-bursts, etc., there are formed

numerous towering peaks. These high towers are honey-combed by the action of the elements, and the cells afford homes for the vultures. A few miles farther up, at the top of the grade, at a point called Cape Horn, where the sleighs of winter are exchanged for coaches, we get a panorama of the valleys and mountains. I shall not attempt a description of the scene. It is magnificent, and it is worth the pains of the lovers of scenery to visit this picturesque spot. Here we commence the descent of the mountain, following the windings of Indian creek, filled with speckled trout and other fish. In the mountains around us are found the bear, deer, grouse, quail, etc., which afford sport for those who delight in hunting. Early in the afternoon of the second day we are landed at Greenville hotel, feeling that we have been amply repaid for our trip. F. B. A.

### A New Tunnel Project.

The Owyhee (Idaho) *Avalanche* says: The proposed project for tunneling Florida mountain is one of vast importance to this section of the country, and the sooner the enterprise is commenced the more certain will be the approach of prosperous times in this vicinity. Our best and most experienced mining men entertain the belief that the interior of this mountain is one vast net-work of veins, of which the Knott ledge, as developed thus far, is but an ordinary sample. At a greater depth the ledges will undoubtedly prove to be better defined, greater in extent, and showing up more prolifically in gold. The diggings that have been encountered on the stream directly below this mountain during the past few years, furnish the best evidence of the great wealth that exists there, and the certainty that the fountain head has a liberal share of the precious metals that generations yet to come must reap the advantage of. The gold taken out of these streams for several seasons is directly traceable to this mountain, whose formation is such as to furnish the very best evidence of the existence of ore bodies there on a large scale and in great profusion. The running of a tunnel as proposed by a new company, which we are pleased to learn is now in a fair way to be organized, will tap the ledges at a depth of several hundred feet, and aid in bringing to light the hidden wealth embodied in the heart of a mountain hitherto revealing such splendid indications. We believe that no more profitable mining enterprise could be engaged in anywhere at the present time.

### Marshall Tunnel.

Several hundred feet of this tunnel have recently been retimbered. The drifts, level, etc., connected with it—in fact the entire property of the Marshall silver mining company—have been securely repaired preparatory to extensive development, the total amount of new timber work being about 7,000 feet. This has been done at considerable expense, but it is permanent, and will probably stand 10 years without further attention. The engine, which has been shut down for repairs for several months, starts up again this week; its first task being to hoist 150 feet of water out of the deep shaft. It is 15-horse power, and capable of hoisting 40,000 gallons of water every 10 hours. It will be run night and day, and is expected to clean out the water in three days. When this is accomplished the work of sinking the deep shaft will immediately be resumed; and the company intend to sink it down 1,000 feet below the level of the Marshall tunnel. This is on the middle of the Colorado Central lode, and crosscuts will be run 60 feet apart, to the north and south walls. This lode never looked better than it now does, a large amount of ore being in sight.

Negotiations are now pending for the erection of concentration works in connection with the Colorado Central mine, to work up about 3,000 tons of low grade ore which is now lying on the dump, and for the further purpose of reducing a large amount of ore for concentration which is now in sight in the mine.—*Colorado Miner*.

### The Pony Mill.

J. C. Frick has just completed and set in operation a four-stamp mill for working ore from the croppings of the Sierra Nevada lead. The mill stands in the ravine just south of the Odd Fellows' cemetery. The mill building is 20 by 38 feet in size. The stamps weigh about 400 pounds each and are driven by an eight-horse power engine. At present the ore is being worked for gold only and most of the amalgamating is done in the battery, though below, in sluices, are copper plates coated with quicksilver. On these is caught the gold that passes out of the battery. The ore worked contains a considerable amount of silver in the form of chloride, and Mr. Frick contemplates putting up an amalgamating pan in which to save this at no distant day. The little mill is called the "Pony," and is capable of crushing six tons per 24 hours. Mr. Frick has on hand at the mill about 50 tons of ore, and some 15 tons more at the mine. By proper assorting the rock pays well for working. Pieces of quartz are frequently found that show a plentiful sprinkling of free gold. Mr. Frick commenced operations with a four-stamp toy mill, which crushed but about a ton per day, doing all the work himself. Four men will be required to run the new mill. There are undoubtedly many places on Cedar hill where ore that would pay well for working could be found by a little assorting.—*Virginia Enterprise*.

## MECHANICAL PROGRESS.

## The Cause of Blisters on Steel.

In the process of making steel, which is so largely practised at Sheffield, bars of iron, usually of Swedish or Russian manufacture, are imbedded in charcoal powder, and kept heated to bright redness during about a week or ten days, according to the degree of carburization desired. Carbon is thereby imparted to the iron, and steel is the product. The bars operated upon are generally about three inches broad and three-fourths of an inch thick. How the carbon finds its way even to the center of such bars, is a question not yet satisfactorily solved, though it possesses high scientific interest, and has been much discussed. At the late meeting of the English Iron and Steel Institute, a paper was read by Dr. Percy, the object of which was to communicate to the Institute experimental evidences as to the cause of the singular phenomenon which accompanies this process of converting iron into steel, viz., the occurrence of blister-like protuberances on the surfaces of the bars. This appearance is so characteristic and so constant, that the name of "blister-steel" is applied to such bars. The protuberances are hollow, exactly like blisters, and vary much, both in number and size; some are not larger than peas, while others may exceed an inch in diameter, and they are always confined to the surface of the bars, for there is a specimen of "blister-steel" in Dr. Percy's collection, in which there is a single blister as large as a small hen's egg, protruding equally from each of the opposite surfaces of the bar. Dr. Percy concluded that it had been conclusively proved that all bar iron manufactured by charcoal finery processes, or by puddling, must contain, intermixed, some of the slag, which results from the conversion of pig-iron into malleable iron by such processes, in which, let it be remembered, the malleable iron is never actually melted.

On a visit to the great steel works of Messrs. Firth, at Sheffield, in February last, Mr. Chas. H. Firth undertook at Dr. Percy's suggestion, to settle the question whether blistering would occur in the converting process in the case of a bar of iron which had been actually melted and so freed from all intermixture of ferrous silicate or magnetic oxide of iron. The experiment, says Dr. Percy, "was accordingly made, and with good effect, of confirming, and, I think I might almost say, establishing the correctness of the explanation which I ventured to submit concerning the cause of the formation of the blisters. On the 9th of last May, Mr. Firth informed me that he had melted Swedish bar iron, and cast it into a flat ingot, which he had carburized in the converting furnace in the usual manner; and, at the same time, he forwarded to me a piece broken from the ingot after conversion; this piece was about six inches long, three inches broad, and a little more than half an inch thick; it showed a fracture at each end, characteristic of converted steel, but there was not the slightest indication of a blister."

**METHOD OF SHRINKING ON TIRES.**—The beating of tires by means of hot water instead of by direct contact with fire is brought forward through English sources. It has thus far been applied to railroad work, but possibly it is susceptible of other applications. The record of the late experiments is as follows: The expansion of tires by hot water, though not claimed to be new, is believed by the author to be much superior to the ordinary method of using fire. As applied on the Moscow-Nijni railway, an iron tank, one-fourth filled with water, is fixed near a stationary boiler, a steam pipe from which is led through it, capable of heating the water to 212° Fahr. Into this the tire is plunged by means of a portable crane, and after an immersion of from 10 to 15 minutes, is taken out and immediately placed on the wheel. Three men only are employed, who will fix from 12 to 14 tires in a day of 11 hours. The allowance for shrinking (the difference between the diameter of the skeleton and that of the tire) is 0.75 millimeter to a meter. This is ascertained by gauges of great accuracy, and, if deviated from, the tire will be either loose after cooling or too small to get on the wheel. When fire is used, the tire can never be heated equally or cooled equally in all parts, and, in consequence is sure to be more or less oval in form, which is not the case in hot water. The above railway made a comparison between the two, the results of which are given. It appears that, during a six years' trial of fire-shrunk tires, 37% ran loose and 5% were broken; while, during a three-years' trial of water-shrunk tires, less than 1% ran loose and only a single tire was broken. The liability to breakage in the former (produced by the irregularity in form) is much insisted on by the author as being, of course, far more dangerous and costly than the mere loosening of the tire.

**RIVER BED MINING.**—About 50 anchors and an immense quantity of chain were raised from the bed of the St. Lawrence river, Quebec, recently. This nest of iron was the accumulation of years, and took the lifting barge about a month to effect the raising.

## Export Trade in American Manufactures.

There recently assembled in Philadelphia a body of men connected with our manufacturing interests, forming "a convention of the associated industries of the United States." We know nothing of the association, except that the *Western Manufacturer* speaks in favor of it. We read that it devoted time to devising ways and means for practically relieving our overcrowded markets, and paving the way for a large production, and thus providing for the employment of the thousands of workmen now idle, and suffering all the hardships of such a condition. A committee was appointed to make investigations in regard to foreign markets with a view to increasing our export trade, to place samples of American manufactures in all foreign markets, and demonstrate their superiority over those of other nations, and also to learn and report the special kind and quality of goods most in demand among nations with whom we have heretofore had little or no trade. This committee in a report already submitted, say: "Enough has already been done to justify the present reference to it, and to show the need of some precautions. In the few months of the present year, the direct export of Philadelphia manufactures in new articles, not sent in any quantity previously, is about two millions of dollars in value, and the indirect export by way of New York much greater, so many being sent there for shipment." Among the classes of manufactures in which an export trade has been established, may be mentioned "wood-working machinery, hydraulic works, including pumps, the higher forms of agricultural implements, house building and bridge building appliances, cotton and woolen machinery, cotton prints, bleached cottons, gingham, and various forms of colored cottons, cotton mixed goods, worsted goods of various classes, gas meters and gas works, carriages and carriage equipments, leather, ladies' and children's shoes, oil cloths, hats, caps and straw goods, drugs, paints, books, paper and stationery, scales and balances, hardware and tools of every class, lawn mowers, etc."

**ARTIFICIAL BLACK WALNUT.**—A Belgian journal says a new process has been applied to the manufacture of artificial black walnut, by which ordinary wood has imparted to it the appearance of the most beautiful specimens of walnut, adapted to the very finest cabinet work. The wood, first thoroughly dried and warmed, is coated once or twice with a liquid composed of one part by weight of extract of walnut peel, dissolved in six parts of soft water, by heating it to boiling, and stirring. The wood thus treated is, when half dry, brushed with a solution of one part by weight of bichromate of potash in five parts of boiling water, and, after drying thoroughly, is rubbed and polished. The color is thus said to be fixed in the wood to a depth of one or two lines, and, in the case of red beech or alder, for instance, the walnut appearance is most perfect.

**FLOORING TILES OF ASPHALT.**—The London *Building News* states that at the Bavarian Industrial Museum may be seen a collection of square tiles of asphalt prepared by a new process, and intended for floorings. The tiles are ornamented with mosaic, in white china or colored glass, which may be arranged according to any design. The drawing to be reproduced is traced on a sheet of thick paper, which is afterward covered with the various fragments of china or glass, which will form the mosaic; a border is made to the sheet, and boiling asphalt poured upon it. After the whole is cooled, the paper is taken away with cold water, and the tile is finished. A flooring covered with such tiles bound together by a string of asphalt appears to have been made by a single melting, and has a good appearance. It indefinitely resists damp, and is consequently useful in bathrooms, halls of houses and balconies.

**IMPROVEMENTS IN THE CAPITOL AT WASHINGTON.**—The *American Architect* says that the new ventilating and heating apparatus of the hall of the House of Representatives has proved to be a great success. The new plan was introduced by Edward Clark, architect of the Capitol, in accordance with the report of the board of United States officers, convened at the request of the Committee on Public Buildings in the last House. An appropriation of \$33,000 was then made. The fresh air is now taken direct from the grounds of the capitol, through the terrace, and is tempered by the warm air in winter from the hot water coils, while in summer it is thrown into the building direct from the grounds. A series of ventilators to carry off the foul air have taken the place of some ornamental pendants in the ceiling.

**SUBSTITUTE FOR LINK MOTION.**—The master mechanic of the Midland railroad shops at Norwich, Conn., is reported to have invented a substitute for the "link motion," which employs but one eccentric, and accomplishes all which that famous method of working valves does without its complication, and with the expenditure of less power. The link motion is in itself so perfect, so simple and so admirably adapted to the uses to which it is put, whether upon the locomotive or marine engine, that it is almost impossible to credit the statement in regard to this invention. Although so nearly perfect, the link motion is still susceptible of very material improvement, and it is quite probable that in time it may be greatly modified with advantage.

## SCIENTIFIC PROGRESS.

## The Value of Science to Artisans.

At the annual meeting of the Birmingham and Midland Institute, England, the chairman, Mr. J. Thackeray Bunce, in the course of his address spoke at some length on what we may term the commercial value of scientific knowledge, or on the value of that kind of information to those engaged in manufactures and industrial pursuits of all kinds. We quote the following eminently true paragraphs: "By a study of science at this time, we do not mean study in its highest and best sense, a search after knowledge for its own sake, but that amount of study which is undertaken for the advantage it gives in competition with other manufacturers or professionals, and with other nations. As a nation we must be workers, producers; we cannot afford to wander about the by-ways of learning for the mere pleasure of gaining knowledge; we must, or the great majority of us must, tread the broad roads already graded and laid out by previous workers, picking up all the information we can, and storing it in orderly fashion in our mental wallets for use by and for. Others among us—a gradually increasing number—will strike out paths for themselves across untrodden fields, and seek for new treasures with more or less success. We cannot all make researches and experiments, nor are we all fitted for the work; but we can all learn something of what is known already, and so prepare ourselves to take advantage of and utilize the discoveries of scientific investigators."

Every artisan in the kingdom can, if he will, make himself acquainted with the principles on which the practices with which he is familiar are based, and there is no industry in the country which would not be benefited by such knowledge on the part of its workers. In a few years now a considerable portion of our workers will be men who are more or less well grounded in theory; they are receiving a technical education, and when they enter the ranks of the industrial army they must, in the natural order of things, occupy prominent places. Even now Whitworth's scholars, at present a comparatively small number, make their way readily to the front, and in competition with mere rule-of-thumb men gain an easy victory.

## Optical Characters of Minerals.

A new method of studying characters of minerals was lately described by Mr. Sorby, F. R. S., in a paper read before the British Association. The author first described the principles on which the method depended, and that the great difference between the appearance seen with the naked eye and the microscopists due to the object glass being able to collect divergent rays. In looking with a low magnifying power at a small circular hole seen through a section of a crystal, very different phenomena present themselves, according to its optical characters. If double refraction only one well-defined circular hole can be seen. If the mineral possess double refraction and only one optic axis, like calcite, two images of the hole are seen. If the section be cut perpendicular to the axis, two circular holes are seen directly superimposed, but at two different foci. If the section be in the plane of cleavage, two widely-divided images are visible, the one due to the ordinary ray being circular and the other due to the ordinary ray being distorted and drawn out in two opposite plains at two different foci. When the section is cut parallel to the axis, this image due to the extraordinary ray is still more elongated, but the images are directly superimposed. We thus at once learn that the mineral has double refraction, has an optic axis, and also what is the direction in which the section is cut. In the case of crystals like Arragonite, which have two optic axes, there is no ordinary ray, and at the focal points we see the circular hole is drawn out in opposite planes into crosses. The character of these crosses depends upon the direction of the section, but the fact of the crosses being seen at once proves the mineral has two optic axes. Some facts are better observed if, instead of a circular hole, we examine through the crystalline plate a grating with two systems of lines at right angles to one another. We then obtain what the author calls unifocal or bifocal images, according to the system of crystallization. Crystals with double refraction have only one unifocal image; crystals having one optic axis have one unifocal and bifocal image; whereas crystals having two optic axes give two bifocal images. The definition of unifocal is independent of the position of the lines; whereas in the case of bifocal images the lines are distinctly visible only when they are parallel or perpendicular to a particular axis of the crystal and, spread out, become obscure and disappear when rotated to a different azimuth. The above-named general characters differ so much in different minerals that they furnish a most valuable means for their identification.

**THE EQUATION OF ERROR.**—The *Iron Age* notes that by numerous experiments it has been proved that one who observes and records an occurrence always gives a result which differs from the exact truth. Even where the observer has been trained and skilled in observing events like those in the most accurate experiments, the rule is the same. He records the time too early or too late. The error appears in each experi-

ment, and always to the same amount. If the record was too late in one, it invariably was too late. This habitual difference between the time as noted by an observer and the actual time of the happening of the occurrence is what has been termed the absolute personal equation of that observer. It represents the amount of error which he will always make. It has been found to differ with different persons for the same class of events. It also differs in the same persons for events of different classes. The time required to observe and record the happening of a sudden and unexpected spark, for instance, is always greater than that required in the case of the expected appearance of a letter or figure thrown upon a screen. The equation also differs according as the facts are observed by the use of one of the senses or another. The time required for some of the senses to convey intelligence to us is far greater than that required by others.

**FOOD AND RESPIRATION.**—The *Chemical News* gives an outline of some researches on the consumption of oxygen and the excretion of carbonic acid in man, by Dr. Speck. The author has examined the changes produced in the respiratory process by the use of fatty food, of coffee, quinine, alcohol and water, and by the inspiration of air respectively rich in carbonic acid, poor in oxygen, and rich in oxygen. His chief conclusions are: 1st. With an increased proportion of hydrogen in diet the amount of the air inspired and expired decreases. Nutrients, such as sugar, which contain little hydrogen in comparison with their oxygen, involve more exertion of the respiratory organs than such as are rich in hydrogen, like the fats. 2d. The more carbon predominates in the food in proportion to hydrogen the more air is exhaled in proportion to that inhaled. 3d. The more carbon increases in the diet in proportion to hydrogen, the more carbonic acid is evolved and the more oxygen is taken up; the richer the diet in hydrogen the less oxygen is required. An atmosphere containing five or six per cent. of carbonic acid could be breathed for some minutes without oppression. At 11.51 per cent. great exertion was needed to breathe for one minute. At 7.2 per cent. all the carbonic acid produced in the body is retained in the blood, and 11.2 per cent. a great part of that also which is inhaled.

**IRON OR BONE.**—We read that the town of Hazleton, Pa., has been excited during the past few days by what was, and by some is still, supposed to be portions of a gigantic fossil skeleton of some hitherto unknown monster. A piece shown to Prof. Leslie was decided by that gentleman to be iron ore. Notwithstanding the opinion of so high an authority, there are some who still contend that a veritable skeleton has been discovered. The formation of the pieces that have been preserved are certainly very peculiar, one piece in particular bearing a very striking resemblance to vertebrae, showing joints and protuberances at regular distances, and unlike the most fantastic geological formation ever seen. As Prof. Leslie was obliged to form his opinion from a single piece that had been sent him for examination, it was determined to have the largest and most peculiar parts subjected to a further test. Accordingly, Prof. Prime, of Lafayette college, examined the supposed fossil remains. He was unable to decide what they were, and by his advice they were sent to Philadelphia for the inspection of Prof. Leidy.

**INCOMBUSTIBLE WRITING PAPER.**—Two Spanish gentlemen, of Salamanca, have just obtained a patent in Spain for making writing paper incombustible. A number of experiments have been made with the process, and the results are said to have been very satisfactory. The paper will not burn, no matter what may be the intensity of the heat applied. A single sheet submitted to the direct action of a flame will carbonize, but does not take fire. If a roll of prepared paper is placed in the hottest fire the outside leaves will carbonize and the edges for a short depth, but the interior remains unaltered, the writing or printing being perfectly legible. Its cheapness especially recommends it for public documents, archives, etc., which might be desirable to preserve. Papers already written or printed upon may undergo the process without injury. The patentees expect to make an arrangement with the government to apply the process in the manufacture of the paper used by it for public business, which can be done at a very trifling expense.

**NOTES ON PLANTS.**—The scientific writer for the *Independent* recently noted a remark of *Nature* that a variety "under cultivation" was no guide, and took occasion to say that "cultivation" in the discussion of these biological questions had little meaning. Since that remark the distinguished morphologist, Dr. Maxwell T. Masters, has published a paper on variations in primroses, in which he says that "cultivation" is not the cause of variation in this well-known genus, as he finds variations common among them in a wild state. This, we believe, is the experience of any botanist in any family, as well as in primroses. A singular rhythmic motion has been discovered by Rodier, of Bordeaux, in a water-plant (*Ceratophyllum demersum*). The axis curves to one side and to the other every four hours. It was clearly ascertained that light made no difference in the act. Last year similar motion was noticed in *Liatris*, in our own country, and it may be more common in plants than is generally supposed.

## THE ENGINEER.

### Projected Railroads in Japan.

Mr. R. V. Boyle, Engineer-in-chief of the Japanese government railways, has recently made an examination of certain lines believed to be most needed, and reported thereon, dividing the proposed lines into sections, of which he speaks separately. The first section is from Tokio, on the Gulf of Yedo, northwest to Takasaki, 66 miles, passing through Inatsuki, Omiya, Tuiyaka and Okahe. Much of the work on this section would be light, though some large river crossings are needed over the Toda-gawa, and protection of the road-bed against floods in that river would also be necessary. Takasaki is a town of much importance, with a considerable trade, and there is already much traffic along the proposed line, which could probably be much increased by the railroad.

The second section is from Takasaki nearly due west to Matsumoto, 80 miles, and this section will require some heavy work in the hills about Shanani and a tunnel about a mile and a half long at the head of the Shiroya valley. There is much broken and mountainous country along the line, requiring the heaviest grades and sharpest curves for the road, besides for most expensive work. But little local traffic can be looked for, but this section would be of value as a part of the through line and as connecting two populous provinces now separated by a mountainous district, crossed by few roads, and those very poor.

At Matsumoto the line turns sharply to the southward and runs in that direction 70 miles to Nakatsugawa-Yeki. The work on this section will be lighter than on the previous one, though some heavy grading will be needed on the divide between the Sai-Kawa and Kiso-Kawa valleys. For the most part, however, the line follows a natural and comparatively easy route through the river valleys, needing some bridging, but none of very large size. Much local traffic would come to the line, besides a considerable business in lumber, which is floated down the mountain stream.

From Nakatsugawa the road will turn westward and run in that direction 55 miles to Kano and Gifu, following the valleys of the Toki-gawa and Nemoto-gawa, and then crossing a low range of hills, down the Oahri-gawa and Kiso-gawa to Gifu. The grades on this division will be light, and the only expensive bridge needed will be that over the Kiso-gawa, near Doda.

These four sections complete a main line of 271 miles from Tokio to Gifu, and from the latter place a line already surveyed runs southwest 74 miles to Kioto, making a total distance of 345 miles from Tokio to Kioto. At the western end the line would connect with the 49 miles of road now in operation from Kioto to Kohe, and at the eastern with the 18 miles from Tokio to Yokohama. The line marked out connects two principal cities, and follows an already established route of travel and trade, which is believed to be capable of great development.

The last section surveyed forms a branch of this main line from Uyeda and Tanaki north by east to the important sea port of Niigata. This branch will require only a moderate amount of heavy work, though much of it is through a broken and hilly region, and a good many bridges will be needed. There will be little rock work, and most of that is through a light and easily-worked rock. For much of the distance the road follows the Chikuma-gawa, and it will have to meet the competition of boat navigation on that river for nearly 75 miles. Much of the line, however, is through a very rich rice country, from which a large traffic can be carried to the main line.

**THE METRICAL SYSTEM IN ENGINEERING.**—At a meeting of the Liverpool Engineering Society a paper was read by Mr. Dunkinfield Jones, on "The Advantages of the Metrical System in Engineering." After pointing out that the meter is supposed by some to be the ten-millionth part of a quadrant of the earth's meridian, he observed that for all practical purposes it would be just as useful if it were the eleven-millionth part. All that it is necessary to admit is that the meter is a convenient unit of measure, and that its length is equal to the distance between two points on a platinum bar in Paris, and is equal to 39.37079 English inches. The subdivisions are one-tenth part or decimeter, the hundredth or centimeter, and the thousandth or millimeter. He dwelt at some length on the interdependence of the metrical measures of length, capacity and weight, pointing out that the "liter," or cubic decimeter, is the unit of capacity, and the kilogramme the weight of a cubic decimeter of distilled water at the temperature of 4° C., and with the barometric pressure at 760 millimeters. To illustrate the great saving in figures which may be effected in engineering operations by the metrical system, he exhibited two diagrams representing ordinary railway working sections, and stated that the one prepared on the metrical system had nearly 20% less figures than the section prepared with the English measures, notwithstanding that they both represented precisely the same cutting and gave identical information at every point. He concluded his paper by hinting at there being some probabilities of a decimal coinage being introduced even before the metrical system of weights and measures.

### A Bridge for the Bosphorus.

While Turkey is in the throes of a bloody war two American engineers are planning a magnificent public work for her so soon as she returns to peace and peaceful arts. The leader in the plans for bridging the Bosphorus is Capt. Eads, whose fame is in the Mississippi's mouth, and his associate is A. O. Lambert, an experienced bridge builder. They plan a bridge about 6,000 feet long—over a mile. It will have 15 spans and will be 100 feet wide, and, save the masonry and flooring, will be built of iron. The height of the roadway above the surface of the water will be 120 feet, thus affording ample passage ways beneath the arches for ingoing and outgoing ships. It will be observed that this elevation of the bridge above the Bosphorus is some 60 feet less than that of the Brooklyn bridge above the East river, with the difference that the latter is a suspension bridge, while the former will present a series of 15 bold arches thrown over the most attractive waterscape in the world. The greatest feat of engineering will be the bold central arch, 750 feet span—over an eighth of a mile. This is the longest span ever contemplated, and its construction will necessitate the most careful labor and no small outlay of money. In order to accomplish this single portion of the work alone, two caissons will have to be sunk in over 100 feet of water; and this can only be done by cofferdams and special contrivances, in their completeness yet unknown to engineering. The current at the point where these piers will rest is very strong, coming through the Dardanelles from the Sea of Marmora, and rushing to the Black sea. The two central piers, constituting the backbone of the bridge, will be 50 feet thick, of solid granite blocks, locked together with iron braces. A side view of the bridge will present, below the highest points of the arches, an intricate system of reinforce braces. Besides the main span of 750 feet, there will be two spans of 500 feet each adjoining the central one, and the distance between the arches will go on diminishing as the bridge approaches either shore until the arches reach the minimum width of 200 feet.

By an invention of Capt. Eads a new feature will be introduced so that a train of cars, or any other heavy burden will not superimpose its weight at any one point over which it may be at the moment, but will be distributed throughout the 6,000 feet of the supports, thus making it an easy task to build an arch of 750 feet. This is accomplished by uniting all the main bracing from pier-head to pier-head, and connecting the minor rods, so that the whole forms a complete system, making one brace dependent on the other. The action of heavy weights of troops marching to a common step, of rapid locomotion by the cars, is thus instantly communicated through every foot of the supports, and every part is made to do its duty. Perhaps the magnitude of the undertaking may be better understood when it is stated that the main piers will be 270 feet high from the foundation to the summit. It is estimated that the cost of construction will not exceed \$25,000,000, and the time to complete it six years. It took about eight years to build the St. Louis bridge; but in the case of the projected one over the Bosphorus the conditions are very different. Excellent granite can be found in desirable quantities near the place of construction and the labor will be very cheap.

**THE DEEPEST BRIDGE PIERS IN THE WORLD.**—We read in the *Railway World* about a meeting of the directors of the Poughkeepsie Bridge Company, at Poughkeepsie. Before the business meeting the directors went in a tug to investigate the work done. The westerly pier was found to be fixed on the solid gravel bed 97 feet below the surface of the water. The granite is beginning to arrive, and the work of building the stone piers will be begun shortly. The second caisson is sunk 75 feet below the surface. The depth of the mud is greater than with the first pier, so that a foundation will be secured 112 feet below the surface. Both these caissons are immense timber structures, and will be filled with solid concrete to a point 25 feet below the surface, where the granite pier will begin. All the piers for this bridge will be sunk to a depth greater than that of any bridge piers in the world. There are to be four piers in all, and two will be completed to a point 20 feet above the water before the river freezes. The height of the piers above the water is to be 130 feet, and the depth of the truss 60 feet, so that the railroad track will be 190 feet above the water line.

**UNDERGROUND TELEGRAPH WIRES.**—We learn from an English exchange that a considerable mileage of overground telegraph in the United Kingdom has been replaced by underground wires during the past year. At the time of the transfer of the telegraphs to the post office, the total length of underground wire in existence was a trifle under 2,000 miles. On the 31st of March last it had been increased to a trifle over 3,000 miles, being more than four times as much in 1877 as in 1870. A considerable proportion of the increase in the mileage of buried telegraphs during the year has been in London alone. The aerial system was fraught with danger to life and property in the neighborhood of the wires. Under the new arrangement the telegraphic system generally will be less liable to interruption when the frosts and snows of winter set in.

### Arizona's Mineral Resources.

The *Arizona Miner* says: The mining news from the various mining camps throughout the Territory is looking up, and the prospect for a big yield in bullion from the few of the many rich mines being developed, seems certain; which will have a tendency to bring emigration to our borders in a greater ratio than at any period since the settlement by Americans. Along the Sonora line on the south, and to the east bordering on New Mexico, in Pima county, reports of rich finds and a healthy outlook is chronicled by the press, prospector and others who are authority from that section. New and improved machinery is taking the place of the old rude arastras, and where one ton of ore could be reduced in 24 hours, now the capacity can be increased to from 15 to 60 tons.

In Pinal county, although the mining enterprises are, as it were, in their infancy, much is being done which goes to show that the deposits of mineral are very valuable. Many new and costly mills are being brought in and erected, some of which are now, with steady and telling effect, pulverizing the glittering ores which are yielding satisfactory profits to their worthy owners.

Following this wonderful belt of mineral northward through the county of Maricopa, which can boast of valuable mining property, besides having the most extensive valley for agricultural purposes in the Territory, we strike the famous mines of Bradshaw, Humbug, Peck and Turkey Creek districts, where the din from the miners' hammer and pick resounds through every canyon and over every hill top. Capital is coming in, cahins are appearing like magic upon the various leads, idle men are being hired and put to work prospecting the mysterious recesses far beneath the cropping that stand like monuments, beckoning the hardy miner on to plunge deep for the great treasures buried in the dark beds of slumber, encased and held secure by the massive walls, rock-ribbed, which were formed by nature in the long past. Quartz mills are numerous throughout the county, and the shipment of bullion will justify us in the assertion that in no country are the mines more valuable than here in Yavapai, and with the completion of the new machinery now being put up, we expect the increase in bullion will exceed anything heretofore chronicled several fold.

To the west, in Mohave county, we have the McCrackin mine, which, in size and richness, surpasses the renowned Comstock of Nevada; and just now two new mills are under construction, which will be used in turning out the glittering bars of silver from this wonderful deposit.

During the next year we look for the population of the Territory to be doubled, and the day is drawing nigh when the State of Arizona will cause another star to be placed on the American flag.

### Mineral Hill.

We interviewed a late arrival from Mineral Hill yesterday, and he informs us that matters are quiet in that village. Supt. Plummer is busy examining the English company's ground, and making ore assays from rock selected from various portions of the mine. It is probable that the property will be prospected by means of diamond drills, the Superintendent boding to the idea that that method furnishes the most effectual and cheapest way of determining the position of the ore bodies supposed to exist in the hidden depths. The mine, as everyone familiar with the locality knows, yielded immensely from the croppings down to a certain depth, but very little system was used and the ground was honeycombed in every direction in search of the valuable deposits. The greatest depth attained was about 200 feet, when operations were suspended on account of dissensions among the English stockholders. Capt. Plummer, by reason of numerous experiments and a careful geological survey, is satisfied that the hill contains many hidden bonanzas. He has communicated his faith to the company he represents, and they have given him full power to proceed with such work as he may consider necessary. The chloriders are very anxious to have the mill start up, and claim that in that event there are hundreds of tons of rock on the hill that can be utilized and worked at a profit, both to the mill and the owners. This same rock is not of high enough grade to pay for shipment, and as a consequence is piled away on the dumps awaiting the commencement of operations at the mill. All the residents are very confident of the future prosperity of the town, and predict good times in the near future.—*Eureka Sentinel*.

**RAILWAY INJURIES AND DEATHS.**—A table of statistics recently published, shows that on English railways the proportion of passengers killed is one to every 17,000,000 carried; number killed or injured, one to every 488,908 carried; number of employees killed one to every 416; number of employees killed or injured, one to every 86. In Massachusetts, the same table shows one passenger killed to every 35,000,000 carried; one killed or injured to every 8,750,000 carried; one employee killed to every 650, and one killed or injured to every 304.

**TO CLEANSE JEWELRY.**—Use hot water and a clean brush; rub a little soap on the brush, then dip it into powdered borax and scour well; rinse in hot water, and rub dry with a clean towel, or chamois is better.

### The Unemployed at Eureka.

The *Sentinel* says: The influx of miners and laboring men to Eureka during the last two weeks has been very large, and as a consequence idle, but industrious men, who would work if they had a chance, abound, and are to be found on all occasions visiting the mines and furnaces in search of a job. We are informed that no less than 50 applications are made daily for work at the Consolidated reduction works, and the Richmond and K. K. have the same experience. At the time of changing shifts at least 20 men congregate at the furnaces in hopes of being put on in place of some absent feeder or slag wheeler. This state of things does not result from any suspension of operations in our mines as it is an undisputed fact that the rolls of the different companies show that a larger force is employed at the present time than at any other period during the year, but rather that Eureka has become the Mecca for all unemployed men in eastern Nevada. Tybo, Hamilton, Ward, and districts south of us are not as prosperous as they were a year ago, and the surplus population of those points naturally migrate Eurekaward, attracted by the stories of our prosperity. Besides the emigration mentioned, we are getting large accessions from Tuscarora, many of the surplus who are disappointed in obtaining employment, floating over this way. There is no speedy prospect of any much larger force being put to work this winter, as the products of the mines are limited to a certain extent, by the reduction capacity of the furnaces. The Eureka dumps are piled to overflowing and the four smelters are crowded with ore. The Richmond company are employing a sufficient force at the present time to more than supply their works. The same may be said of all the others in the district, with the exception of the Metamoras, which latter, will, on the completion of their new furnace, put on an increased force both at the mine and works. In view of the above facts, we advise all those in search of employment, who contemplate visiting this town, to seek some other locality as they will find every place already filled, and no opening existing.

### Water Freaks in Mines.

The *Virginia Enterprise* of the 14th inst. says: A few days since notice was made of the receding of the water in the flooded mines of some five feet in a single day, and that, too, without any help from the outside world. Singular as was this freak it has been more than equaled recently by operations in the Baltimore Con. Of late steam has been got up there with the intention of freeing the mine from water, preparatory to the resumption of prospecting. When the pumps were started, Superintendent Strother was surprised to find the water but 60 feet above the 1050-foot level. There is considerable water flowing from the 750-foot level of the mine, and, as the pumps had been stopped five months, he expected to find the water above that level. After the water had been lowered to the 1050-foot level, one evening the pumps on that level were attached. The capacity of the pumps is not great, as they are but nine-inch, but in five hours the water was found to have gone down 85 feet, and in its sinking away it had drained about 3,000 feet of drifts on the 1050-foot level. That the pumps should have lifted this water out is simply preposterous. Where could it have gone to? The Baltimore Con. is the deepest mine in American Flat, and the only one there working. The nearest place of corresponding depth is the Caledonia. There is no known connection between the two. The only explanation advanced is that the mine, wherever the water went to, was drained as the heads of intermittent springs and by the eiphon process. But even that is completely upset by the simple question: "Why did it not flow out sooner?" In fact, like some of the ways of the water in the flooded mines, it is simply past finding out.

**THE SONOMA MINES.**—The mines recently discovered in the Sonoma mountains, south of Guthrie's ranch, by Ulrich and Cook, and heretofore alluded to in these columns, are proving to be extensive and valuable. One of the ledges, named the Richard, which is now being prospected by the discoverers, is represented as being from 12 to 18 feet wide. We were shown last evening a certificate of assay of ore from this lead, which showed it to contain \$7.99 in gold and \$92.30 in silver per ton. If the lead contains much ore of this character a mining excitement in this vicinity will shortly be in order.—*Silver State*.

**THE ESMERALDA MINES.**—That the Aurora mines are looming up grandly it is only necessary to say that Lucky Baldwin, Boh Graves, Mackay, Fair, Ralston, D. O. Mills, M. Y. Yerington and others have the principal mines in their hands, and are now preparing to sink shafts 1,000 feet deep in the Del Norte, Juniata and other prominent mines in that section. The best mining experts have given it as their opinion that before another year Aurora will arise to all its pristine glory. Capital is needed everywhere in mining operations, and that the Aurora folks have now secured.—*Eureka Republican*.

The temperature of the water in the header of the Suto tunnel, 18,006 feet from its mouth, is 94°; that of the water in the flooded mines, at the depth of 1,900 feet, is 157°. However, the water in the mines was tapped at a depth of over 2,000.

**"Bobbing" for Quicksilver and Amalgam.**

A pair of industrious and ingenious Germans have hit upon a novel method of mining which is said to be paying them exceedingly well—just how well nobody but themselves know. The Virginia *Enterprise* says they are operating in the bed of the Carson river, some distance above the town of Dayton. Each man is provided with a half-inch iron rod about ten feet in length. At the upper end the rod is so bent as to form a loop or eye large enough to admit the hand, while at the lower end is a copper head about a foot in length, shaped like the head of a soldering iron and weighing some ten pounds. This head has quite a large octagonal bulge in the middle, and in each of its eight faces is a cavity about an inch in depth and nearly three-quarters of an inch in diameter at the top, forming a sort of tapering cup—the cavity being hardly half an inch in diameter at the bottom.

Thus it will be seen that in the head of each probe or "bob" are eight small cup-like cavities. The lower part of the head is drawn out to a tolerably sharp point, and at the upper part also tapers to where it is inserted into and riveted fast in the end of the iron rod. In using the tool the head is first coated in every part with quicksilver, that it may the more readily catch and hold any particles of quicksilver or amalgam with which it comes in contact.

In working the men go to the bed of the river, where there is now very little water, and selecting a place where the amalgam and quicksilver would be likely to lodge, as on the lower sides of boulders and at points where there are sharp curves in the river, they work their probes down into the sand, mud or gravel, as the case may be, and then begin churning. As they thus churn the quicksilver moves toward and into the hole, and either sticks to the sides of the "bob" or is caught in the small cavities we have described.

The "bob" is frequently lifted from the hole and cleaned of the amalgam it has accumulated by means of a small scraper. The cavities are more for use in catching the quicksilver that flows in at the sides of the holes when the ground is shaken than for collecting amalgam. As is known to all old California miners who have ever used a silvered spoon in cravering, the amalgam is of a clinging nature and is readily lifted out of a hole or crevice by means of a piece of silver or copper that has been quicksilvered. This being the case, any amalgam that may be in the bottom of a hole is lifted out on the point of the "bob." Much quicksilver may also be lifted out on the point of the tool by frequently wiping it.

As the river is lower than ever before known, the men are able to work almost anywhere, wearing gun boots reaching but half way up their legs. In "bobbing" they often work down half a dozen holes within a space little over a yard square. This is in places found to be rich. Often after sinking the first, or "prospect" hole, they leave and hunt a new spot—one that will pay for working.

As there are many hundreds of tons of quicksilver in the bed of the river, all of which contains more or less gold and silver, the two "bobbere" are doubtless making excellent wages. Their tools cost little, as they use nothing but the peculiarly constructed probes we have described, and they are at little expense for living, as they camp on the river and do their own cooking.

The work is tolerably hard when closely followed up, as some of the holes made are nearly ten feet in depth, and when a paying spot is found the tool must be very frequently lifted out and cleaned of the quicksilver and amalgam it has caught.

The men have been at work but little over two weeks, yet they say they have ascertained that there are tricks in the trade well worth knowing. The principal of these is that of having become acquainted with the kind of places in which the amalgam and quicksilver are likely to lodge and form paying deposits. Once they know these places they say they can work them even though there should be a considerable volume of water in the river, therefore they have marked and claim a number of the best spots found.

**UP AND DOWN.**—When stocks are all moving up those who have invested have a mighty high opinion of their judgment in stock matters, but when they begin to tumble every man who has invested begins to kick himself for being the biggest dunderhead on the Pacific coast. Another thing, too, is observable in this business of speculating in stocks, which is the manner in which a man who has stumbled into luck regards such as are losing instead of making money—he looks upon them as the greatest asses in the world—men to whom all opportunity would be useless—men who would not have wit enough to pick up golden eggs were they owners of a goose that laid them. In order that they may neither be pitied nor thought fools, we find a great many men who have always sold out just before a tumble in prices—they keep the fox tucked close within their shirts, swearing they let him go a week before, though he is still going for their lives.—*Enterprise*.

When the Idaho mine of Grass Valley pays its 101st dividend on the 1st Monday in January, there will be a celebration of the occurrence, a somewhat rare one anywhere.

The Black Diamond Coal Company shipped 8,000 tons during the month of August, and 6,000 tons in September.

**USEFUL INFORMATION.****How to Escape from a Burning House.**

People who act with the greatest presence of mind in cases of danger or in accident are almost invariably those who have been thought upon such matters and know beforehand just what to do. The knowledge of the proper method of action in case of danger is probably the best possible method of making a man brave and calm, and for want of this knowledge many lives are annually lost.

The Royal Society for the Protection of Life from Fire has published its directions to its subscribers, and some suggestions for others who may be at fires in London, the following of which are applicable in any city. These living in towns and villages will find the hints valuable:

"Every household should make each person in his house acquainted with the best means of escape, whether the fire breaks out at the top or at the bottom.

"Inmates at the first alarm should endeavor calmly to reflect what means of escape there are in the house. If in bed at the time, wrap themselves in a blanket or bedside carpet; open neither windows nor doors more than necessary; shut every door after them. [This is most important to observe.]

"In the midst of smoke it is comparatively clear toward the ground, consequently progress through smoke can be made on the hands and knees. A silk handkerchief, worsted stocking or other flannel substance, wetted and drawn over the face, permits free breathing and excludes to a great extent the smoke from the lungs. A wet sponge is alike efficacious.

"In the event of being unable to escape either by the street door or the roof, the persons in danger should immediately make their way to the front room window, taking care to close the door after them, and those who have charge of the household should ascertain that every individual is there assembled.

"Persons thus circumstanced are entreated not to precipitate themselves from the window while there remains the least possibility of assistance, and even in the last extremity a plain rope is invaluable, or resource may be had to joining sheets or blankets together, fastening one end to the bedpost or other furniture. This will enable one person to lower all the others separately, and the last may let himself down with comparatively little risk. Select a window over the doorway rather than over the area.

"Do not give vent to the fire by breaking into the house unnecessarily from without, or if an inmate, by opening the doors or windows. Make a point of shutting every door after you as you go through the house. For this purpose doors enclosing the staircase are very useful.

"Upon discovering yourself on fire, reflect that your greatest danger arises from draft to the flames and from their rising upward. Throw yourself on the ground and roll over on the flame—if possible on the rug or loose druggery that drag under you. The table cover, a man's coat, anything of the kind at hand, will serve your purpose. Scream for assistance, ring the bell, but do not run out of the room or remain in an upright position.

"Persons especially exposed to the risk of their dresses taking fire should adopt the precaution of having all linen and cotton washed in a weak solution of chloride of zinc, alum or tungstate of soda."

**Softening Water on a Large Scale.**

There was a paper read before the Mechanical Science Section of the British Association at Plymouth, England, by Mr. F. J. Bramwell, F. R. S., on a new mode of softening water, as carried out at the new lunatic asylum for the county of Middlesex, situated on Banstead Downs, Surrey. The water was pure spring water, obtained from a deep well in the chalk. This water was about 17° of hardness, and was therefore a perfectly fit water for dietetic purposes in its natural condition, but on being boiled it deposited the carbonate of lime in the boilers and pipes through which it was conveyed, and thus the author of the paper was led to urge upon the magistrates the necessity, if they wished to preserve their boilers and heating apparatus from being coated with carbonate of lime, of softening the water by Dr. Clark's process. This process is known to many as an extremely beautiful and simple one. The hardness of chalk waters depends principally upon their containing a certain amount of bicarbonate of lime in solution. Lime is soluble in water readily, bicarbonate of lime is soluble in water readily, but carbonate of lime is insoluble. If, therefore, the bicarbonate could be converted into a carbonate it would be deposited from the water, which would thus become soft. This conversion of the bicarbonate into a carbonate is effected in Clark's process by mixing with the natural water containing the bicarbonate a small portion, one-tenth to an eighth, of water in which lime has been dissolved. On these waters being united they instantly become milky, and after being allowed to stand for some hours the water again becomes bright, the carbonate of lime having fallen to the bottom. This operation, however, it will be seen, requires very large depositing tanks and a considerable expense, therefore, in plant, but Mr. Porter has recently invented an improvement upon Clark's process which appears to promise excellent results, and it has, after experiment, been adopted at Banstead. The principle and

mode of treatment, as far as the chemistry is concerned, are precisely the same as Dr. Clark's, but instead of waiting the slow process of deposition to separate the carbonate of lime from the water, the mixed water is passed through filter presses of a peculiar construction, wherein the very carbonate of lime itself is made the filtering medium for itself, and in this manner, within a quarter of an hour of the mixture having been made, perfectly pure and soft water issued forth. There are four presses at Banstead, and these are sufficient to filter an average hourly quantity of 60,000 gallons of the purest and softest water.

**A ROYAL CAR.**—From the *Wellington Republican* we take the following: The Jackson & Sharp Company, have just finished a narrow-gauge railroad car for King Oscar of Norway and Sweden, which for beauty and convenience is unequaled even by the one recently built by the same firm for Dom Pedro of Brazil, and exhibited at the Centennial. The car is built low to suit the numerous tunnels which occur among the mountain cliffs for which that country is noted, and is divided into three compartments. The smaller compartment is used for a toilet room and also contains the heating apparatus. It is elaborately finished, and furnished with every convenience which would contribute to the hygienic requirements and comfort of the royal family.

At the opposite end of the car is a large compartment for the king and his suite. It is finished in princely style with chairs upholstered with plush. The middle and large compartment is the parlor and royal rooms, furnished with sofas, chairs, lounges and very finely finished tables. The upholstery is of sage green silk tapestry, and is undoubtedly among the finest specimens of workmanship ever sent out from this city. The woods of which the interior is finished are maple, walnut and satinwood veneering, to which a very brilliant polish is imparted by the most skillful artisans. The violet predominates in the various shades in which the ceiling is finished, and is in perfect harmony with the velvety brussels which covers the floor.

**ANOTHER GRINDSTONE BURST.**—On Monday morning, Joseph Webster, a grinder, in the employ of the Bowling Iron Company, was engaged in grinding tools, when the grindstone—which was about seven feet in diameter, and weighed between four and five tons—broke into several pieces. The stone was turning at high speed, and the pieces flew in every direction. One of the pieces struck Webster in the face, killing him instantaneously; and John Thackeray was hit on the leg, and had to leave his work. Webster was sadly disfigured. He was a married man, but has left no family. The windows of the building were broken, and it was otherwise damaged.—*English Paper*.

**TO DETECT ADULTERATION IN VINEGAR.**—Procure ten cents worth of chloride of barium, dissolve it in pure water and add 20 drops to a wine glassful of vinegar. If the vinegar is free from sulphuric acid it will cause no change in its appearance, but if not it will become milky in color, and if allowed to stand will precipitate a sediment resembling lime. Two-thirds of the vinegar sold is thus adulterated, and its effects are very injurious. No one should neglect to use this simple test.

**GOOD HEALTH.****Ventilation and Draught.**

A writer in the *Popular Science Monthly* gives some definitions of ventilation and draught which all should bear in mind: Ventilation is the necessary change of air in a closed space, at which the velocity of the air is still taken for a complete stillness, and motion takes place all around our body. It must not be more than a little above 19 inches per second.

Draught is a one-sided cooling of the body or some part of it, frequently caused by a corresponding motion of the air, but also in other ways, as by increased one-sided radiation. The great danger is, in the first instance, the local perturbation in our heat economy, which has partly local consequences, but also and chiefly disorders the nerves, acting on the caliber of our blood vessels, our vaso-motor nerves which have to regulate the outflow of our heat. When we are in the open air, and the air is in more motion than the air of a draught, we speak of wind, etc., but seldom of draught, because the whole air current flows equally all around us, just as in a well-ventilated room, only with greater velocity.

The vaso-motor nerves, regulating the circulation in our skin, are beyond our control, and we cannot bid them to defend us simply at the place attacked by the draught. They know only how to serve our heat economy when the outflow of heat from our bodies is equal, or nearly so, on all sides. They mistake the local irritation for one spread over the whole surface, and act at once on this error. If one perspires and goes to the window with bare neck or chest, one feels a shiver not only there but all over the body, and the perspiration becomes suppressed accordingly. The blood, which at the time filled the blood vessels of the glowing skin, is displaced by the contraction of its channels, but by the misunderstanding of the vaso-motor nerves it is driven not only from the exposed parts but from the whole surface toward the internal parts. A draught, then, is injurious

only so far as it causes perturbations in our heat economy; and as these perturbations can be caused in different ways we often accuse the draught wrongfully.

**Permanganate as a Disinfectant.**

In its series on various disinfectants, to which we have made reference before, the *Polytechnic Review* alludes to the special uses of permanganate of potassa. It sums up its virtues and usefulness as follows: When small quantities of contagious matters are to be dealt with, it cannot be surpassed, either in the rapidity or thoroughness of action. When, however, large masses of organic refuse, fecal matters and the like must be treated, it is quite inadequate for the purpose, inasmuch as the available oxygen it contains will be quickly seized upon and exhausted by the excessive quantities of readily oxidizable substances therein, so that unless an enormous quantity of the salt were used its employment would be practically of no avail; and neither the ammoniacal odors, nor these of the offensive sulphuretted hydrogen would be fixed, unless large quantities of the mineral acids were employed in conjunction with it, a plan that is open to serious objection. The high price of the permanganate again would operate as a serious obstacle against such wholesale use, even were it not open to the objection of inutilty. As a chemical disinfectant (deodorizer), therefore, the permanganate is not to be recommended. When, however, small quantities of offensive or contagious matters are to be treated by direct contact, as wells of drinking water, or the walls, floors or furniture of ships, hospitals, sick rooms and the like, the application of the permanganate will be found very advantageous, inasmuch as it combines with an energetic action a total freedom—in virtue of its want of volatility—from the strong and, to many persons, disagreeable odor, which renders the use of the cheaper chloride of lime, and to a great degree of carbolic acid objectionable.

**THE DANGER IN ANILINE DYES.**—The *Medical Examiner* concludes that recent experiments have now, beyond doubt, established that aniline dyes, at least the reds and blues, are, in their pure condition, comparatively inert, and that the ill effects which have sometimes been attributed to the use of these dyes are traceable, not to the pure coloring matters themselves, but to traces of arsenic which they contained, and which arose from inefficient purification subsequent to manufacture. Enterprising scientists may always be found who are willing to become martyrs, for science or for notoriety, and the present inquiry has had its self-sacrificing hero in the form of Herr Seidler, of Riga, who administered to himself three-quarters of a grain of aniline red every morning for a period of five weeks, without any ill effects. When it is pointed out that a single grain of aniline red is said to be sufficient to impart a good pink color to fifteen gallons of alcohol, it would be necessary to drink an enormous quantity of artificially colored wine in order to equal a single morning performance of Herr Seidler. So far the question is practically settled, the only remaining difficulty being our inability to ascertain whether pure or impure coloring material has been used in any purchased article; and it will therefore be better, as a simple matter of precaution, to be on our guard against the indiscriminate use of aniline dyes for coloring purposes.

**CURE OF CORNS.**—Soak the foot in warm water for about a quarter of an hour, every night; after each soaking, rub on the corn patiently, with the finger, half a dozen drops of sweet oil, wear around the toe during the day two thicknesses of buckskin, with a hole in it to receive the corn; continue this treatment until the corn falls out; and by wearing moderately loose shoes, it will be months, and even years, before the corn returns, when the same treatment will be efficient in a few days. Paring corns is always dangerous, besides making them take deeper root—as will a weed, if cut off near the ground. Many applications are recommended to be made to corns, to burn or eat out, or soften them, but the plan advised above, by *Hall's Journal of Health*, is safe, is painless, gives most welcome relief in a few hours, and prevents a return of the corn for a longer time than any other remedy; and last of all, it costs nothing but a little attention; that, however, is the great drawback.

**FASTING.**—There are a few bodily ailments, says *Hall's Journal*, which are aggravated, and in some cases rendered incurable by insufficient diet; but with the exception of diphtheria and a few others, nine out of ten of all ordinary ailments are controlled, are arrested or permanently cured by a wise diminution of the amount of food eaten. This is particularly the case when there is no decided ailment, but a general feeling of discomfort or of unwellness. In all actively inflammatory maladies, where there is acute pain anywhere, total abstinence from all substantial food, from everything liquid or solid, except hot teas, is the sheet-anchor of safety, when not extended beyond 36 hours. No one should venture on a longer abstinence on any occasion without the advice of a physician.

**SPECKS BEFORE THE EYES.**—Cease to trouble yourself about the specks and you will probably fail to see them, especially if you find something to do and do it, keeping yourself in as good health as you can.

To these may be added the principal tunnels driven in the mining district of Smartsville:

Name of Tunnel.	Locality.	Length of Tunnel.	Average Grade of Tunnel.	
			Inches per Suica.	Feet per 100.
Babb.....	Thibuctoo.....	1,200	5 1/2	12 3/8
Pactolus.....	"	1,700	6	12 4/10

Pittsburg.....	"	900	6	12 4/10
Blue Point.....	"	2,250	6	12 4/10
Enterprise.....	"	1,200	6	12 4/10
Deer Creek.....	Mooney Flat.....	2,200	5	12 3/4

In the locating of drainage tunnels, or in the opening of hydraulic claims which do not require tunnels, that place is to be selected from which the sluices, running on the straightest line, with a given grade, can bottom the major part of the "pay deposit" at the smallest possible expense.

In the establishment of this line, due regard should be had for the dump, and allowance made for contingencies arising from changes, such as depressions and holes in the bedrock. It is advisable, besides allowing for grade and dump, to run the tunnel or cut from a point sufficiently deep to strike from 50 to 75 feet below the top of the bedrock at the point where connection is to be made with the surface.

This additional depth is a matter of judgment, and in determining it one should be governed by the character of the bedrock, extent of ground to be worked, and the position of the shaft. It is always an easy matter to case up the grade, but if the main line of drainage is once fixed, and proves to be too high, it is a source of endless expense, and is frequently fatal to the enterprise.

At the Pioneer mine, Grass Flat, Plumas county, the original owners in opening their claim ran a tunnel 4,000 feet long. When midway in the channel the tunnel was found to be 22 feet above the bedrock. The sum of \$60,000, expended in this work, was a total loss.

#### The Extension of the Tunnel and the Connection of Its Heading with the Surface.

When a tunnel is used to open a claim it should be driven well into the channel before any connection is made with the surface. The shaft which connects with the heading should be vertical.<sup>†</sup> Its size is to be determined by the requirements of the work, four by four or five by nine feet in the clear, according to circumstances. Whilst raising from the tunnel due precaution should be taken against accidents arising from the rush of water, sand and gravel which is liable to occur when the bottom of a deposit is tapped.

When a shaft five by nine in size is sunk it should be divided into two compartments, one of which will serve as a man-way, and in the event of obstructions arising in the other compartment, this one can be used in removing them. There is some difference of opinion as to the use of vertical shafts; also as to the expediency of making direct connection between the shaft and tunnel. Respecting the former, it may be observed that a vertical shaft, when properly timbered, is the most desirable and most economical to use for opening hydraulic claims. With drops 200 feet no difficulty in working has been experienced. As regards the direct connection of the shaft with the tunnel, where the work is well constructed, no trouble nor set-back will be encountered in adopting this method of mining. Where a tunnel has to be extended beyond the shaft it is sometimes convenient to sink the shaft off to one side of the tunnel, connecting it by means of a short drift. In general where an extension of the tunnel has become necessary, the shaft has been reduced to a drop off of 50 or 60 feet, or bedrock cuts have lowered it to a level, and consequently the tunnel as extended will diverge from the course of the main tunnel. This is especially the case when the main tunnel enters, as is most usual, the channel at an angle to its general course.

#### The Timbering of the Shaft, Etc.

To avoid any accident or trouble, such as might be occasioned by caving of the shaft, it should be strongly timbered and closely lagged, and lined on the inside with two-inch lumber to within, say, eight feet of the surface. This top being the first washed off is used for fall. When in soft rock the shaft should be timbered close with timbers of the requisite size. These timbers are then lined on all four sides with blocks of wood from four to six inches in thickness set on the end of the grain.

The bottom of the shaft can be protected against wear by using pieces of heavy logs or sticks of 12 inches square timber stood on end securely bound together, or it can be paved with heavy stones, but in many cases the bare bedrock only is used. The last 50 to 75 feet of the tunnel which connects with the shaft should be lightened from eight to 12 feet, and at their junction the ground should be securely timbered and protected.

With long tunnels it is advisable to sink a second shaft at a convenient distance from the heading. As a precautionary measure a man is sometimes placed in the tunnel to watch the runnings, and in such cases a second shaft is in-

disposable. Should an accident occur at the main shaft, by its caving or closing up, the second shaft would also afford the necessary facilities for re-opening the work.

#### First Washings Through the Shaft.

When a claim is opened by means of a shaft, the first washings through it should be done with care, and the surface, within a great radius as can be conveniently washed and drawn, should be cleared on all sides, before any descent is made by taking off the top timbers. Attempts to push this preliminary work have frequently caused an overcrowding of the shaft, resulting in its filling up or getting choked by caving. It is, therefore, essential that the gravel should be run so as to avoid the rush of material from caves; and to prevent the accumulation of rocks in the bottom of the shaft an excess of water should always be used.

#### The Grade.

The facility with which gravel can be moved by water depends mainly on the inclination which can be given to the sluices. The question of grade is, therefore, one of vital importance, and to carefully investigate and determine this question great care and skill are often required.

When the topography of the country admits of unlimited fall, the grade or incline upon which the sluices are set should be regulated by the character of the gravel to be moved. Where the wash is coarse and cemented, requiring blasting, or where there is much pipe-clay, a heavy grade is requisite. Strongly cemented gravel requires falls or drops to break it up. To

of the box is slightly raised, in order to cause a more general distribution of the materials over the riffles.

Sluices are made of 1 1/2 inch plank, tongued and grooved, resting on sills 4x6 inches. To securely tighten the bottom of the sluices, the planks should be grooved and then joined together by driving in a soft pine tongue. The posts are 4x3 inch scantling. The size of the sluice is regulated by the grade, character of the gravel, and quantity of water to be used. A sluice 6 feet wide and 36 inches deep, on a four or five per cent. grade, will suffice for running 3,000 to 3,500 miner's inches of water. One 4 feet wide, 36 inches deep, on a 4-inch grade to 16-foot boxes, will suffice for 1,200 to 1,500 inches of water, and on a four per cent. grade it is large enough for 2,000 inches. A sluice 3 feet wide and 30 inches deep, with a 1 1/2% grade is ample for 1,000 to 1,200 inches.

The requisite length of the sluice is determined by the character of the gravel to be washed, volume of water used, grade and size of sluices, the principle being to construct the line sufficiently long to insure the most complete disintegration of the gravel, thus affording ample surface for the grinding of the cement, and offering under such conditions the best facilities for the gold to settle in the riffles.

\* Double sluices are frequently used in large claims to advantage for continuous washings.

† Miner's inch, see further on in this article.

THE TIMBER LAND BILL.—Following is the full text of the timber land bill introduced in

Fig. 1. VENTILATION OF MINES.

Fig. 2.

prevent the loss of gold, grizzlies\* and undercurrents are used to relieve the sluices of the finer material containing gold already detached and being carried forward by a strong stream and heavy grade.

Experience so far has led to the adoption, in most localities, of what is called a six-inch grade, meaning six inches to the box 12 feet long, or say four per cent. grade. In some places, where large quantities of pipe-clay are washed off, nine and twelve inch grades to the box is used (six to eight per cent.); in others, on account of natural obstacles encountered, a 1 1/2% grade, or 2 1/2 to 3 inches per box of 16 feet is used.

Light gravel can be moved on an easier grade and with less water than heavy gravel, nevertheless, when a four per cent. grade can be ob-

the Senate by Chaffee, and now before the Public Lands Committee:

Be it enacted, etc., that all citizens of the United States, and other persons, bona fide residents of the States of Colorado or Nevada, or of the Territories of New Mexico, Arizona, Utah, Wyoming, Dakota, Idaho, Washington or Montana, shall be and are hereby authorized and permitted to fell and remove for building, agricultural, mining or other domestic purposes, any timber or other trees growing or being on the public lands, said lands being mineral and not subject to entry under the existing laws of the United States in either of said States or Territories, of which such citizens or persons may be at any time bona fide residents, and that Section 2461 of the Revised Statutes of the United States, and all

STEINHAEUSER'S FOLDING ANKLE BOOTS.

tained it is desirable, as it lessens the labor of handling rocks. Moreover, as light gravel is generally poor in gold, this deficiency can only be made up by washing large quantities of it. On the other hand, coarse gravel demands from four to seven per cent. grades, and a proportionate increase of water.

In washing heavy gravel, the water in the sluices should be deep enough (10 to 12 inches) to cover the largest boulders ordinarily sent down, whilst light gravel requires the water to run in sufficient force to carry the rocks washed through the sluice, and yet be in only sufficient volume to prevent the packing of black and heavy sand. If too much water is used, by superincumbent pressure the sand drops and packs the riffles. The best results are obtained with shallow streams on light grades.

#### Setting Sluices and their Construction.

In setting sluices, a straight line should be adopted, and where curves occur, the outer side

\* "Grizzly" where a drop-off can be made in a line of sluices, steel bars or pieces of railroad iron laid parallel, with spaces between them, are placed on the bottom across and in the end of the sluice, so as to discharge the boulders over an embankment, whilst allowing the finer material to pass between the bars and drop into the undercurrents. The grating formed by the bars is called a grizzly. "Undercurrents" are sluices, 15 to 20 feet wide and 40 to 50 feet long, set on a very slight grade (nearly flat) provided with riffles to catch the gold and amalgam. They are placed to one side, below the main sluice. See chapter by Chas. Waldeyer, *Raymond's Report*, 1873, pp. 415, 416.

† In Placer county, at some of the mines, the sluices have a grade from 15 to 24 inches per 12-foot box. Note.—Oro Consolidated, sluices 24 feet wide and 20 inches deep, grade 5 inches to 12 feet (or 10.41%), are calculated to run 700 miner's inches of water.

#### Mine Ventilation.

The following points on mine ventilation are taken from a lecture by Prof. Smythe, delivered at the Royal School of Mines, London:

It is found that a great number of mines are sufficiently ventilated by natural, or "spontaneous" ventilation. For instance, in driving a level to a distance usually of 50 to 80 fathoms, though occasionally as far as 150 fathoms, a natural ventilation will be set up, the air coming into the level along the floor, running as far as the end, then rising and returning along the roof. Similarly in sinking a shaft, especially if there be a little water trickling down the sides, it will be found that the air comes from the surface down the sides of the shaft, and returns up the center, and this natural ventilation is maintained to a greater or less depth. In both cases the natural ventilation is greatly assisted by the placing of a diaphragm, or brattice, horizontally in the case of the level, and vertically in the case of the shaft, so that the currents of air moving in opposite directions are prevented from rubbing against each other.

The same may be observed if there are two levels side by side, with occasional crosscuts communicating between the two, these being successively stopped up as a new one more advanced is formed; and the same is true of pits. On the small scale this principle is carried out in the use of air pipes or air boxes; usually square wooden pipes, with joints fitting into one another, and placed on timbers at the top of the level, or supported at one of the corners of the level, or, when they are employed on a larger scale—say two feet square—they will be placed on the floor; but in these latter cases it becomes a question whether a second level ought not to be preferred and introduced. In consequence of the objections to these pipes being of wood—their liability to decay, and to dry-rot, and the fungoid growths inside in moist places obstructing the current, and frequently imparting a disagreeable odor—other materials have been proposed and used, such as zinc, wrought-iron, cast-iron, etc., but in most instances wood is still preferred.

A natural ventilation is generally set up where you have two openings and these at different levels, where, for instance, in hilly ground you have an adit level from the side of the hill communicating with a vertical shaft opening higher up the hill, during a greater part of the year at least a current of air will pass through. And this current may be made to ventilate the parts beyond the shaft opening, Fig. 1, by leading air-boxes from the level between the shaft, S, and the mouth, M, of the adit, and continuing them to the end, E, closing up all other communication between the shaft and the lower part of the level by means of a door, D. Then when the air is going in the direction from the adit to the shaft it will follow the direction of the arrows in the figure.

If on similarly irregular ground, Fig. 2, we have two shafts, A, B, C, D, then leaving out of consideration, in both cases, the column of air above the level of the shaft, A, B, we have in the first shaft the pressure of the column, A, B; in the second, of the column, E, D. On a cold winter's day the column, E, D, will be the heavier, and a current of air will set down the shaft, C, D, and up A, B. On a hot summer's day the reverse is the case, the air in A, B will be colder than the column E, D, because the portion B, C is exposed to the sun, hence a current will now be established down A, B and up C, D. In the case of many mines, however, the ground is flat, and the shafts are of the same level. The necessary difference of level is sometimes secured by building up a regular stack over one of the shafts. But it may be that with equal shafts water dropping down one may cool the air there, and thus a tolerable ventilating current be set up and maintained. But in these cases a change in the weather may cause a stagnation in the air, and then artificial ventilation must be supplied, or the men withdrawn till the weather is again favorable. Mr. Nicholas Wood has shown that many thousand cubic feet of air can be driven through the mine per minute, in some cases by this natural ventilation alone.

#### Folding Ankle Boots.

We give herewith an illustration showing an improvement in boots and shoes, recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency by Geo. C. Steinhauer, of this city. The portion which surrounds the ankle is formed of one entire piece, having only one seam at the rear; and this ankle piece is made of such a size as to easily allow the foot to pass in or out. In order to secure it snugly to the ankle after the foot is in place, the piece has triangular folds made upon each side, as shown. These folds may be slightly stiffened, or have lines of stitching at their edges, so as to fold back properly and lie smoothly inside the ankle piece, and in this manner the size of the ankle piece is reduced so as to fit snugly.

A strap is secured to one side and passes around behind the ankle, through a supporting loop, while a buckle upon the opposite side receives the end of the strap, which may thus be drawn up as tight as desired. This forms a neat and expeditious method of securing ankle boots, without the use of any buttons, strings or other fastening, except a simple strap, and without making any openings in the sides or front. The inventor's address is corner Second and Jessie streets, San Francisco.

\* Where the bed rock disintegrates on exposure to the air, i. e. soft bedrock, it is advisable to allow for considerable depth when practicable.

† Occasionally inclines are used.

## Ward District.

The Ward *Reflex* declares that Ward is an anomaly; a deviation from regular rule. It says that all experts and mining men who have examined the mines there give it as their very decided opinion that the district is unrivaled in eastern Nevada, if not in the State. It says the ores are marvelously rich, and most extensive and not refractory. In another article in the same paper is published an opinion by J. B. McGee that the ore vein (channel) in Ward is 500 feet wide. And yet the district languishes. A prospect which, if discovered in the vicinity of the Comstock would set the coast on fire, goes for naught in Ward. The editor of the *Reflex* must not forget that until some brave and capable man or company makes a success in opening and working the ores of Ward district nothing will be done. There are plenty of men in San Francisco who will gladly put \$1,000 in a mine when there is a sure, or apparently sure, promise of a return of \$2,000; but they shrink from investing \$500 when it is perfectly certain to a thorough miner that there would be a return of \$10,000, unless some mining men who have succeeded leads them. The California street crowd follow certain leaders always. Were a quiet miner of Ward to go to San Francisco, carrying with him proofs which would be perfectly satisfactory to miners that his property was good, the chances are five to one that men would not stop to investigate his showing for a moment. But, without a showing, if one of some dozen men in the city would speak well of a claim and buy a little of its stock the whole crowd would rush for it. Then there has been litigation in Ward, which is still unsettled, and which has chilled the hearts of more than one man who wished in real earnest to make an investment in that district. Finally, the main company which has been operating there has been most unfortunate, and has had a tendency to drive people away rather than to attract them there. When some men like J. B. McGee takes hold of the camp, and shows what a thorough man can do, there will be no more trouble. There will be plenty of men who will want stock in Ward and who will cheerfully pay for a little interest what they might now secure the control of the district for. Men try to be wiser about mining speculations than in anything else, and, as a rule, after all, do not trust their judgments at all, but rather follow the crowd or some one who, through lucky investments, has become an oracle. They will not touch Ward now because neither of the rich stock sharps of San Francisco are known to have an interest. But let one of those men invest in a mine in Ward; let him give \$25,000 for an interest and incorporate it with 100,000 shares, and say it is good, and the stock will sell readily at two dollars per share, even though the purchasers know that there is a mining proposition and a milling proposition, and forty other propositions, which will have a tendency to put off dividends. So, the men of Ward will have to half-sole their boots, reseat their pantaloons and rustle for a new sack of hoon, another hundred weight of flour, and wait until the tide, which is at the ebb now, shall begin to flow in favor of their district.—*Virginia Enterprise*.

**MINING TUNNELS.**—In working gravel claims where it is necessary to get a fall sufficient to carry off tailings from the bed of the channels, it is absolutely necessary to run tunnels to secure it. But in a majority of cases it is so much extra and almost useless expense to do such work, and particularly with prospectors with little money to open a mine with, it is not the wisest course to pursue. Many good ledges to-day lie idle because owners have exhausted all their means in trying to run a tunnel through hard bedrock to reach their ledge and had to give up before the object was accomplished. In most instances a tunnel will cost more than hoisting and pumping machinery, and all that is gained is an outlet for water without hoisting to the surface, where it is always needed for working the machinery. Those who are unable to purchase, can, in most cases, rent machinery and by so doing do systematic work toward permanent development. It is a mistaken idea to think of economizing by mining tunnels to open up quartz mines where owners have but little means.—*Nevada Gazette*.

**A NEW DISCOVERY.**—An extensive vein of silicated talc of a very superior quality has recently been discovered on the Homestead mining company's ground, lying but a few feet from and parallel with the company's ore vein. Several tons of the material have already been taken out and placed in store for shipment as soon as a market is found. This new and unexpected find, situated but a few dozen yards east from the Gold Hill *News* office, creates a new and interesting study for our local scientists, lying, as it does, in close proximity to a precious metal ore vein. It is also an additional attraction to the Homestead company's possessions, as they now have, within an area of three acres of surface ground, a true fissure vein of gold and silver bearing ore, a vein of silicon, a deposit of chromatic iron, and a living spring of alum water.—*Gold Hill News*.

**THE Dutch Flat Forum**, one of our Placer county exchanges, which commends itself for close attention to local mining interests, has just entered upon the third year of its existence.

## Good Placer Mines on South Boise.

Mr. J. B. Jones, just down from South Boise river brings substantial evidence of the richness of the mines on that stream and its tributaries. With two other men he has been operating during the present season, which has now about closed, on a section of the river about 24 miles above what is known as Junction bar, a point on the Rocky bar road. The distance from his claims to Rocky bar is 30 miles, and to Atlanta, across the mountains, about 25 miles. He worked one hydraulic pipe, using 125 inches of water from a ditch four miles long, constructed last spring. He and the men associated with him—five in all—own 20 acres of ground each, two claims being upon the main stream, and three upon a tributary called Smoky creek. The banks are 20 feet high, and the gold very evenly diffused through the gravel, which is easily washed. He estimates that his claims, which have been very thoroughly prospected, will pay, with good work, at least \$8 per day to the hand. There is a large extent of ground which prospects indicate to be equally good, sufficient to furnish claims for 500 or 1,000 men. Another company of three men mining upon Smoky creek, the present season, made a very satisfactory clean-up. Mr. Jones has well-founded hopes that he has secured a mining property which will suffice to insure him against the vicissitudes of fortune for the future. The miners in that section are all highly elated with their prospects and extensive preparations will be made for operating on a large scale next season. There is a wagon road to within 15 miles of the claims worked on the South Boise, and the country is easily traversed in any direction. The discoveries made in this region open up an extensive and rich field which will give a new impetus to placer mining in Alturas county.—*Idaho Statesman*.

**DEODORIZED PETROLEUM.**—A French chemist has devised the following process for removing the disagreeable odor of petroleum: Into 225 pounds of mineral oil he introduces, by means of a long funnel, two ounces of sulphuric acid and the same quantity of nitric, and about 11 pounds of strong alcohol is then poured carefully on the surface. The alcohol sinks gradually to the bottom, and coming in contact with the acids at the bottom, heat is developed with some effervescence. Ethernal products with agreeable odors are formed, and these impart a pleasant odor to the petroleum. The operation lasts about an hour; and after standing for 12 hours the mineral oil is siphoned off, and the remainder, a mixture of acids, alcohol and water, may be used for deodorizing the heavy oils, subsequently washing them with milk of lime. It is said that petroleum treated by the above process is sufficiently purified for use in pharmacy.

**ROCK CREEK.**—This district is in the northern portion of Elko county, and is making a very good showing. The Scorpion and Falcon mines are the two most noted properties in the district, and both bear promises of no mean caliber. The ledge has recently been struck in the Scorpion, which shows a two-foot vein, with ruby silver and black sulphuret ore in liberal quantities. The miners are much elated over the strike, and the property in the district is looking up. The northern portion of the State is giving indications of having been only half prospected.—*Eureka Republican*.

**CHLORIDING.**—Prospect mountain swarms with men, divided into little companies, engaged in extracting small bodies of ore; and the amount of ore reaching the furnaces from this source is very large in the aggregate. We are informed by a gentleman who is in a position to know, that at least 200 miners are following this chloriding business, and that their labor has been handsomely recompensed, the returns in most instances more than averaging ordinary miners' wages, and in some cases amounting to a snug little fortune.—*Eureka Sentinel*.

## Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers, S. F.

Thanks for Prompt Attention.

STOCKTON, June 26th, 1875.

Messrs. Dewey & Co., S. F.:

I have received the patent for my invention in wagon brakes, which you presented for me; patented May 11th, 1875—No. 163,940. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours,

GEO. G. BUCKLAND

Any person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinued.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KESTAL,

MINING ENGINEER AND METALLURGIST.

**Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver.** 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$5.50 cloth, or \$3 currency, postage free.

**Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.** 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

## UNITED STATES

## Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872; Mining Statute of July 26th, 1896; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Surveys Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that No Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that No Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests.

PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, S. F.

## Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patten's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles: Smelting, Mescal process, Chilean process, Krochne's process, etc. Under "Pulverizing Machines" are described the machinery and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, giving the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper bars, P. elberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc.

Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansome Street, San Francisco.

## Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

**Map of California and Nevada;** The Public Lands; The Land Districts; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.

**Instructions of the U. S. Land Commissioners.**—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College; Scrip; Pre-emptions; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissioners; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

**Abstract From the U. S. Statutes.**—The Law Concerning Pre-emption; Concerning Homesteads; Amendment Act Concerning Timber; Miscellaneous Provisions; Additional Surveys; Land for Pre-emption; List of California Post Offices. Price, post paid, 60 cents. Published and sold by DEWEY & CO., S. F.

## DEWEY &amp; CO.

## American &amp; Foreign Patent Agents

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

**PATENTS** obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

## Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurttemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agency.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

## Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

## Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes mis-carried, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

## Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## ARITHMETIC MADE EASY.

ROPP'S  
EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months.

The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Granaries, Bins, Wagon Beds, Corn Crib; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mechanical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided.

The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Prices, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter or receipted by express. Address

DEWEY & CO., San Francisco.

## MINING INTEREST FOR SALE.

For a small amount, in several claims on one of the  
**RICHEST LEDGES IN ARIZONA.**  
 Money needed for development. The ore will pay a handsome margin to ship to the city. Apply at this office.

San Francisco Cordage Company.  
Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tanned Manila Rope; Hay Rope; Whale Line, etc., etc.

FRED'K OGDEN, Sole Owner Tulloch Patent,

ROOM 72, NEVADA BLOCK.

Extract from a letter from C. G. Rodgers, Superintendent Green Mountain Mining Co., Plumas County, September 10th, 1877: After using both the Tulloch and Hendy Ore Feeders, side by side, for eight months, I can candidly say, that in my opinion, the Tulloch is much the best machine; it will feed any ore that can be fed by machinery; there is nothing about it to wear out, and should anything break, any blacksmith can repair it. Whereas, the Hendy machine is wearing from the moment it is started, and when any thing is worn out, or broken, you must have a machine shop or foundry to make the repairs. The Hendy Feeders are not in use at the Gold Stripe Mill; they were thrown out after a fair trial of some two weeks.

MINING ENGINEER and METALLURGIST.

P. O. Address: ALAMEDA, CAL.

Continued from Page 261.

opened out are richer and more extensive than any heretofore found in the mine. The furnaces will be started up on the 1st of November, and will make the most successful run since their erection. Several months' run is assured by the ore on the dump, and that in sight looks to indefinite prosperity. Mr. English gives an equally glowing account of the Gila mine in Revelle district. He says that the 10-stamp mill of that company will start up to-morrow, and that the most encouraging results may be expected.

#### WHITE PINE DISTRICT.

**BULLION SHIPMENTS.**—White Pine News, Oct. 20: Wednesday the Eberhardt & Aurora shipped by Wells, Fargo & Co. bullion valued at \$16,022.41, and on the same day the Stafford company shipped bullion valued at \$10,029.55.

**ANOTHER ORE CHAMBER.**—We are informed, by what we consider pretty reliable authority, though in no way official, that another ore chamber has of a certainty been discovered in the Eberhardt & Aurora mine on Treasure hill. Our informant states that the new ore chamber was discovered while following the stringers leading from the old chamber, but as to its extent and richness nothing is yet known, on the outside at least, for it seems to be the object of the management at present to keep the new discovery a secret. It is also stated that Capt. Drake's trip to San Francisco at this time is for the purpose of getting new machinery for the company's mill, which, after some necessary repairs, will soon be started up again and run all winter. While the miners working underground maintain an ominous silence in regard to the new strike, the people of Treasure hill and Eberhardt are confident that new and important developments have already been made in the Eberhardt & Aurora mine.

**THE NEW FURNACE.**—We learn that the King mining and smelting company are busily engaged on their new furnace at the Three-mile house. Mr. George Phillips, the engineer of the company, is now making the preliminary arrangements for putting up the machinery, which is expected to arrive in a few days.

**THE STAFFORD RUN.**—The Stafford company have finished a run of five weeks at the Eberhardt mill. About 700 tons of ore were crushed, which yielded \$23,000. The ore was worked up to over 80% by David Scanlan, the assayer for the company. This is 10% more than they expected. The boys have quite a nice stake, and now winter will pass over them lightly.

#### Arizona.

**BULLION.**—Arizona Miner, Oct. 12: The shipment of Peck bullion from the Azilan mill for to-morrow morning is only two bars, aggregating but \$3,417.44, a falling off, from some cause, of nearly \$2,000 from the recent tri-weekly shipments.

**TIP-TOP.**—Several contracts have been let for sinking shafts, etc., and Mr. Gillette has about 30 men at work on the mine and about the mill site. Everything is represented to be booming in that locality, and the mill will be up and running just as soon as money and enterprise can possibly bring it from San Francisco and set it up. There appears to be more work and less foolishness about the operations at the Tip-Top than anything that has hitherto been undertaken on so large a scale in Arizona.

**MINING ENTERPRISES** in the various districts have assumed a formidable shape, and work of a telling character is being prosecuted on many of the lodes.

**THE PECK COMPANY** are, with their poor facilities of working their ore, taking out \$10,000 per month. We consider their financial poor from the fact that all the ore has to be packed out on mules to their Azilan quartz mill, 30 miles from the lead, and over a rough country. This, however, will soon be done away with, as they have opened a wagon road to their mine and have succeeded in landing their new mill directly on the ground where it is to be erected.

**THE TURKEY CREEK MINES** are receiving their share of attention; work of a character that indicates business is going on steadily. These mines are situated on a tributary of the Salmon river, and are about 150 miles north-east of this city, via Idaho City and Banner. There is a wagon road from Idaho City to Banner, a distance of 25 miles, and from Banner to the mines on Yankee Fork the distance is 80 miles, over a mountain trail which has been used during the present season for packing ore to Craft's mill at Banner. Much of the ore taken from the ledges at Yankee Fork has been shipped through Montana to the railroad, and thence East for reduction. The ledges at recently discovered are numerous, and the fact that the ore can bear transportation so far fully establishes the richness of the veins. Mr. L. H. McFur, a practical quartz miner of many years' experience, has recently visited these mines and is much impressed with their importance and value. The developments thus far made, though partial, have convinced every one that a rich field is here opened which will add greatly to the mineral wealth of Idaho.

**THE BLACK WARRIOR** is one of the brightest constellations in the way of mines in the county and is being developed by home capital.

**MR. BRADSHAW** has the same glowing accounts come in to us from the numerous miners employed in the work of examining nature's vaults of minerals, in fact from every section of the county the reports are most favorable. New discoveries are reported daily and some of a very high and valuable nature, all of which has a tendency to make our future outlook bright and encouraging.

#### Idaho.

**YANKEE FORK MINES.**—Idaho Statesman, Oct. 20: All accounts from the locality known as Yankee Fork agree in representing it as one of the most promising mining districts in Idaho. These mines are situated on a tributary of the Salmon river, and are about 150 miles north-east of this city, via Idaho City and Banner. There is a wagon road from Idaho City to Banner, a distance of 25 miles, and from Banner to the mines on Yankee Fork the distance is 80 miles, over a mountain trail which has been used during the present season for packing ore to Craft's mill at Banner. Much of the ore taken from the ledges at Yankee Fork has been shipped through Montana to the railroad, and thence East for reduction. The ledges at recently discovered are numerous, and the fact that the ore can bear transportation so far fully establishes the richness of the veins. Mr. L. H. McFur, a practical quartz miner of many years' experience, has recently visited these mines and is much impressed with their importance and value. The developments thus far made, though partial, have convinced every one that a rich field is here opened which will add greatly to the mineral wealth of Idaho.

**MINING NOTES.**—Owyhee Avalanche, Oct. 20: The Oro Fino mine and works were sold on Saturday, C. W. Moore was the purchaser. Everything looks bright for the Poorman. Mr. Baldwin will probably start up the mine at an early day. There are about 30 men employed at the Wagon-ton mines and mill. Frank Lepile is talking out ore that will yield \$150 to the ton. Wilbur & Ryan are doing well at the Crown Prince. C. and J. Brunzell are getting out plenty of \$60 rock from the J. B. Dodd mine. The Webfoot will start up soon. The outlook for that camp is improving. Ben Davis has some rock assayed from the Sultan recently, and it went over \$200 to the ton. Work is progressing favorably at the Polost. More stops will be started soon. There is a considerable quantity of rock out awaiting shipping, and some of it will average as high as \$100 to the ton. At the Black Jack everything wears a flourishing appearance. The ledge is growing better as the work progresses, and great hopes are entertained in connection with the future of Florida mountain.

#### Montana.

**OUR QUARTZ MILLS.**—Butte Miner, Oct. 16: The Burlington mill is the only one running in this vicinity at present, but the Walker Bros. 15-stamp mill is about finished, steam having been raised day before yesterday. It is expected to make a final start this week. The repairs on the Dexter will be completed within two or three days, and that mill will also be set to work. Judge Davis will doubtless remedy at once the damage caused by the late accident in his mill, and it is only fair to presume that the owners of the Centennial are not going to allow that valuable property to rot in idleness. We are on the eve of a great revival of the mining and milling industry in Butte.

#### Oregon.

**PLACERS.**—Redrock Democrat, Oct. 17: The placer claim of Messrs. Baisley & Bulger, near Pocatobas, eight miles northwest of this city, has yielded the handsome

sum of \$11,000 this season. The work was done with hydraulic pipe and the labor of four men within the period of six months. This is only one developed placer claim. There are many claims equally as good in this vicinity waiting for patient labor and capital to develop their wealth.

The rich placer mines owned by the Lynch Bros., near Independence, Grant county, yielded handsome returns during the past season.

#### The Philosophy of the Hendy Concentrator.

[Written for the Press by CHAS. C. RUEGER, M. E.]

A comprehensive essay on wet concentration and the apparatus used therein, not long since appeared in the columns of the Press, from the pen of Mr. Francis Cazin. In enumerating and describing there, the various appliances of acknowledged merit for working fine sands, I think an injustice has been done to a California inventor, by excluding his machine from the list. Whether this was done because of a lack of knowledge of the efficiency of the machine, or because the experience with it had not been considered sufficiently favorable, I do not know. It would seem that the Hendy pan has been too long before the mining public to be unknown in any place where concentrators are needed. This leads to the conjecture, that the machine has not always been used to advantage, though much has been said in favor of it, and it will not be amiss to investigate some of the causes which have given rise to the differences of opinion regarding the merits of the machine. Such discussions, it is hoped, will only further and improve, and, by the statements of practical experience and observations, save others from a repetition of expensive yet fruitless experiments.

It cannot be denied that the working of the Hendy pan has frequently been unsatisfactory, although apparently all reasonable care was used in the management. This was caused in no small degree by mechanical defects, notably by the earlier arrangement used for the distribution of the ore pulp, insufficient provision for the maintenance of steady motion, and other parts of the machine since improved in construction. The improper regulation of the water and pulp supply, and an effort to do too much in one machine, and concentrate too highly at one operation, were also common reasons for the want of success. The condition of the sands to be separated, by peculiarities of the fracture, proportion of sizes, and properties of the component parts, causing excessive cohesion and insufficient freedom of motion, often unavoidably give rise to difficulties not experienced in the treatment of other sands, though the general characteristics of the two ores may be very similar.

The manner and extent in which these influences may exert themselves, may be deduced in a measure from a consideration of the agencies, to which the separating and concentrating action of the pan may be mainly ascribed, in so far as they come within the scope of our knowledge of positive natural laws, our observation and logical inferences.

The action of the Hendy pan represents that of a distinct class of concentrating machines, and differs materially from that of other successful machines in practical use. It comprises, really, several distinct actions, representative of our most approved means of concentration, the fortunate, though, perhaps, by the inventors, an unanticipated combination of which, enables the machine to work mixed sands—that is, unsized and ungraded—with better results than can be attained with any other machine in general use at present. Characteristic of the machines of this class is the sifting action, to which the separation in them is principally due; besides this we have the inclined plane action of the concave huddle, the centrifugal one of the dolly tub and separating funnel, and also that of direct displacement due to density. Near the surface and periphery we have also the separating effect produced by the difference in the initial falling speed of differently dense particles in still water.

#### Separation by Suspension and Subsidence.

The law in this latter regard, as worked out by Rittinger, is: In falling in still water, the denser of equal sized particles precedes the less dense; the same is the case, though in a less degree, with equal falling particles (particles assorted according to their equivalent speed of fall in water). It follows that the density, as well as the duration of subsidence, will determine the limits of size necessary to produce separation under this action. In its bearing to the Hendy pan, it is sufficient to know that this limit reaches beyond the dimensions of equal falling particles, because then the conditions favorable for the sifting action are attained, and come to our further aid in separation.

The alternating periods of suspension and subsidence, necessary to the development of this action, are produced in the pan by the changes of speed in the course of the oscillations, as they naturally result from the transmission of a regular rotary to a reciprocating motion.

If the accelerating motion of the connecting rod, in passing between the dead centers, is sufficient, the inertia of the particles will cause a retrograde motion of the sand in relation to the pan, which will be greatest near the surface,

where there is the greatest freedom of motion, assisted by the free development of the inertia of the water. The resulting projection of the upper particles against the lower ones, resolves itself into a projection in the direction of the greatest freedom of motion, which can only be an upward one. The inertia of particles will be proportional to their absolute weight, and the resulting projectile force developed under like conditions holds the same ratio. But the ratio of resistance to elevation will be as the densities diminished by one, the density of water. Of equal sized particles the less dense would tend to go somewhat higher consequently, and in this it is assisted by the free development of the inertia of the water, which produces currents, again tending to carry upwards the lighter particles. In the case of equal falling particles, provided they do not exceed certain limits of size, and the speed of the pan is sufficient, the action is the same, though in a less degree. In the periods of subsidence, resulting from the passage of the dead centers, the denser particles will reach a lower position than the less dense, the proportion of weight to resistance being in their favor.

Taking the case of quartz and iron pyrites, the inertia would be for equal sizes as their densities, or 2.6 to 5, and the forces of upward projection will hold the same ratio. The resistance to elevation will be as 1.6 to 4; the resultant to elevation will therefore be as 10.4 to 8, in favor of the elevation of the quartz. The carrying tendency of currents of water resulting from its inertia, will be in favor of elevating the quartz in a ratio dependent on speed of action and duration.

After each suspension, the particles will fall in the water with different speed. Supposing the machine to make 200 oscillations per minute, and that the free fall can take place during one-tenth of the oscillation, or 0.03 of one second of time, a grain of quartz one millimeter in size, or 1.25 inch diameter, would fall or sink 2.4 millimeters, while a particle of pyrites of the same size, would, in the same time, sink 3.26 millimeters, and consequently would gain on the quartz with each semi-oscillation 0.86 millimeters, or about 1.30 of one inch. If the whole depth to be traveled by the heavier particle, to reach the bottom, is three inches, it would therefore take about 45 oscillations, or about one-quarter minute to separate.

With particles of ore which have been graded the conditions are somewhat different. In this case the ratio of diameters of the particles will be approximately as their densities, diminished by the density of water. That is, the particles of quartz will have 2½ times the diameter of the pyrites particles, 15.6 times their volume, and eight times their absolute weight. The projectile forces would hence be as 1 to 8, the resistance to elevation as 1 to 6.24, leaving projection in favor of the elevation of the quartz. The influence of the upward currents of water would depend, however, on their speed relative to the size of the particles, for in an upward current of low velocity, the less dense particle has less negative motion than the denser, whereas, with a sufficient velocity of the current, this motion is reversed. From this the resultant effect on particles of various size can be inferred.

During subsidence the denser though smaller and lighter particle, will fall most rapidly, the difference of fall in the same time being not more than 20% less than in the case of equal sized particles. It is on this principle of suspension and subsidence that jiggers work so successfully.

#### Separation by Displacement.

But the trouble is, that complete suspension is attained in the Hendy pan only near the surface, while towards the bottom there is only a slight sifting motion to the sand. Therefore the sulphurets may readily disappear below the surface of the sand, but will soon reach a point where all possibility of the above described favorable action ceases, long before the bottom is reached, and they can penetrate further only by displacement of the quartz, unless they are fine enough to separate by the sifting action hereafter to be described.

Gravitation, acting on matter free to move, tends to arrange its components, from mechanical admixture, in the order of their density, and the rapidity with which this natural arrangement takes place, depends on the difference in densities and the sum of the resistances. In the case of fluids, these resistances depend on their viscosity alone; in the case of solid particles, on friction and cohesion, and the condition of the fluid medium necessary to mediate mobility. In the latter case, however, the ratio of gravities is changed, these being diminished by the density of the fluid medium. In the cases of wet concentration, the pressure downward exerted by the ore particles, will be proportionate to their density diminished by the density of water or in the case of quartz and iron pyrites, as 1.6 to 4. Therefore each particle of pyrites will counterbalance about 2½ times its volume of quartz. Any accumulation of the denser mineral in excess of this must cause a tendency to displacement of the less dense, by reason of the greater weight of the former, provided the particles of quartz were free to move. Their movement is, however, retarded by friction and cohesion, which latter is proportional to the surface of contact. The direction of thrust is also unfavorable to the downward movement of the heavier particle. The shifting of the particles, caused by the oscillations of the pan, assists the denser particle in wedging its way downward, by reason of its inertia reacting on the surrounding lighter particles. The poorer the ore the more difficult

the separation by these means, because the dense particles are surrounded by a much greater number of the less dense, which tend to keep in the same level, and thus combine to resist the displacing action of the particles.

This displacement, due to gravity alone, takes place principally during the periods of subsidence following the periods of suspension, while the crank pin passes the dead centers. The tendency at the height of motion being to raise the level of the sand at the periphery by centrifugal force, the decrease of motion at the end of the stroke will permit the particles to sink to rest and seek a level. It is thus that the denser accumulation towards the periphery, pulsating to the influence of varying centrifugal force, as by an ebb and flow of the tides, in its subsidence lifts the less dense inner accumulation of the pan into the sweep of the current to the central discharge.

To adjudge the effect of the centrifugal action of the pan, we must consider the law governing the motion of particles in water under such impulse.

#### Centrifugal Action.

The centrifugal force of particles is proportional to their absolute weight. Particles answering to the formula (diam. A)<sup>3</sup> sp. gr. A = (diam. B)<sup>3</sup> sp. gr. B, will therefore go together, where the water itself takes part in the centrifugal motion, as is the case in the Hendy pan; where it does not, as in the separating funnel, the motion being constant, the formula becomes (diam. A)<sup>3</sup> (sp. gr. A—1) = (diam. B)<sup>3</sup> (sp. gr. B—1). The rules to be deduced from the former conditions are:

1. The centrifugal force of equal sized particles increases in the direct ratio of their densities.

2. The centrifugal force of equally dense particles increases in the ratio of the cubes of the diameter.

3. Of graded particles, the denser has the least centrifugal force.

In the latter case, for instance, we have for quartz, sp. gr. 2.6; centrifugal force = 1. Iron pyrites, sp. gr. 5.2; centrifugal force = 0.111. Galena, sp. gr. 7.5; centrifugal force = 0.039. That is, with equal falling or graded particles of quartz, iron pyrites and galena, the centrifugal force of the pyrites is only 11%, and that of the galena only 4% of that of the quartz.

It is evident that this can effect but a limited separation, for it admits such only between the largest and smallest particles of sand, while the intermediate sizes of particles, answering to the above formula in a graduated scale, will remain mixed in concentric zones, merging between the extremes of separation.

The effect is analogous to that of grading, or the separation of particles according to their speed of fall in water, with the difference that while the diameters of equal falling particles in water, for instance in the case of galena and quartz, are as 1 : 4, they will be by centrifugal grading as 1:1.28 only. This shows that the effect approaches that of sizing with screens, in proportion to the decrease in the difference of density of the particles to be separated, and partakes more of the nature of grading, with the increase of such difference. It follows from this, also, that the effect of centrifugal action will favor the sifting action of the pan, in the ratio of the increase of density of the mineral to be separated, for the reasons hereafter shown.

#### Inclined Plane Action.

But this action of centrifugal force can only take place below the surface of the sands; on the surface it is counteracted by the inward current of water, which takes effect under conditions similar to those presented in the concave buddle, or huddle with central discharge. The centrifugal impulse given to the pulp in the pan causes it to rise one-quarter to one-half inch higher at the periphery than at the central discharge, and the surface of the sand thus takes the form presented in a flat concave buddle. The water, passing over the surface of the sand, on its way to the central discharge affects the particles in the same way as it does on inclined plane concentrators generally, with the difference only, that the current does not act in a direct or radial line to the discharge, but in a curvilinear course. The action is therefore a diagonal one, comparable, though not strictly, to that on the stationary, concave huddle with intermittent action, such as the Payne & Stevens; or, considering the centrifugal force as taking the place of the transversal percussion, the action is also comparable to that of the Rittinger percussion table. To those not familiar with these machines, I may explain that the tendency of a shallow current of water running down an incline plane with particles of different densities, is to move forward most rapidly the larger and the less dense particles, the rule, however, being qualified by the form of the particles also; a round particle of a denser mineral rolling more readily than a flat or disc shaped particle of a less density, though the latter may be considerably lighter than the former. Assuming particles of the same size and form, the impingement of the water would be the same on both, but the friction of the two with the surface of the incline plane, would be proportional to their density or weight, modified somewhat by the varying condition of the surfaces of contact. In the case of quartz, sp. gr. 2.6, and galena, sp. gr. 7.5, the former would travel down the incline in about one-third the time required by the latter. In the case of properly graded sands, the average proportion between the diameters of galena and quartz would be as 1 to 4, and the

leverage of the water to roll the particles down the incline holds the same ratio. The ratio of the surfaces of impact is as 1 to 12.56. If now these particles are placed together on an incline plane, and subjected to a shallow but continuous current of water, it is evident, that the water will act with greater force on the less dense particle, and at the same time the greater leverage, proportionate to its greater diameter. The ratio of forces thus derived will be as 1 to 50, in the case assumed. The weights, however, of the two particles are as 1 to 23, or in water, as here to be considered, as 1 to 15.8, and consequently the frictional resistance of the quartz to rolling action is about 16 times that of the galena. The ratio of motion will, therefore, be as 1 to 50-16 = 1 to 3.1 in favor of rolling the quartz.

This presumes an equal speed in the current of the water in its entire depth. The current, however, is less rapid in the lower strata, on account of the friction caused by contact with the plane, thus giving proportionately less impact against the smaller particles. It is evident, therefore, that the quartz will travel down the incline plane faster, so long as the speed of the current necessary to overcome its friction, does not suffice to cause suspension of the galena. This limit of action will be reached when the depth of current necessary to move the large particle, exceeds a certain proportion to the size and weight of the smaller particle; for the depth of the current will decide the speed, all other things remaining unchanged.

In the argument so far, a smooth surface of the plane has been assumed, such as is presented in the machines working continuously on this principle. Where the sand itself forms the surface of the inclined plane, as is the case in buddles, etc., of intermittent action, which presents more nearly the conditions in the Hendy pan, the factor of frictional resistance is further modified in favor of the denser particles, especially the smaller ones, because they sink most into the depressions of the surface and proportionately out of reach of the current.

### Another Colliery Disaster.

The telegraph brings us news of another horrible mining catastrophe, which occurred on Monday, at the colliery at High Blantyre, near Glasgow. Some 233 men descended into the mine on the morning of the explosion, only five of whom were rescued alive. The colliery comprises two pits with communication between them. In one of the pits 40 corpses were found at the bottom of the shaft. A faint knocking was heard, but as it was impossible to work at that part of the mine, on account of caving ground, the rescuing party is attempting to communicate with the men from another mine. Mining experts say that all the men in the pits must have perished, but even if any were alive no rescuing party could reach them in less than eight or ten days. The explosion was of a terrific nature, and all the bodies recovered are fearfully burned and mangled.

**LINDERMAN'S NEW BOOK.**—A treatise on money and legal tenders of the United States, by Dr. Linderman, Director of the Mint, will be issued by one of the New York publishing houses in a few days. It gives a clear and succinct definition of the various technical terms ordinarily used in connection with bullion, mining and money, and reviews legislative enactments upon these subjects from the Declaration of Independence to the present time. Credit obligations of the United States are referred to in detail, and the various propositions for the remonetization of silver are considered. A chapter on Exchange and Trade Dollars contains full information on these two subjects, which are of growing importance to American commerce.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: Northern Belle, Oct 14th, \$8,365.20; Standard, 15th, \$41,822.64; California, 17th, \$208,293.96; Leopard, 18th, \$3,500; Coso Con., 16th, \$1,523.10; Modoc, 16th, \$3,681.04; Grand Prize, 20th, \$16,800; Northern Belle, 16th, \$4,763.55; Arizona, 17th, \$1,499.37; Northern Belle, 18th, \$4,182.40; California, 20th, \$125,780.28; Arizona, 20th, \$1,073.86; Endowment, 20th, \$2,722.04; Meadow Valley, \$6,500; Con. Virginia, 20th, \$94,683.18; Indian Queen, 15th, \$4,301.31; Modoc, 20th, \$8,413.34; Grand Prize, 24th, \$16,900; Leopard, 23d, \$3,800; Endowment, 13th, \$1,801.

**COMPROMISED.**—A compromise between the Virginia Board of Aldermen and the mining companies has been effected. The mines will pay all back taxes, amounting to \$51,340, on condition that they shall be released from the penalties of delinquency. The rate of city taxation has been reduced from \$2.50 on the \$100 to 60 cents on the \$100.

In the suit of the Emma mining company vs. Trenor W. Park, Judge Shipman, of the United States Circuit Court, dismissed the complaint, the plaintiff not appearing. This is the end of the Emma mine suits.

LEAD is selling in Liverpool at £20 2s. 6d. to £20 10s. per ton for good ordinary brands.

QUICKSILVER is selling at £7 2s. to £7 5s. per flask in London.

## PATENTS AND INVENTIONS.

### List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING OCTOBER 9TH, 1874.

FRUIT DRIER.—Wm. S. Plummes, Portland, Oregon.  
WASHING MACHINE.—Louis Rivers, Auburn, Oregon.  
ROB CUTTING.—Theodore D. Culter, Westminster, Cal.  
FORMING AND LINING DITCHES, FLUMES, ETC.—John P. Culver, S. F.  
PRESERVING WOODEN PILES AND TIMBER.—John P. Culver, S. F.  
WELL BORING APPARATUS.—Jeroimo Hass and James Manning, Stockton, Cal.

#### RE-ISSUES.

ORE STAMP FEEDERS.—James Talloch, Jamestown, Cal.  
—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.  
NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

### General News Items.

GENERAL GRANT has gone to Paris.

THE steamship *Teutonia*, drawing 20 feet 9 inches, went to sea through the southwest pass from New Orleans, one day this week, without detention.

THE amount estimated for carrying inland mails the coming fiscal year is \$20,889,270, an increase over the estimates for the current year of \$2,030,297.

A STIPULATION against suicide in an insurance policy releases the company when self-destruction is committed. So the United States Supreme Court decides.

THE principal buildings of the Champs de Mars and Trocaderas, Paris, for the exhibition of 1878, have been completed, and the interior arrangement commenced.

THE reward offered for the capture of Duncan, the Pioneer Savings Bank defaulter, is \$6,000. The creditors of the bank offer \$5,000, and the Governor of California the other \$1,000.

THERE have been 12 vessels cleared, so far, the present month, with wheat for Great Britain. During the same period in 1876 there were 36.

In the Episcopal convention the question was briefly discussed as to what efforts should be made to evangelize the Indians on the Pacific coast. The project was warmly approved.

THE season at Emigrant Gap, Placer county, is about closed. The mills have all shut down, and are now preparing for winter. The shakes, wood, etc., are about all hauled in, and nothing remains to be done until the opening of the next season.

SAMUEL HUMPHRIES and Edmund Smith, who pleaded guilty of burning Lebanon Valley bridge during the late riots, were each sentenced to imprisonment at Reading for five years and a fine of \$1,000. The cases of 37 rioters have gone over, owing to the discharge of the jury in consequence of the manifest bias of two.

THE carpenters of the San Joaquin and Kings river canal are constructing the great dam across Los Banos creek, which has to be finished before the heavy rain sets in. Messrs. Miller & Lux have granted the right of way to the West Side Railroad Company for a distance of 57 miles.

THERE being no export demand at present for trade dollars, the Secretary of the Treasury has ordered the Director of the Mint to discontinue the receipt of deposits therefor at the several Mints until further instructed, and a general order to that effect, applicable to all Mints, was issued on Saturday.

THE failure is announced of the Carvill Manufacturing Company, engaged in carriage manufacturing on Jessie street. The liabilities of the firm are estimated at \$50,000, and the assets \$80,000, about \$21,000 unincumbered. Many of the workmen suffer from the failure. An assignment has been made to A. S. Meeker, of Meeker, James & Co., and D. T. Root.

OUR LOVED ONES.—Taken years ago when photography was in its infancy, the pictures of our loved ones are sometimes fading away, even as did they themselves. Copied and retouched by Morse, they again assume the expression and brightness we remember so well, and are treasures to us here. Enlarging such old pictures is one of Morse's specialties, at No. 417 Montgomery street.

THE famous Emma mine made its first shipment of ore on the 23d inst., after being shut down five years. The ore is of a high grade. Thirty men are employed in the mine, and the lessee asserts that hereafter shipments will be made every day.

PATENT SUIT.—Action has been commenced in the Federal Courts by Joshua Hendy against Ira P. Rankin, et al., of the Pacific Iron Works, and E. T. Steen, for an alleged infringement on Mr. Hendy's ore feeder patent.

WOONWARR'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

THE Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and the subscribers against the acts and mistakes of others.

"More than Pleased."

OSCEOLA MINE, NEVADA CO., CAL., April 10th, 1877.

MESSESS. DEWEY & CO.—Gentlemen:—We are more than pleased with your professional ability in the management of our application, and will always recommend your competency as Patent Attorneys, and your honorable and gentlemanly dealings with clients. Truly and respectfully yours,  
LOUIS R. TULLOCH.  
THOMAS D. TULLOCH.

## To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

### PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where he principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

### California and Oregon Land Company.

Location of principal place of business, San Francisco, California. Location of works, Jackson County, Oregon. Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of October, 1877, an assessment, No. 1, of thirty-five cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 418 California Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the twenty-eighth day of November, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Monday, the twenty-fourth day of December, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.  
J. W. CLARK, Secretary.  
Office, 418 California Street, San Francisco, California.

### Fresno Quicksilver Mining Company.

Location of principal place of business, San Francisco, Cal. Location of works, Mexico, Fresno county, Cal. NOTICE.—There is delinquent upon the following described stock, on account of assessment No. 5, levied on the nineteenth day of September, 1877, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Brown, W. E.	239	7000	\$140 00
Brown, W. E.	307	7000	140 00
Friedberg, Chas.	51	300	6 00
Friedberg, Chas.	217	100	2 00
Friedberg, Chas.	399	100	8 00
Haley, John J. trustee.	57	1000	20 00
Haley, John J. trustee.	88	1000	20 00
Haley, John J. trustee.	80	1000	20 00
Haley, John J. trustee.	90	680	13 60
Haley, John J. trustee.	255	4320	86 40
Haley, John J. trustee.	327	7000	140 00
Robinson, E. J.	200	500	10 00
Robinson, E. J.	201	500	10 00
Robinson, E. J.	330	1000	20 00
Robinson, E. J.	329	655	13 10
Robinson, Clara M.	204	25	50
Robinson, Clara M.	322	25	50

And in accordance with law, and an order of the Board of Directors, made on the nineteenth day of September, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 414 California Street, San Francisco, California, on Tuesday, the thirteenth day of November, 1877, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. R. WEGENER, Sec'y.  
Office, 414 California Street, San Francisco, Cal.

### Mariposa Land & Mining Company of

California.—Location of principal place of business, San Francisco, California. Location of works, Mariposa County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the twelfth day of September, 1877, an assessment, No. 12, of \$1.00 per share was levied upon the capital stock of the corporation, payable immediately in U. S. currency to the Secretary at the office of the company, room 33, Nevada Block, No. 308 Montgomery street, San Francisco, California, or to the Assistant Secretary, at the office, No. 9 Nassau street, New York, N. Y.

Any stock upon which this assessment shall remain unpaid on the fifteenth day of October, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Monday, the twelfth day of November, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. LEANDER LEAVITT, Secretary.  
Office, Room 33, Nevada Block, No. 308 Montgomery street, San Francisco, Cal.

POSTPONEMENT.—At a meeting of the Board of Directors of the Mariposa Land and Mining Company of California, held October twelfth, 1877, the day for the sale of stock on the above assessment was postponed until October twenty-ninth, 1877, and the sale day for such delinquent stock was postponed until Monday, November twenty-sixth, 1877.  
LEANDER LEAVITT, Sec'y.

### Merced Mining and Water Company.

Principal place of business, San Francisco, Cal. Location of works, Mormon Bar, Mariposa Co., Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the second day of October, 1877, an assessment, No. 1,

## Iron and Machine Works.

**PACIFIC ROLLING MILL CO.,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Con-  
necting Rods, Car and Locomotive  
Axles and Frames,  
—ALSO—

Hammered Iron of Every Description and Size.  
Orders addressed to PACIFIC ROLLING MILL  
COMPANY, P. O. Box 2032, San Francisco, Cal., will re-  
ceive prompt attention. Office: 16 First Street.  
The highest price paid for Scrap Iron.

MANUFACTURERS OF

**IRON CASTINGS**

and **MACHINERY**

OF ALL KINDS.

mont Street, Bet. Howard and Folsom

SAN FRANCISCO.

**SHEET IRON PIPE.**

**Risdon Iron and Locomotive Works**

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM  
PIPE, of any size and for any pressure, and contract to  
lay the same where wanted, guaranteeing a perfect work-  
ing pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special pat-  
terns for Mining Cars. These small wheels are made of  
the best Car Wheel Iron, properly chilled, and can be  
fitted up with the improved axle and box—introduced by  
this company, and guaranteed to outlast any other wheels  
made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

**PHELPS  
MANUFACTURING COMPANY.**

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle  
Work, Car Frames and Bolts, Machine  
Bolts, Set Screws and Tap Bolts,  
Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.  
HOT AND COLD PRESSED HEXAGONAL AND  
SQUARE NUTS, WASHERS, BOLT ENDS,  
TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

**SACRAMENTO BOILER WORKS,**

37 Fremont St., cor. Mission, S. F.

**HALL & KELSHAW,**

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks,  
Hydraulic Pipe, Oil or Water Tanks, Ore and  
Water Buckets, Gasometers, Grinders, Bridges  
and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.

Repairing promptly attended to at the  
lowest possible terms.

**GOLDEN STATE & MINERS' IRON WORKS.**

Manufacture Iron Castings and Machinery  
of all kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

**CALIFORNIA BRASS FOUNDRY,**

No. 125 First Street, Opposite Minna,  
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt  
Metal Castings, Brass Ship Work of all kinds, Spikes,  
Sheathing Nails, Rudder Braces, Hinges, Ship and Steam-  
boat Bells and Gongs of superior tone. All kinds of Cocks  
and Valves, Hydraulic Pipes and Nozzles, and Hose Coupl-  
ings and Connections of all sizes and patterns, furnished  
with dispatch.  
J. H. WEED. PRICES MODERATE. V. KINGWELL.

**California Machine Works,**  
119 BEALE STREET, SAN FRANCISCO.

**BIRCH, ARGALL & CO.,**

Builders of QUARTZ, SAW AND FLOUR MILLS,

Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORES,  
And General Machinists.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

IMPROVED PORTABLE

**Hoisting Engines,**

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery

**PACIFIC IRON WORKS,**

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,  
**RANKIN, BRAYTON & CO.,**

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY  
INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS,  
CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES,  
FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES,  
RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES,  
SUGAR MILL MACHINERY, WATER WHEELS, Etc., ALL OF THE  
LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster  
Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

**UNION IRON WORKS,**

SACRAMENTO CAL.

**ROOT, NEILSON & CO.,**

MANUFACTURERS OF

**STEAM ENGINES, BOILERS AND ALL**

Kinds of Machinery for Mining Purposes.

Flouring Mills, Saw Mills and Quartz Mills Machinery  
constructed, fitted up and repaired.

Front Street, Between N and O Streets,  
SACRAMENTO, CAL.

## Buy the Best.

Before purchasing an American  
Watch, examine the different styles  
manufactured by the HAMPDEN  
WATCH COMPANY, at Springfield,  
Mass. They are the latest and  
best improved manufacture. You  
can depend upon them for fine finish,  
durability and perfect time. They  
are sold at favorable prices—in  
fact, no higher than many of the  
inferior styles. Examine into the  
merits of this Watch before you  
buy any other. Our word for it,  
you will not regret it.

DEWEY & JORDAN, Agents,

433 Montgomery St., S. F.

To Ship and Engine Builders, Steam  
ship Companies, Etc.

A Mechanical Engineer, having an extensive experience  
in Marine Engineering (especially compound) and Iron  
Ship Building, also in Steam Engines and Machinery in  
general, is open for engagement. First-class references.  
Address and references can be obtained at office of Sci-  
entific Press.

## Machinery.

**The Ingersoll Rock Drill**

Is Extensively Used in the East and

**TAKES THE PLACE OF ALL OTHERS,**

Wherever introduced, because it can be run with less  
power, labor and repairs, and do more work than any  
other Drill in the market. It has but few parts, is easily  
handled, being light, and has AUTOMATIC FEED, which  
saves labor. WE ASK FOR TRIAL AGAINST ANY  
COMPETITOR. For particular information regarding  
Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

(Room 10,) 320 Sansome Street,

**THE O'HARRA  
CHLORIDIZING FURNACE**

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupels furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—24 Cords at \$3 per cord.....	5 25
Salt—1,000 lbs at 24 cents.....	40 00

Cost of 20 tons.....\$52 25

Cost of one ton.....2 614

In a furnace of three or four times this capacity the cost  
is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Eschequer mill, Alpine Co., Cal. For further infor-  
mation, apply to

D. J. O'HARRA,

Reno, Nevada.

**BAKER'S

EVELINA STREET, - - - PHILADELPHIA, PA

# \$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other the market, and will sell them as cheap as any other of its class.

## ENDORSED BY THE FOLLOWING PARTIES:

## The Academy of Sciences and the Lick Trust.

Judge Wheeler, of the 19th District Court has overruled the demurrer to the complaint in the case of R. S. Floyd et al., Trustees, vs. John H. Lick, administrator of James Lick, deceased. In making the decision the Judge said:

"This is a bill in equity filed by the plaintiffs, claiming to be the Trustees of certain trusts created by the late James Lick. The bill prays for a decree of this court, notifying and confirming a certain compromise alleged to have been made between the plaintiff and defendant, John H. Lick, as administrator of James Lick, deceased. The defendants embrace the surviving relatives of James Lick, as well as the respective beneficiaries named in the deed of trust. All parties in interest concur in the propriety of the compromise, except the California Academy of Sciences, which is one of the beneficiaries, and which appears and demurs to the bill.

"It is contended by defendants' counsel that the complaint itself shows that the plaintiffs are not the legally constituted Trustees, with the single exception of R. S. Floyd. To reach a satisfactory conclusion on this point, that is, whether the plaintiffs are Trustees *de jure*, involves an examination and construction of the trust deed of September 21, 1875. By that instrument, five Trustees were appointed, one of whom, the said Floyd, it is admitted, has never resigned nor been removed. By the 21st subdivision of the trust deed, it is declared, among other things, that during the lifetime of James Lick he shall be authorized to demand and receive the resignation of one or all of the Trustees and to fill all vacancies that may occur. Previous to his death the said Lick did demand in due form the resignation of all of the Trustees named in said deed, except that of the said Floyd; and a short time afterward did appoint, in due form, four new Trustees, who accepted the trusts mentioned in said deed, and who are the co-plaintiffs of the said Floyd. I think it is clear that Mr. Lick intended to reserve to himself the power to remove at pleasure any and all of the Trustees, and to appoint others to the places thus made vacant, and that consequently the plaintiffs in this case are Trustees *de jure* as well as *de facto* of the trusts created and declared by the terms of the deed.

"It is further suggested by the defendant that the complaint does not state facts showing that the adverse claim set up by the administrator has any legal force or validity. It is true that the complaint does not admit that the administrator has a good cause of action, but it avers upon various alleged grounds, claimed by the

administrator to exist, he is about to commence legal proceedings which will involve the estate in long and expensive litigation. The very term compromise involves doubt. The complaint shows that the Trustees, as well as all the beneficiaries, except the Academy of Sciences, consider it for the best interests of all concerned to carry out the compromise agreed upon. It is a fundamental rule that courts of equity are disposed to favor the compromise of contested claims. Especially is this true of charities where, upon the whole, the compromise will be more beneficial to the charity than a long and contested litigation.

"The value of the estate is alleged to be \$3,300,000. Its very magnitude furnishes the strongest incentives to a long and severe con-

and determine from what fund or funds the amount necessary to effect the compromise shall come. That is really the only question at issue. The Academy is not unwilling to compromise but it objects to giving up its entire share in order to do so. They propose that all the beneficiaries shall give up a certain percentage of each share to effect the compromise, but the Lick Trustees declare they have no right to take anything for the purpose from the specified bequests, but must take it from the balance remaining after the specified bequests are paid. The Academy and Pioneers being residuary legatees, as it were, the money is to be taken from them alone. As implied in the concluding sentence of the above decision the Court is by no means positive on this ground, and the state-

## Making Concrete Work.

We illustrate herewith the method adopted in mixing concrete for the arches and floors of the New City Hall, which was supplied by E. L. Ransome. It is the first time the mechanical mixing of concrete has been tried in this city. On the platform is one large and two small rock breakers, which are fed by four men. The platform is 18 feet high, and as the rock leaves the rock-breakers it falls on screens to a lower platform. This platform is at the upper end of a mixer, as shown, and here the rock, sand and cement are supplied in proper quantities. Eight men supply the material to the mixer. The feed is continuous. The material is mixed dry in the upper part of the mixer which is 16 feet long. The lower part contains an inch perforated pipe which, by means of a valve, supplies the necessary amount of water to the concrete. At the discharge end are five men to fill the iron wheelbarrows as rapidly as the concrete comes from the mixer, and they wheel it to the double elevator which stands by the building.

This elevator is worked by one of Hawkins & Cantrell's link-motion hoisting engines. The elevator carries two full wheelbarrows up and two empty ones down. Mr. Riley, who worked the apparatus, says they could elevate 130 barrows an hour, and he has elevated 175 in an hour, 34 feet high, to the upper floor of the City Hall. Five men were employed to take the concrete from the elevator to the corrugated iron arches.

MECHANICAL PREPARATION OF CONCRETE AT THE NEW CITY HALL.

test, and if a compromise be not effected, half a lifetime may be consumed before the numerous beneficiaries can taste the fruits designed for their immediate enjoyment by the munificence of the donor. Upon a final hearing, the court will consider, with due care, the grounds of the compromise, and will also protect by its decree the respective beneficiaries, as well as determine from what fund or funds the amount necessary to effectuate the compromise shall be drawn."

Now, although on the face of it this decision seems to be adverse to the Academy of Sciences, it is favorable to them, as it is also to the prospects of the whole matter being amicably settled. It being established that the present Board of Trustees is the proper one, that settles any doubt as to their being able to carry out the requirements of the deed without further delay. The fact that a compromise will be possible and that it is best for all parties is also established. But the important point, and the one which the Academy specially desires, is the admission by the court that this compromise is possible without it being absolutely necessary for the Academy and Pioneers to pay the amount of the compromise from their shares. The Court says it will protect the beneficiaries

ment that the respective beneficiaries will be protected in a final hearing, is sufficient basis for believing that the Judge understands the question properly, and will not see the Academy and Pioneers lose their share because the matter must be compromised. Therefore, while the decision is favorable to the more rapid settlement of the present difficulty it is also favorable to the proposition of the Academy of Sciences, that all those to be benefited by the compromise should bear their share of the expenses.

**NORTH PACIFIC COAST RAILROAD.**—The North Pacific Coast railroad was completed in May last and the first train crossed Russian river on the 21st of that month. The earnings for the five months ending September 30th, aggregated \$186,039.69, and the expenses were \$110,437.25, leaving a balance of net earnings of \$74,602.44. The road has not enough rolling stock to do its business. There are over 5,000,000 feet of lumber, 15,000 cords of wood, 2,000 cords of hark, over 100,000 sacks of potatoes and thousands of sacks of charcoal awaiting transportation. The company expects to provide greater facilities by spring, having ordered three new locomotives.

They were enabled to put in by the aid of this machinery, a yard of concrete in 20 minutes. That is, they loaded the rock in the City Hall yard, crushed and screened it, and mixed it with cement, sand and water, loaded it in the barrows, elevated, wheeled and put it in place at the rate of a yard of concrete in 20 minutes.

This was the most complete machinery for the purpose ever put up on this coast. The machinery was all made here. The hoisting engines by Hawkins & Cantrell; the portable engine that worked the crusher and mixer by H. W. Rice; the large rock breaker by Varney & Rix at the Miners' foundry, and the two small breakers by Wheeler. The mixer is new to this coast, all work of this kind having formerly been done by hand. Mr. E. L. Ransome, the contractor, made the mixer. J. W. Riley superintended the work of putting up the machinery, elevators, etc., as shown in our illustration; also the concreting of the iron arches, etc.

Experience has shown in the operation of this mixer at the New City Hall, that by its use a great saving is made over mixing by hand labor. The machine work is so thorough that it makes an equally good concrete with a much less quantity of cement.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### Notes from Tuolumne County.

EDITORS PRESS.—The 4th inst. I saw a little more of mining in Tuolumne county. Mr. P. Easton, who lives near Cherokee, has two valuable mines; one of these is a sulphur vein; from the other assays have been made at different times. One by Mr. T. C. Clark gave \$600 per ton. Mr. Bussie made three assays: the first gave \$300 per ton; the second, \$400; the third, \$500.

Mr. Easton is confident this is a very rich bank, but he has not the necessary capital to develop it.

I also visited the Fowels mine, owned by Mr. Fowels, in the same vicinity, and I saw beautiful rock which he is taking out of the shaft he is sinking, below the 50-foot level. The morning of the 5th, as I passed through Jack-souville, river mining was the only industry which attracted my attention, and, as far as I could learn, it is not very profitable this season.

I arrived in Groveland in the evening, where I was entertained by M. J. J. Dupratt, who is Superintendent of the Nonpareil mine. The next morning I visited the mines, Two Brothers, No Name and Nonpareil. The first two have given good prospects. The latter has been worked quite extensively, and promises good; and there was the nearest ten-stamp mill I ever saw. It is at the mouth of the tunnel, which saves handling the ore. The tunnel is 950 feet in length, 750 feet in a straight line, the remainder at a right angle, and forms the 340-foot level, drifting eastward and upward with a vein full three feet thick. The tunnel also cuts a parallel vein which is 24 inches in width and shows beautiful ore.

On our way back Mr. Dupratt showed me the Italian mine, which is near the others. This mine is owned by five Italians, gives a ten-stamp mill work, and is paying well. Owing to the water having failed, I could only see these mills idle, but all interested parties are waiting for the wet season to begin.

I have been over the greater part of Tuolumne county and endeavored to glean information from reliable sources. Placing that with my own judgment, I believe that this county will yet be a field in which capitalists will seek to invest their money in real mines. She has mines which are not a myth, but are those which are yielding wages to the owners, who bring the ore out in buckets and crush it in hand mortars. If it pays these poor men to thus work, who have not the means to put up the necessary machinery, will it not pay the money powers to develop these mines; and wield their capital and strength in that which is legitimate instead of gambling in stocks? Stock mining has been the curse of Tuolumne county's quartz mines. But now the people see the necessity of having their mines worked on an honest basis. There are mines in this county which are being worked in this way, and they are the ones which are paying the dividends.

The marble and limestone quarries are no small item in the wealth of this county. There are mountains of marble, and yet little progress is made. When honest stock companies are formed to bring out the hidden treasures contained in the mountains of Tuolumne county, then the working people will rejoice.

R. A. E.

### A Settlement of Charcoal Burners.

The charcoal burners of Pine Nut valley are now marketing the product of their last year's labor. They find ready sale on the Comstock range for all the coal they can produce, and at good prices. Pine Nut valley is distant from this city 35 miles, in a southeast direction. The road to the valley is said to be a very rough one, and to make a trip to this city with a four-horse team and load of coal is said to occupy four days.

During the past summer the amount of charcoal produced in the valley was from 150,000 to 200,000 bushels. This is stated to be a falling off from the product of last year.

There are at present about 80 men at work cutting wood, hauling it together and burning it into coal. In the winter more men are employed than in the summer, as it is in winter that the wood is cut. There is so little snow in the valley that it does not interfere with wood cutting. In the summer the wood is hauled, made into pits and burned.

It is said that there is an abundance of wood in that region for years to come—the groves of nut pine stretching away to the southward many miles. Only a small portion of this wood land is claimed and it is said that there is plenty of room for men who wish to go into the business of charcoal burning. The men now in the valley are anxious for an extension of the railroad in their direction. It would seem that there is a chance for men who are out of employment to find something to do in the valley in the way of cutting wood or burning coal, either for others or on their own account.—*Virginia Enterprise*.

### Meadow Lake.

A correspondent of the *Virginia Enterprise* sends the following items from Meadow Lake: Straying away from the Comstock some two weeks since, I headed for Meadow Lake. From Truckee to Webber lake by stage, then a solid ten-mile walk to the once famous mining camp, now nearly deserted. What a pitiful change from 10 years since! I was one among the thousands who came rushing in here pell-mell at a "240 gait" in 1865, and became immediately wealthy (in my imagination), and among those who a few months later, walked away from here without a cent in my pocket.

What was formerly the principal business portion of the town was destroyed by fire some four years ago, supposedly an "accident," brought about by the assistance of an uncertain "homie" resident here at the time. At present there are some 10 men here engaged in mining, that is, doing the usual work required to keep good the titles from year to year. Among those I have met there is one thoroughly practical miner, a Comstock hoy, J. A. Glenn, who is the owner of some of the best mines in the district, and, what is to his credit, knows to a dollar what the ore he has on the dump will go to the ton, and also the average of nearly every mine in the district. He is in fact, a self-taught, thoroughly practical man, and a good average assayer. He came here three years since, at the time the "Fryer process" was up to a white heat, thinking there was "millions" in Meakow Lake, provided Fryer could do one-half he talked. Having a good assayer's outfit, he set to work to ascertain what the resources of the district were. After repeated trials and "successful failures" of all sorts of processes he applied himself to working out a way to treat Meadow Lake ores in a practical manner.

The majority of the ores being low grade, a cheap mode of reduction must be had. After making repeated tests by all the different processes known, from smelting to lixiviation, he finally became convinced that thorough oxidation must first take place, then, of course, amalgamation must follow, as a part of the true process.

As a favor to me Mr. Glenn worked 10 pounds by way of demonstrating the principles he professes to operate on. The ore is first dumped on to a drying hearth, or run through a calcining furnace; from there it goes to the batteries, or a Storey pulverizer. The pulp is then treated and introduced to the oxidizing furnace, from which it is raked into wooden vats containing an alkaline bath, from which it is shoveled into improved arastras for future pulverization and amalgamation. Amalgamation has always been the stumbling block, the gold being of the character known as flour gold, being incased in a delicate film, or gas, which causes the mercury to turn away from it as if sick.

Mr. G. introduces a compound of his own invention which causes instant amalgamation, reviving the mercury and preventing flouring, working the ore up to 80%, of assay, at a cost of \$6.64 per ton. I can but pronounce the process entire a good one; practical as well as simple, and it really seems as if there must be a healthy reaction in this almost worn out district ere many months. I doubt not but many an old Meadow Laker will wish Mr. G. every success in his undertaking.

### Luck in an Old Mine.

The *Placer Herald* says: A year ago last May, Mr. S. A. Shurtliff, an energetic miner of Ophir, commenced work in an old lead on Duncan hill, to the right of the road leading from Auburn to Ophir. Of course that simple fact neither attracted attention nor created comment, but when in October following, about a year ago, he struck ore so rich that a few tons thereof yielded him \$6,000, Shurtliff's luck became the subject of most everybody's conversation. Few, however, supposed his strike was anything more than a pocket, and hence with the first sensation the matter passed off, and little has been heard or said of the result of Mr. Shurtliff's proceeding since. All in that neighborhood know he has in a modest way kept steadily at work, but outsiders not anticipating much, few have bothered themselves to become acquainted with the result. On inquiry, however, we learn from Mr. Shurtliff that from the time of his first strike all the rock taken out has paid him well. From the main shaft, which he sunk to the depth of 160 odd feet some time ago, and there rested, he has run a drift on the 105-foot level, connecting with an air shaft 75 feet distant; also on the 155-foot level he had drifted 30 feet from the main shaft each way along the lead. From the 105-foot level, and between the main shaft and the air shaft, he has stoped out the rock to within about 40 feet of the surface; he has also stoped considerably from both sides of the main shaft above the 155-foot level. The ore from these stopes indicates very thoroughly the character of the ledge to the depth he has gone, and when it is known that this ore has yielded an average of about \$40 per ton, we must conclude that the ledge, which has an average width of two feet, is a good one. But all this, encouraging as it is to the owner of the mine and the district in which the mine is situated, is not the best. Last Saturday, Mr. Shurtliff commenced work again on the main shaft, desiring to prospect his mine still deeper, and on Monday he was taking out quartz from the very bottom, not second to the best the mine

has ever produced. In color it is a dark, irregular blue, heavily sulphureted, and in some instances fairly speckled with free gold. From indications its yield will run into the hundreds of dollars per ton. This can be safely termed a good mine, as from nearly the top down it has not only prospected well, but has panned out well all the way, and the rock is richest as well as most favorable in character at the bottom. Mr. Shurtliff contemplates running a tunnel in the near future in the sides of the hill along the vein that will tap the main shaft at a depth of between 300 and 400 feet, and erecting a five stamp mill at the mouth for his own use. The mine has remunerated its owner handsomely already, but with these additional facilities for working it, at its present average yield even, the property would certainly be very valuable.

### The Bonanza Mines.

Below will be found a trial balance of the financial operations of the bonanza mines for the first three-quarters of the current fiscal year. That of the California is as follows:

Receipts.	
Bullion on hand, annual statement.....	\$1,342,967.93
Cash on hand, San Francisco, annual statement.....	1,054.56
Cash on hand, Virginia, annual statement.....	381.14
Samples on hand, Virginia, annual statement.....	2,228.68
Gross product of mine to October.....	13,963,567.07
Ore sales.....	12,704.07
Present overdraft Nevada Bank.....	975,388.80
Total.....	\$16,298,205.79

Disbursements.	
Overdraft Nevada Bank, annual statement.....	\$339,637.62
Dividends, 9th to 18th inclusive.....	10,300,000.00
Reduction of ore.....	1,694,562.50
Discount on bullion.....	707,254.43
Refining.....	144,540.77
Salaries and wages.....	558,565.00
Taxes.....	351,582.27
Supplies.....	208,874.00
Hoisting.....	132,181.79
C. & C. shaft.....	116,000.00
Legal expense.....	101,643.76
Interest and exchange.....	50,084.33
Bullion freight.....	52,640.00
Assaying.....	42,422.05
Surveying.....	900.00
San Francisco office expense.....	2,834.08
Books and stationery.....	1,156.00
Advertising and printing.....	277.00
Virginia office expense.....	2,300.73
Cash on hand in Virginia.....	1,072.71
Cash on hand in San Francisco.....	1,100.50
Samples on hand.....	1,430.72
Gold bullion on hand.....	418,698.85
Silver bullion on hand.....	651,631.70
Total.....	\$16,298,205.79

Bullion amounting to \$586,831.27 received on October account is not included in the above statement.

C. P. GORDON, Secretary.

Following is the third quarterly statement of the receipts and disbursements of the Con. Virginia mining company for the current year ending October 15, 1877:

Receipts.	
Gross product.....	\$9,469,562.40
Ore sales.....	68,201.38
Nevada Bank overdraft.....	1,300,030.11
Bullion samples.....	1,223.08
Assay.....	45,723.08
Balances last annual meeting.....	35,012.70
Hoisting.....	5,253.07
Total.....	\$16,920,006.10

Disbursements.	
Jas. G. Fair, Superintendent's acct.....	\$7,437.38
Bullion on hand unsold.....	1,434,236.61
Cash.....	2,600.20
Virginia office.....	4,192.83
Ore purchase.....	80,865.45
Freight.....	55
Survey.....	500.00
Assay office.....	20,048.84
Books and stationery.....	750.50
Legal expense.....	24,255.71
Advertising.....	146.56
Water.....	5,000.00
Real estate.....	1,652.00
Taxes.....	184,012.04
Reduction.....	1,071,709.69
Interest and exchange.....	50,084.17
Bullion freight.....	32,614.44
Dividends.....	6,480,000.00
C. & C. shaft.....	116,000.00
Bullion discount.....	900,582.03
Supplies.....	307,122.04
Salaries and wages.....	487,931.50
Expense.....	3,908.80
Total.....	\$10,920,006.10

H. W. HAYES, Secretary.

THE AMALGAMATION IMPROVEMENTS.—The experiments in amalgamation now being prosecuted at the Manhattan mill, by C. A. Stetefeldt, are not with a view to increasing the result of the process in metal, but for the purpose of reducing the time required for amalgamation. The process in use at the mill is as perfect as the best known appliances can make it, so far as yield and close working are concerned, but the aim is to effect a saving in time, labor, and wear and tear of machinery, by producing the same results in a less space of time. Mr. Stetefeldt informs us that his tests and experiments have so far progressed satisfactorily, and that he is confident of ultimately obtaining the desired result. The various departments of the Manhattan mill are at present so evenly balanced that no one of them can do more work than the other can take up and perform in regular course, and at the same time it takes all the capacity of one to keep the other supplied. Thus, the capacity of the furnace is to roast just the amount of ore that the batteries can crush, and that of the batteries is exactly equal to that of the pans. By increasing the amalgamating capacity, without adding to the number of the pans, the company would at such time as it might be necessary be enabled to put in additional stamps in the mill without the necessity of increased power to run them.—*Reese River Reville*.

### The Monterey Coal Mine.

The *Castroville Argus* says: Arrived at the head of the canyon, over a road laid with broken granite, we ascend the hill by an easy grade and reach at the top the end of the wagon road. Below, near the base of the hill, are two small buildings, one used by the men employed at the mine as a kitchen and dining-room and the other as a lodging house. We descended the hill and were very kindly received by Mr. Sherman, the gentleman in charge, who, after inviting us to an excellent lunch, to which we did full justice, conducted us through the different tunnels and gave us information upon matters generally about the mine.

The company now in charge is the second in possession, having acquired the mine at the sale of the entire property, which some of the stockholders of the first company have been threatening to contest. One of the tunnels, about 60 feet in length, was made by the old company; coal was struck here in considerable quantity, but when the new company took charge a second tunnel was cut farther down the hill, this being in length, together with the drifts, 130 feet. There is here a four-foot vein of coal of high quality, and about one-third the distance up the hill an incline has been sunk about 50 feet, through which, also, good coal has been brought up. Other smaller excavations have been made on the southerly side of the hill with similar success, and now the work of tunneling on the northerly side is going on. Should this work result satisfactorily, the coal could be sent down the canyon, over a tramroad, to the shipping point selected, a cove on the other side of and not far distant from Point Lobos, the distance from the mine being about two and one-half miles. Otherwise the coal will have to be taken up by steam power from the southerly side to the top of the hill, going forward from there over a tramroad, through the canyon.

The Monterey blacksmiths speak highly of the quality of the coal, which has been thoroughly tested by them. It is bituminous and for their purposes far superior to Mt. Diablo or Coos hay coal. The company believe the deposits are large, and therefore will push the work of development with all practicable speed.

### Murchie Mine.

The property known as the Murchie mine consists of several ledges and a hydraulic gravel claim. The ledges now being worked are the Independent and Big Blue ledges. There is a tunnel being run on the Lone Star ledge for the purpose of development, but no rock is being taken out at the present time. The property is now owned by a stock company, the Murchies retaining an interest. There is an eight-stamp mill in operation and the machinery for a ten-stamp mill on the ground, which will be put up shortly. The hoisting works are new and complete. The new company have opened up the old shafts and drifts and are now taking out rock while running on new drifts on the Independent and Big Blue and the ledges are showing equal to anything ever seen in this district. The Big Blue ledge is five feet in width and the rock is filled with heavy sulphurets and free gold and it is estimated by good judges will average at least \$25 per ton in free gold. The Independent ledge is about a foot in width and is richer than ever. It will yield \$60 per ton as has been demonstrated by several crushings. The poorest lots have paid \$49 and the highest yield was \$83 per ton. On Monday last we made a visit to the mine in company with some experienced miners, each one of whom declared that the prospects of the mine are very brilliant, and it is confidently believed that the property will, in a short time be generally regarded the best in this section. As soon as the two ledges now being worked upon are well opened; the work of development on the other ledges will be pushed ahead, and a large force of men put on. Although the Murchie mine has been under a bond, it is now giving proof of what it is worth. The success of the owners will be hailed with joy by the whole community.—*Nevada Gazette*.

THE BLACK HILLS.—The mining market is showing an improved appearance. Scarcely a day passes that we do not chronicle the sale of a mine or mill site at good figures. California capitalists have found their way into the Hills, and purchased the Home Stake No. 1, which is at present yielding 150 tons of ore per day. Eastern capitalists are also looking about for their share of the golden harvest, and, fortunately for our future prosperity, with flattering results. Not a single stamp of the 350 is idle, while many a dump groans under its load of rich quartz, waiting for a chance to make a week's run. The furnace at Bear Buttes started up a few days since, and proved a grand success, which the boys celebrated with a great ovation, and several were leaded in strict accordance with Eureka principles. The managers of the smelter pronounce the ore to be without a rebellious feature. This camp, like Deadwood, contains an unlimited amount of low grade ores. Our agricultural resources may have been overestimated in some regards. A portion of the crop has proved a failure, owing to the shortness of the season and lack of proper irrigating facilities. This last evil can, of course, be remedied, and, perhaps, when fully developed, may equal the expectations of the most sanguine.—*Eureka Sentinel*.

## MECHANICAL PROGRESS.

## American Recuperative Power.

The way in which American industry resumes its activity after great reverses is a wonder to European observers. The latest occasion for surprise in their minds is the return of railway activity after the recent serious riots in the Eastern States. The *London Colliery Guardian* gives us credit for doing what no other people could do. It says:

The Americans have an awkward fashion of drifting into labor and other difficulties, but no people have a happier knack of extricating themselves from the embarrassments to which they may be reduced in consequence. The ups and downs of American business life are certainly marvelous. It is only two months since the attention of the civilized world was devoted to a terrible conflict between labor and capital, which appeared to be shaking the commercial interests of Pennsylvania to their very center. Two months ago we were computing how many locomotives had been destroyed at Pittsburgh by mob-enkindled flames, and we were vaguely wondering who was to make good the thousands and thousands of dollars sacrificed in saturation as wild and reckless as they were senseless and unintelligible. Yet we learn that lately the Philadelphia and Reading Railroad Company has been doing something very like a roaring coal trade. Thus, in the week ending September 1st, this important company carried 178,000 tons of coal, against 64,000 tons only carried in the corresponding week of 1876. It is true that the Philadelphia and Reading Railroad was not so much a prey, in July, to mob violence as its neighbor, the Pennsylvania; nevertheless, all business interests in Pennsylvania must hang more or less together, and the rapid revival in the coal traffic of the Pennsylvania and Reading system, appears to us a marvelous circumstance, and one which would not be witnessed in any other country but the United States.

BRITISH PATENTS IN 1876.—Our London exchange, *Iron*, gives some notes of progress in the British Patent Office: During 1876 the number of applications for letters patent was 5,069, of which 1,702 were snuffed to lapse, leaving 3,367 in force after the first six months. The number of applications in 1875 was 4,561, so that there was an increase of 500, a fact unexampled in the official records. For some years there has been a steady growth, the increase of 1875 being 69, that of 1874 being 193. A calculation over all the years since the act of 1852 shows that only 28% of the patents pay the third year's fees and live for seven years, while only 10% survive the full term of 14 years by paying £50 at the end of seven years. As far as can be calculated from the statistics given, there are now, or rather were at the beginning of the year, just 14,440 patents (neglecting new and unpublished applications) in force out of the 84,114 applications since 1852. The total receipts of the Patent Office in 1876 were £185,371, of which £139,067 was profit. The patents, trade-marks and designs departments have been united. It appears that the aggregate surplus income since 1857 amounts to about a million and a half. In the Designs Registry 9,176 ornamental designs were registered, and a small number of "useful designs." The fees in this department amounted to £4,738. The Trade Marks Registry makes a first appearance in this year's report of the Commissioners of Patents. Out of the 3,698 applications lodged on behalf of 10,384 marks by the end of the year, only 261 were registered by that time, but 4,984 marks had been registered by the 31st of July. Inasmuch as by the act only those trade-marks can be protected by legal process which are actually registered, the position of the other 5,400 marks may possibly raise some nice points in future actions for infringement. The fees received on account of the Trade Marks Registry amounted to £8,295. It appears that the classified abridgements of patent specifications are again to be proceeded with.

USING BOTH ENDS OF A LATHE SCREW.—Prof. John Sweet, of the Cornell University Mechanical School, makes the following note in the *Polytechnic*: As to the wearing of the lead-screws out of pitch, this occurs from the fact that the screw is in ordinary practice used a great deal more in one part of the lathe than others. The only remedy I know of being carried out to help this is in the Ferris & Miles lathes, where they make the lead-screw reversible, so that when one end is worn they can change it. If a user of their lathe should use proper care, he might maintain a reliable screw for a long time. By always using the screw, one end for cutting standard lead-screws, and the other for indifferent work, it would then maintain its truth much longer. Were it possible to determine in advance the relative proportion of times a screw is used along the different portions of its entire length, then a method could be adopted that would maintain a uniformity of wear. If a lathe were used only one-twentieth part as much at the foot-stock end as at the head, then cutting out nine out of every ten of the threads on the screw at the foot-stock end, and so proportionately eight out of nine, seven out of eight, six out of seven, etc., down to one out of two, perhaps, bringing the wearing area of the threads into some sort of proportion with the wear that comes upon them; then there

would be at least a greater uniformity maintained than at present, if not an absolutely perfect one. But it takes a good deal of courage or faith, or something that but few men possess, to put a nicely finished perfect screw in a lathe, and turn off two-thirds or three-quarters of the thread, and convince one's self, or other people, at least, that one is doing a good thing.

TESTING HEMP-PACKED CAR WHEELS.—An interesting test by hydraulic pressure, says the *Railway World*, was recently made at the Harlem railroad machine shops, in the presence of a large number of railroad men, upon two of the Atwood steel-tire railway wheels, the peculiarity of which is that the tire is held to its place upon the center by a packing of hemp, dispensing entirely with bolts or rivets. For the purpose of experiment, a wheel which had run 40,000 miles, the tire of which showed signs of being slightly loose, was first selected. The experiment was to show that although a tire may work loose it cannot come off, the hemp packing interlocking and securing it beyond the possibility of an accident. The pressure being applied, the tire was seen to start at a pressure of three tons. The pressure being increased up to 24 1-8 tons, caused the wrought iron ring, which is simply used to cover the opening through which the packing is inserted, to spring off. When the pressure was further carried up to 50 1-5 tons it caused the tire to move off two and three-fourths inches (about half way off), but still left it firmly fixed to the center. As a second experiment, a wheel was selected which had also run 40,000 miles, in sound condition. To this a pressure of 63 7-8 tons was applied, when the tire showed indications of moving less than one-sixteenth of an inch. It was not thought necessary to carry the experiments any further, the demonstration being perfect that tires secured in this way are safe beyond all contingencies.

EFFECT OF PERCUSSION ON IRON AND STEEL.—A number of English engineers have been making tests with a view to elucidate the conditions of iron and steel when subjected to percussive strains in contradistinction to the application of steady mechanical force. Square pieces of iron and steel boiler plates were used for the purpose, the former being 7-16 inches thick, and the latter three-eighths inches, in a charge of 1½ pounds of gun cotton being used in each experiment. Each plate was laid over a basin-like cavity in the top of a large block of iron, and the gun cotton was exploded over the center, at a height of about nine inches. The result of the experiments showed that the mild steel plates of the Siemens and Bessemer processes, tempered in oil, possess an endurance and ductility far beyond what have ever characterized British wrought irons, and that steel is much superior to iron for the manufacture of boilers, locomotive tires or rails. The annealing process was shown to be clearly advantageous for steel, but so far as iron is concerned the experiments were not conclusive. It is intended that the plates upon which the experiments were made shall be subjected to a chemical analysis, and also photographed.

LIGHT IN RAILWAY CARS.—The *Railway Age* pleads for light in our railway cars, and more especially, the season of early darkness has now set in and the need of which we speak is daily growing more apparent. In those composing the suburban trains whose passengers do not take their daily ride for pleasure, but simply to reach business or home as comfortably as possible. It is now too late, to say that railway cars cannot be well lighted. In the modern Pullman cars, and in the ordinary coaches of some of our roads, lamps suspended in the ceiling, with porcelain shades or burnished reflectors, diffuse throughout a mild, clear light by which the finest type can be read with ease. In cars thus lighted cheerfulness and good humor prevail, and in reading or in animated converse the trip appears short, and the travelers leave the train with a warm and grateful feeling toward the liberal management that has done so much for their comfort. On the other hand 50 or 60 people sitting in a car lighted only by the ghastly reflection from three candles—as may be seen on several of our roads—become a silent, discontented crowd, almost dangerous to accost by the dim, irreligious light of the dip.

ELECTRIC LIGHT IN WORKSHOPS.—The *Manufacturer and Builder* gives some figures concerning the cost of employing electric light to illuminate workshops, etc. We quote a paragraph: The expense of the electric light is given as follows: The cost of a machine with lamp, giving light equal to 500 Carcel jets, is about \$450, and this will represent from 50 to 70 gas jets, according to circumstances. The power required is equal to two-horse steam power, and the cost of the carbon points, as already stated, is four cents per hour for each lamp. When the power is that of water the cost is inconsiderable, and when that of coal has to be taken into account for the steam-engine, it amounts to four cents per hour, bringing the total up to eight cents per hour, and lubrication is set down at about one-half cent more, while the wear of the machinery is regarded as nil. Taking for basis that an electric lamp only replaces the minimum number of gas jets, namely, 50, it is seven times cheaper than gas, motive power not included, and four times cheaper, taking the cost of driving as estimated above,

## SCIENTIFIC PROGRESS.

## Bees Distinguishing Colors.

In a lecture delivered by Sir John Lubbock, the well-known English naturalist, we read of some interesting experiments made to test the ability of bees to distinguish colors. He said he had taught a bee to come to a certain place for honey, and he had then placed a quantity of honey on some blue paper. He allowed the bee to come to this honey several times, and he then placed some more honey on a piece of orange-colored substance. During the absence of the bee on one occasion he took advantage of the opportunity and shifted the position of the two lots of honey. The bee came as usual to the spot where the blue paper had formerly been placed, and stood as if in doubt near the orange-colored substance, and then it dashed over to the blue paper and commenced feeding from it as usual. The lecturer said he had experimented with a variety of colors and found it always the case; if they used a bee to take honey from a certain color it would always select that color from among others. It was fortunate for them the bees enjoyed the same colors and liked the same smells as they did, as there were certain flowers that were fertilized by flies, who preferred livid yellow, dingy red, and very unpleasant smelling flowers, and they were invariably accompanied by a very disagreeable odor. Therefore, if the majority of flowers were fertilized by flies they would find that their gardens lost many of their present charms.

THE FORMATION OF VEINS.—Meunier has communicated to the French Academy of Sciences some observations on the formation of mineral veins, based on the fact that the native sulphides effect the reduction of metals from their solutions. Galena placed in a solution of chloride of gold is at once covered with gilding, and in a solution of nitrate of silver arborescent growths are formed. Other sulphides, including those which are most commonly associated in veins, iron and copper pyrites, blende, cinabar, stibene, and even the sulphide of soda found in mineral waters, produce similar effects. Nor is the action confined to the sulphides. Some selenides, antimonides, arsenides and tellurides also behave in the same way. Meunier therefore points out that if sea water, which always contains silver, filters into a vein of galena, all the silver will be reduced and concentrated in the vein, and this action explains the presence of the native silver so often found in galena. When this has taken place, and the liberated sulphur does not recombine with the silver, we have the super-sulphureted galena, sometimes so rich as to take fire in a flame. But commonly the silver is ultimately transformed into a sulphide.

NEW MINERALS.—In a most interesting communication "On Some Tellurium and Vanadium Minerals," made to the American Philosophical Society by Dr. F. A. Genth, he announces the discovery of the following new species: Magnolite, a product of the oxidation of Coloradoite, (telluride of mercury). It occurs very rarely with native mercury in the upper decomposed portion of the Keystone mine, Boulder county, Colorado, associated with quartz, limestone and psilomelane. It crystallizes in fine needles, color white, luster silky. Readily soluble in very dilute nitric acid and in hydrochloric acid. Composition, mercurous tellurate. ( $Hg_2 TeO_4$ ). Ferrotellurite occurs at Keystone mine, (as above), associated with native tellurium, tellurite and a peculiar iron sulphide, in which a part of the iron is replaced by tellurium. Composition (probably), ferrous tellurite ( $Fe TeO_4$ ). It forms a crystalline coating on quartz, resembling delicately radiating tufts, or when in cavities, very minute prismatic crystals, between straw and cream yellow, or inclining to greenish. Insoluble in ammonia, soluble in hydrochloric acid.

WHY FLOWERS HAVE DIFFERENT HOURS FOR BLOOMING.—Sir John Lubbock alludes to the fact that at certain particular hours flowers close. This habit of going to sleep is very curious, and different flowers keep different hours. The reason for it, however, is obvious, for flowers which are fertilized by moths and other night-flying insects would derive no advantage by being open by day, and on the other hand, those fertilized by bees would gain nothing by being open at night. The closing of flowers, he believes, has reference to the habits of insects, and it must be confessed that the opening and closing of flowers is gradual, and that the hours vary greatly according to circumstances.

FOUNTAINS OF NAPHTHA.—In the neighborhood of Baku, Transcaucasia, says the *English Mechanic*, there seems to be an almost endless supply of naphtha. In many cases naphtha fountains rise in summer 100 feet, and the liquid mostly flows away unutilized, as these large quantities cannot be collected. In the year 1874 there were, at Baku, 180 works in action, many of the smaller of which, however, have been stopped under the pressure of competition of the American petroleum. With better means of transport the Baku petroleum could readily compete with the American product. The largest manufactories are at Surakh Khana, where the gases streaming from the earth are used as fuel.

A DELICATE PENDULUM.—We read that there is now in operation in the laboratory of the Central University, Richmond, Ky., an interesting apparatus that records in a beautiful manner the motion of the earth in its hourly progress through space. It is the invention of Prof. T. W. Toolin. The principle upon which the instrument is formed is that a delicately constructed pendulum will continue to oscillate in the same direction as started, and preserving that plane, mark the motion of the earth beneath it. The principle was demonstrated by Foucault, a French philosopher, in 1851; was verified in Boston, at the Bunker Hill monument, and again at Yale College. The apparatus hitherto employed has been cumbersome, and the results obtained somewhat vague. The experiments, nevertheless, bear historical interest, and are related in modern text books on physics. It has devolved on Kentucky to furnish the scientific world with a finished and mathematical demonstration of the beautiful phenomenon, together with the apparatus for producing the results so as to be proved in a school room or laboratory. The instrument is about six feet high, consisting of an iron tripod and delicate pendulum. There is an index attached to the upper portion of the pendulum, and when the pendulum is started this is perfectly still. In six minutes the earth's motion becomes apparent, and the needle shows about one degree of deviation. In one hour the movement is so marked that the distance traversed by the earth may be estimated from its data. The pendulum is of such delicate construction that it will remain in motion for 12 hours, and yet may be retarded, or even stopped, by blowing upon it.

DETECTION OF ADULTERATION IN BEESWAX.—The *Druggist Circular* alludes to the fact that beeswax has been of late frequently found adulterated with resin. The usual mode of detecting the fraud is to heat the product until it begins to smoke, when the smell of resin becomes distinctly perceptible. A more accurate method is proposed by E. Schmidt, which is claimed to rapidly show the presence of even relatively small proportions of resin. About one drachm of the wax is heated in a flask with four or five times its weight of ordinary nitric acid of sp. gr. 1.31 to 1.33, until it boils, and is kept boiling for a minute; then an equal volume of cold water is added, and lastly, enough of ammonia cautiously poured in to cause the liquid to smell strongly of the reagent. The alkaline liquid is now decanted from the precipitated wax into a cylindrical vessel, and its color observed. If the wax was pure, the liquor will have a yellow color, while if the resin was present, the liquor will have a more or less intense reddish-brown color, due to the formation of nitrous compounds. This being a colorimetric test, it is well to have some perfectly pure wax for comparison. If the wax contains resin, the reaction is much more violent during the boiling with the acid. As little as one per cent. is said to be detected in this manner.

A FADING STAR.—Mr. Lockyer contributes to *Nature* a very interesting letter upon the new star in Cygnus, which shone out last November, but is now only a star of the ninth magnitude. The spectrum of the star, which at first was full of bright lines, among which lines were prominent those which characterize the chromosphere of the sun, has gradually changed, and the lines have faded out, until now but one remains. This remaining line is not one of those which were conspicuous at first, but was then relatively faint. It has held its own, however, and even brightened a little, till it survives alone. And what is remarkable is that, says the *Independent*, so far as can be judged from such measurements as are possible upon so faint a spectrum, this line is identical with the principal line in the spectrum of the nebulae. (We call attention, however, to the limitation. It is not possible on the strength of any measurements yet made to assert this identity with absolute certainty.) This, taken in connection with the rapidity with which the object hazed up and faded out, leads Mr. Lockyer to suggest that this body may not be a star at all, in the ordinary sense; but a nebulous mass, containing no great quantity of matter and at no great distance. If this hypothesis be true, however, it would seem that the star ought to have shown some sensible motion during the year.

DEAN SWIFT AS A SCIENTIFIC PROPHET.—The *Journal of Chemistry* has received the following note from Dr. Robert Reyburn, of Washington, D. C.: "In the recent accounts of the discovery of the satellites of Mars, we have not seen any reference to the curious fact of the announcement of their existence by Dean Swift in his celebrated satire of 'A Voyage to Laputa,' published in 1726. It may be found in the third chapter of this work, and reads as follows: 'They have likewise discovered two lesser stars or satellites which revolve about Mars, whereof the innermost is distant from the center of the primary planet exactly three of his diameters, and the outermost five; the former revolves in the space of 10 hours, and the latter in 21½, so that the squares of their periodical times are very near in the same proportion with the cubes of their distance from the center of Mars, which evidently shows them to be governed by the same law of gravitation that influences the other heavenly bodies.'" This was expressly written to cast ridicule upon the astronomers of his day, and now about 150 years afterwards it becomes numbered among the established facts of science.

## Tuscarora District.

We condense the following from two letters from Tuscarora, by a correspondent of the *Eureka Sentinel*:

## Tuscarora.

Is situated in the foothills of the mountains on the north side of Independence valley, a few miles from its head, and is about two and a half miles northeasterly from the old town of Tuscarora, on McCann creek, which had its inception in the placer gold mining excitement of 1866, and known at that time as the "Goose creek" excitement, owing to a mistaken idea regarding the geography of the country, the stream of that name being in a range of mountains 100 miles north of here. The town commands a fine view of the valley, and is discernible as you approach it on the Elko road from the foot of the opposite mountains. It presents the appearance noticeable in all new mining towns in districts about which an excitement like this is raging. The location is favorable. But little grading is required, and the clay, which is abundant in the suburbs, makes the best quality of bricks.

## The Mines.

The principal mines of the district, yet discovered, are located within an area of a quarter of a mile from the business portion of the town, the hoisting works of one of them, the Young America, being located at the junction of the two principal business streets. Those upon which steam hoisting works have been erected are the Grand Prize, De Frees, Silver Prize, Young America, Navajo and Hornet. Preparations are also being made for working by steam power the Golden Prize and South Navajo. The Argenta, which is owned principally by the stockholders of the Grand Prize, is worked through that company's shaft. It is supposed to be a continuation of the Grand Prize lode. In addition to the above may be named as ranking among the claims of established merit, the Grand Central, Independence, Diana, Moscow, Venture, Golden Eagle, Lida, North Central and others that I have visited, but the names of which at present escape my recollection. There are also a large number of locations in which nothing has yet been developed, but which the owners are vigorously prospecting, encouraged by the discoveries already made in their vicinity.

## The Mills.

The Grand Prize company is running two mills, one of 20 and the other of 10 stamps. They are both running exclusively upon ores from the company's mine. The new hoisting works, in the place of those which were destroyed by fire a few weeks ago, are completed, as are also the Howell rotary furnaces at the mills. Everything is working finely, and it is confidently predicted that the bullion shipments for the next month will average \$10,000 per day. The De Frees company have a four-stamp water power mill across the valley, which is doing good work, crushing the ore from the mine. The Independence mill, of 10 stamps, will be completed in two or three weeks, and will immediately commence working ore from the Independence and Navajo mines.

## Accommodations.

The greatest inconvenience experienced by a stranger upon his arrival here is the difficulty of procuring a bed. There is an excellent two-story hotel here, and more than a dozen lodging houses, but they are always full, and upon the arrival of a stage there is the tallest kind of rustling among the passengers to find a place to rest their cramped and weary limbs, and lucky indeed is he who cannot, like the Son of Man, draw an unfavorable comparison between his condition and that of the foxes of the earth and the birds of the air.

## How to get There.

There are two stage lines connecting with the Central Pacific railroad—one at Elko and the other at Battle Mountain. The fare on each is \$7.50. The stage leaves Elko about 7 o'clock in the morning, arriving here at from 3 to 5 o'clock in the afternoon. Returning, it leaves here at 7 o'clock A. M., and arrives in Elko about the middle of the afternoon. Mr. Smith Van Dreillen, whilom of the Eureka and Elko line, is the proprietor. From Battle Mountain the stage leaves at 2 o'clock P. M., and arrives here from 1 to 4 o'clock the next morning. It leaves here at midnight and reaches Battle Mountain in time for the Eastern and Western bound trains. Persons from Eureka, coming here via Battle Mountain, get through from 12 to 14 hours earlier than by the Elko route. The greater portion of the travel is, however, by night, while the Elko stages come through by daylight. Both lines are well stocked, and each one possesses advantages relatively over the other in the matter of time and comfort. In the language of the showman: "You pay your money and you take your choice."

## Altitude and Climate.

The town is situated upon an elevation of something over 7,000 feet above the level of the sea. Although but a thousand feet nearer heaven than Eureka, the difference in the density of the atmosphere is clearly perceptible. That the snow falls to a great depth in this vicinity, is evident from the natural indications as well as from the evidence of those who have sojourned here during the winter months.

## The Grand Prize.

This is the only dividend-paying mine at present in the district, although there are sev-

eral in which developments have been made, which justify the prediction that they will rank in that category in the early future. The richness, permanency and extent of the Grand Prize are no longer matters of conjecture. It is a true fissure vein, with well defined walls enclosing a ledge of from three to eight feet in width, the ore increasing in richness as depth is attained. The main shaft is down 280 feet, on a six-foot ledge of \$300 sulphure ore. The two mills of the company are kept running continuously, and it is confidently predicted that the bullion shipments for the next month will average \$10,000 per day. The mine is located on a ridge, about a quarter of a mile northeast from the business portion of the town.

## Other Prominent Mines.

The De Frees is located on the same ridge, and about 300 yards westerly from the Grand Prize. They have a good body of ore at the depth of 280 feet. The company are building a new mill of 10 stamps on the other side of the valley, and expect to extract sufficient ore to keep it running when finished. The Silver Prize is about 1,000 feet southerly from the De Frees, and is regarded by many as next to the Grand Prize, the most promising mine in the district. The incline shaft is down 160 feet, with a four-foot ledge at the bottom. They are taking out a considerable quantity of high-grade ore. They are getting down to the sulphure ore, which is of the same character as that found in the Grand Prize. The Navajo is situated on a ridge nearly half a mile westerly from the locations above named, and on the other side of the town. Their ledge incline is only down about 70 feet, from which they are drifting north and south in good ore. They have a main shaft sunk 175 feet, and at the depth of 150 feet are drifting for the ledge. Great interest is manifested in the result of their explorations, as the result will be deemed in a great measure indicative of the character and value of the locations on that mineral belt. There are probably a dozen other mines which are equally worthy of mention as those which I have briefly described, but which time and space will not permit me to specially notice.

## Conflicting Locations.

There is no chance for a newcomer to locate any mining ground upon what may be termed the Tuscarora mineral belt proper, or that section embraced within from a quarter to a half a mile from the center of the town, as it is all covered, in some instances, three or four deep with previous locations. If the ground is as valuable as it is confidently believed to be, this is bound to become a perfect paradise for lawyers. There are plenty of chances, however, for prospectors a little further off, and quite a number of promising locations have recently been made within a few miles of the town. Rock creek, about 12 miles west from here, where the Falcon claim is located, is receiving considerable attention and is believed to abound in valuable ledges.

## The People Here.

The population of the place is decidedly cosmopolitan in character. Idaho, Montana, Utah and California are well represented, and there is a fair sprinkling of tender feet from the sunrise side of the Rockies. People of nearly every nation, Missouri included, are here, and the streets present as great a variety of representative humanity as can be seen on the thoroughfares of San Francisco itself.

Fuel is scarce and proportionately high. Cottonwood and quaking aspen retail readily from \$10 to \$12, and nut pine at from \$14 to \$16 per cord. The principal fuel used at the mills and hoisting works is sage brush, for which is paid about \$3 per cord. Coal from the Rocky mountains has been brought here, but does not appear to be much used for domestic purposes.

## Conclusion.

In conclusion, I will remark that I believe Tuscarora is destined to become one of the principal mining towns in the State, and that, too, in the early future. My reasons for so believing, I have before given in this letter, but I would advise no one, and especially those seeking employment, to come here until the spring opens. There are more men here now than can find employment either in the mines or mills, or at manual labor. The winter is close upon us, and all of the signs indicate a severe season. At this altitude the snow falls to a great depth, and it is not improbable that transportation of freight will be suspended for perhaps weeks before the spring opens. It is not unreasonable to predict hard times under the circumstances. In view of these things many unemployed persons here are preparing to leave, with the intention of returning after the breaking up of winter. Let those who intend to come here to take chances, defer their visit until spring.

By the Hendy automatic concentrator, lately set to work by Purvine & Bernard, a saving of about \$20 per day over the process previously in use is effected. In addition to this there is a further saving of the wages of two men, as two men less are required now than were needed with the imperfect and expensive hand process. The Hendy concentrator is a very ingenious piece of mechanism, and to see it work is well worth the walk from town to the works in Silver Bow creek, a little over a mile distant.—*Butte (Montana) Miner*.

C. S. OSBORN is arranging to resume operations on the Pacific Sulphur Works, and has gone to work with a force of men on the mine.

## Mines about Hornitos.

The *Mariposa Gazette* says: We learn that the valuable mines in the vicinity of Hornitos, which have lain covered up and dormant for an indefinite time in the past, are really coming to the surface—developing that untiring energy and persistent will, particularly characteristic to many of the old-time miners, who, in earlier days, experienced and witnessed the valuable ores taken from the rich quartz veins in this section. They have, as we said, been persistently holding on, waiting for the gold to come forth without the application of their own physical labor, till at last, in the evening of time, these owners and holders of mines have become gray and blanched "waiting for the wagon," and have resolved to strike once more for the "root of all evil," which they have done, and are being richly rewarded for their industry and labor. Hornitos and vicinity will yet, and we predict soon, be the golden lap of Mariposa county, for it abounds with innumerable and inexhaustible rich quartz lodes sufficient to enrich a multitude of people. The late discoveries and successful developments made in the rich quartz lodes to which we have alluded is but the commencement of a new era of mining, thereby creating an impetus by which further and greater developments will soon follow, making for itself one of the best mining districts in California.

Notwithstanding the dry season has been quite unfavorable to farmers and stockmen, the mining prospects are brilliantly looming up, and appear more propitious than has been the case for many years. The McMillan mine is situated near Indian Gulch, and bids fair to become famous for its rich deposits of gold, which are daily being developed and brought to the surface. During the last two months \$6,000 have been taken out of this mine and forwarded to the mint for coinage, and, from present appearances, gold will flow freely from this mine for some time to come. This is an old mine, having been discovered by Mexicans some 20 years ago, who, by the use of mortars and arastras, took an immense amount of gold therefrom, which is well remembered and known to many of the oldest inhabitants residing in that vicinity. A tunnel of considerable length was run, giving a backing to the mine of some 30 or 40 feet, and shows a true fissure vein, averaging from five to six feet wide. Mr. A. J. McMillan is the lucky owner of this valuable mine.

## The Royal Mine.

Surnamed John S., is located a short distance north of Tuleto, an old mining camp but a short distance from the town of Indian Gulch. This mine has about 300 tons of good milling ore already out upon the dump. It is a well-defined vein, and so far the rock appears excellent. The mine has been bonded for \$25,000 for a certain length of time, with the privilege of buying. Mr. Royal is remarkable for his energy and sagacity, and is wholly devoted to the science and skill of mining for gold and silver.

## The Duncan Mine

Is located near Judge McElroy's residence on the west side of the Mariposa road, about one and a half miles from Hornitos. It is known as the old Duncan mine, worked many years since by men inexperienced in the skill of extracting gold from quartz rock, but at the same time a great amount of gold was found in pockets upon the outcroppings of the vein. Mr. Jerome B. Brown became owner of the mine some three or four years ago, and has since secured a U. S. patent thereto. He has recently, and in a brief time, taken out about \$3,000, and is energetically pushing ahead after more of the same sort. A few more pockets of like amount, and Mr. Brown will cause a first-class steam power quartz mill to be constructed and erected thereupon, one that will cause the denizens to weep with tearful joy.

## The Washington Mine

Is thundering away with its 20-stamp steam power mill—its chlorination works, its thousands of tons of ore already upon the dump, its hundreds of cords of wood piled up in regular order, and its store, hoarding-house, saloon, and, in fact, the whole town of Washington mine, which comprises two or three dozen houses, go to prove that this is a paying and thriving institution, so much so, that 10 more stamps are being added to the mill.

CARBONATE POINT.—A correspondent of the *Belmont Courier* gives a very encouraging account from the above camp. He says: The mines here are opening out splendidly. A Coffman has taken a lease on one of the mines, and with the help of one man, is taking out over three tons of ore daily, worth over \$250 per ton. There are eight men working in the mines and more men will be set to work as soon as there is room for them and sufficient teams can be got to haul the ore to Wadsworth. There are several men building houses and prospecting on their own account. The weather is so warm and pleasant that one pair of blankets are sufficient to sleep out with and be comfortable. Snow never lays here for any length of time. The Illinois mine ships about 100 tons of ore a month. There are about 40 men working in the mine and the prospects are favorable. Mining sharps (of the bonding kind) have been around here lately. They are very reticent, look wise and want to take hold. They are not apt to get hold of any paying mines, as the owners prefer selling their ore at Sacramento to selling their mines on jawbone collateral.

## Arizona Mines.

The *Arizona Enterprise* of the 13th ult. says: From Mr. Allen Cullumber we learn that Hoffler's mill in Walnut Grove started up on the 5th on a batch of 40 tons of ore from the Arhuckle mine. The next run will be on ore from the Golden Crown. The ore from this mine averages as high as \$100 per ton in gold in an arastra. The shaft is down 40 feet, and they have now commenced drifting. The outlook in this district is the brightest it has been in the last 14 years. Since the mill has started up it has infused new life into the entire district.

The Turkey creek miners are a hopeful, cheerful set of men, and now that they are at last to have a good mill in their camp, feel that fortune is about to favor them with some of her smiles, after so many frowns. We have no doubt as to the richness of the ores in that district and feel confident that the mill will not only be well supplied with custom work, but that the owners will give entire satisfaction to their customers. Mr. Masterson expects to have the mill in full operation in a very short time, when we will give our readers a detailed description of it and its workings.

Several sales have taken place within the last week or so, among which we note that of Jack Swilling's sale of the Golden Glance claim, in Black canyon district, to Peter McArdell, for the sum of \$1,750; J. P. Avery to G. Urfer & C. Osterwald 1,000 feet of the "76" lode in Humbug district, for \$300; W. R. Gillespie's sale of the McPhee, Isabella and Omega claims, in Black Canyon district, to George Opydke, for \$200; H. E. Mann has also sold to Alexander Gilmore the Palmetto and Golden Treasure claims, situated in Tiger district, for \$200.

The Sheriff's deed, conveying the ground, furnace, building, etc., belonging to the Final gold and silver mining company at Walnut Grove, was recorded on the 10th inst. The property was sold to Mr. C. B. Genung on the 1st inst., for the sum of \$1,510.

The Bank of Arizona, Treasurer of the Peck mining company, shipped by this morning's stage two bars of bullion, one of 1,474.40 oz., 919 fine, valued at \$1,751.88, and one of 1,459.70 oz., 925 fine, valued at \$1,745.80. Total weight, 2,934.10 oz., valued at \$3,497.68.

The tunnel of the Peck mine is now in over 600 feet, and the ore body shows larger and richer than ever. Mr. Bean, President of the company, yesterday showed us some large specimens of ore taken from the last car-load from the mine in the day he was there—Wednesday last. The ore we saw will go at least \$10,000 per ton, and Mr. Bean says there is plenty of it.

The Peck mine will yield at least \$100,000 per week when the work of development is so far advanced as to permit the rapid and easy extraction of the ore, and when the proper reduction works are erected. About \$18,000 gallons of water flow from the Peck tunnel every 24 hours, making a stream sufficient to supply all the machinery used at the mine, as well as what is needed for other purposes.

The black Warrior mining company have contracted with Mr. Masterson to work 40 tons of ore from their mine when the mill on Turkey creek is completed.

The revenue from the tax on the net proceeds of mines in Mohave county bids fair this present quarter to excel that of any previous quarter since the law was first enforced.

## Camp Tellurium.

Notwithstanding there is a large amount of ore pressing down the creek daily, some to the mile in this camp and some to the works in Boulder, Golden and Denver—an amount largely in excess of shipments during the past four years—there is still a marked stagnation in mining and a decrease in the amount of work for development, which plainly shows a want of capital. It is in vain that a few dollars are expended by the miner in getting down to "pay," when his "grub stake" is but the pittance saved from a few months of hard toil. His show of ore may increase in value with every foot of depth gained, and he often thinks that what he takes out ought to bring sufficient returns from the mills to pay at least something towards the expense of mining. But he is always disappointed. There is one and then another who may get a few dollars occasionally, but neither the number of miners nor dollars amount to enough for continued effort or hopeful remark. If this condition of things remains for the year to come, more than one-half the miners will be obliged to leave the mountains and find other employment, and years will be required to put a large number of mines in paying condition which ought to be paying now.

The mills in this camp continue to run regularly, and the Atchison company's mill, at the junction of Four-Mile creek and Gold Run, is likely to be in working order in the course of a few weeks. Willard's process for roasting is to be used in this mill, the experiment made at Jarestown having proved satisfactory to the Manager of the company's mill Mr. Philip.

There are not more than a dozen lodes being worked in this vicinity at this time, so far as I am able to learn, among which are the Eclipse, Vire, Paymaster, Dime and Crocus. These are not furnishing much ore for market, though all are considered to be good lodes and show what appears to be good ore. When the Atchison company's mill is ready to work, it is probable the Lincoln and the Indiana lodes will furnish ore for reduction, but they lay idle at present.—*Boulder (Col.) News*.

## Eureka Consolidated Mine.

The following is a synopsis of the President's, Superintendent's and Secretary's report for the fiscal year ending October 15th, 1877:

From the retiring President's report we take the following: The fiscal year just closed has been a most important one to the company, and its termination leaves its affairs in a most prosperous state. At the last annual meeting the company was largely in debt, and no pay bodies of ore were known in the mine. Since then valuable bodies of ore have been discovered and developed, for the extent of which I would respectfully refer you to the report of the Superintendent, and dividends paid therefrom.

From the Superintendent's report we have taken the following:

During the past year 24,968 tons of ore were extracted, 4,189 feet of drifts run, 1,685 feet of winzes sunk. The 5th, 7th, 8th and 9th levels were extended to the west line. Winzes have been sunk 200 feet below the 9th level, making a total depth of 950 feet from the surface. Large bodies of ore have been found near the west line, extending from the 5th level to the bottom of the winze below the 10th level, a distance of 900 feet on the dip of the vein, exposing an amount of ore sufficient to keep the furnaces running to their full capacity for at least a year. A large and valuable body of ore has also been developed by the Richmond on our 10th level (while the lawsuit was pending), which adds materially to the value of the property. Nearly all the ore found in the mine up to the present time has been on or near the foot wall, and no prospecting has been done toward the hanging wall, except on the 9th and 10th levels, in which I think we may reasonably expect to find valuable deposits of ore. The machinery at the mine is all in first-class order, also the furnaces.

## Secretary's Report.

## RECEIPTS.

From 1,211 tons bullion (refined).....	\$ 430,742.23

## Prospect Mountain.

The Eureka Sentinel says: In any other locality the existence of a mountain of ore, as Prospect mountain can safely be called, on whose rugged sides a pick can scarcely be struck into without striking a paying body of ore, would create an immense furor, and its possession would be heralded to the world as an endorsement of the claims of that locality for the investment of outside capital. The great drawback to its development has been the fact that almost all of the mines are owned and worked by individuals and small companies, who have been content to hold on to their locations, extracting sufficient ore in the meantime to pay expenses, and waiting patiently for the time to come when their merits would be conceded. The only instance in which outside capital has been invested on the mountain, shows what reward awaits those who have the courage to purchase. We allude to the Metamoras, a company of Chicago capitalists; and the energetic work they have expended on the mine, has been rewarded by splendid returns. The company have not only got back their original expenditures, but also have developed a large and rich body of ore, that will, while in process of extraction, place the mine in the foremost rank of bullion producing properties. The same will be the history of a hundred other mines in the same locality, whenever capital joins hands with labor to help prove their value.

One of the most important enterprises ever inaugurated in the district, and one pregnant with future results, is the Prospect mountain tunnel, a work that is being steadily carried forward by the proprietors, who have the most unlimited faith in its future importance, both as a means of proving the existence of large ore bodies in the depths of the mountain, and as an economical factor in the working of the mines already located. Very little has been written or said in regard to the enterprise, the stockholders preferring to push the work steadily without any particular heralding of its importance, content to await its completion for their reward. The tunnel is now in 370 feet, and progressing at the rate of ten feet per week.

## USEFUL INFORMATION.

## Notes on Tanning.

A writer in the *Polytechnic Review*, in the course of an article on the art of tanning skins, gives the following brief summary of the operation, which may be of value to some of our readers. He says:

Hides fresh from the slaughter house are washed, to remove blood and dirt, (if the hides be salted they must be soaked in water for 10 to 14 days,) and for this purpose a running stream is the best. The next treatment is the removal of the hair and fleshy substance, which is often preceded by a preliminary soaking of the hides in pits containing lime water (the refuse lime of the gas works, which contains sulphide of calcium, often gives good results).

The knife made use of is called the dressing knife, and the operation of dressing requires great skill on the part of the workman. To ascertain when the skins are to be removed from the lime pits, they are touched with the fingers to see if the hair still adheres. If the lime has acted sufficiently, they may be taken out and placed on the beam (so called) and the hair scraped off by means of the hairing knife. When all this has been accomplished, the ears, tail, and legs are removed and the skins washed in water containing the dung of fowls or dogs to remove all foreign substances still remaining. In this country the hides are frequently exposed for several days to foul air and sprinkled with water; after this the hair comes off with ease—this operation is termed cold sweating, and affords a larger yield of leather than any other method.

For sheep skins, treatment with bran water is very advantageous since it makes them more susceptible to the action of tanning solutions. Barley meal, spent tan, liquor and diluted sulphuric acid are likewise used. The disadvantage of the latter is that it injures the leather.

Great care should be taken not to bring the skins too rapidly in contact with the tannin, they are first immersed in a weak solution and then in a stronger. The quantity of bark employed is from four to eight times the weight of dry hides. The progress of the tanning operation is ascertained by examining from time to time a freshly cut edge of the hide, which shows the depth to which the tannic acid has penetrated. The hides are placed in a horizontal position in the pits, at the bottom of which a layer of old tan has been placed. On this are placed alternating layers of hide and fresh oak bark until the pits are nearly full. On the top layer some two feet of spent tan is placed and the pit filled with water. After being left in this position for some three months, they are taken out and replaced in other tanks. After the tanning and drying is complete, the resulting product is termed leather.

## Unlawful Forms for Business Cards.

Many complaints have reached the Treasury Department that merchants and business men, in various parts of the country, have been in the habit of printing business cards bearing such close appearance to the United States and National Bank issues that many people have been deceived thereby, and quantities of it have been passed as good money by persons who have gathered a number of these cards. Some of the samples received at the Secret Service Division at Washington are of a character to deceive even observant persons; certain samples just received, representing fractional currency and five and ten dollar notes while they bear upon their face the fact that they are not really genuine, are so very close in their imitation as to have deceived many people, and there is evidence here of one of these cards, issued by a firm in Philadelphia, without any evil intent whatever, having been passed upon a number of people. These issues are all in violation of the law, of which the persons employing such means of advertising their business seems to be ignorant. Section 5,430 of the Revised Statutes, in reference thereto, forbids the engraving or printing of anything in the impression or the likeness of any United States obligation or other security, or any part thereof, except under the authority of the Secretary of the Treasury. The penalty is a heavy fine and imprisonment. The practice, however, continues, and all because of ignorance of the law. Many indictments have been found against persons on this account, and the Department now intends to prosecute to the full extent further continuations of the business as a matter of protection to the community, the poor and more ignorant members of which are very thoroughly imposed upon.

## How to Preserve Mirrors.

It is a fact worth knowing, but which does not seem generally understood, says the *Crockery and Glass Journal*, that the amalgam of tin-foil with mercury, which is spread on glass plates to make looking-glasses, is very readily crystallized by actinic solar rays. A mirror hung up where the sun can shine on it is usually spoiled; it takes a granulated appearance familiar to housekeepers, though they may not be acquainted with its cause. In such a state the article is nearly worthless; the continuity of its surface is destroyed and it will not reflect outlines with any approach to precision. Care

should therefore be exercised in hanging. If any of our readers have mirrors which appear to be spoiling, it would be well to ascertain whether the direct sunlight strikes them. If thus exposed, they can probably be saved from further injury by simply changing their position. The back as well as the front must be protected. A small glass hung in a window, where the rays strike it behind, is peculiarly exposed. The back should always be covered where the beams are likely to touch it.

The greatest danger to looking-glasses, however, is in transporting them. Very expensive ones have been seriously injured by careless handling when merely carried across a street. The men who move furniture are seldom fully aware of these possibilities, and need to be cautioned and watched. Frequently a man or boy may be seen in the street carrying a mirror in such a way that the full glare of noon-day strikes and injures it. Owners of such articles would, as a rule, be able to keep and use them much longer if they would exercise much caution in this regard. To resilver a pier-glass often costs as much as one-fifth of the original price of the article, while the common glass is seldom worth resilvering.

It is also well to avoid hanging a mirror near a stove or fireplace, where the heat radiated can reach it. If this precaution is neglected, granulation is likely to occur, even in a comparatively dark room, by the influence of warmth instead of light. A lamp or gas jet, if placed too close while burning, though it may not crack the glass, will often bring about the same injurious crystallization, and will even sometimes cause the amalgam to melt and run off.

## CLEANSING FEATHERS OF THEIR ANIMAL OIL.

The following recipe gained a premium from the Society of Arts: Take for every gallon of clean water one pound of quicklime, mix them well together, and when the undissolved lime is precipitated in fine powder, pour off the clean lime water for use. Put the feathers to be cleaned into another tub, and add to them a quantity of clean lime water, sufficient to cover them about three inches, when well immersed and stirred about therein. The feathers, when thoroughly moistened, will sink down, and should remain in the lime water three or four days, after which the foul liquor should be separated from them by laying them in a sieve. The feathers should be afterwards well washed in clean water and dried upon nets, the meshes of which may be about the fineness of cabbage-nets. The feathers must, from time to time, be shaken on the nets, and as they get dry will fall through the meshes, and are to be collected for use. The admission of air will be serviceable in drying. The process will be completed in three weeks; and after being thus prepared, the feathers will only require to be beaten to get rid of the dust.

TEST FOR MACHINE OILS.—A German paper announces that a simple test for the presence of free acid in machine oils consists in pouring the oil to be tested over a layer of cuprous oxide contained in a glass. (The ash of the copper-smith answers the purpose, since it contains this oxide). If the oil contains either free, fatty, or resinous acid, the same will attack the oxide and color the oil green in a very short time. Slightly heating accelerates the action, which manifests itself in less than half an hour. This test is said to be very delicate and more satisfactory than any hasty test heretofore devised.

## GOOD HEALTH.

## A Tale of Consumption.

[Written for the Press by Dr. Dio Lewis.]

Thirty years ago, and while I was practicing my profession in Buffalo, N. Y., Henry S—, a slight, pale, young man, presented himself one morning, and asked me to examine his lungs. The examination over, he scanned my face with eager solicitude, and in a trembling voice, said: "Nothing there but a little bronchitis or something of that sort, is there?"

I did not reply at once, and during the silence it was painful to watch his face. I asked:

"Are your parents living?"

"No, they are both dead. My mother died when I was six weeks old, and they say she died of exhaustion. My father died of bronchitis. The doctors pronounced it a complication of dyspepsia and bronchitis, but they all agreed there was no consumption about it. And I might as well tell you that I had a sister, and she is dead. Her malady the physician called *marasmus*. So you see there is no consumption in the blood. I don't know as there was any use in my troubling you with my little ailments. I should soon be all right again of course, but I have a friend who is sort of fidgety about me, and I promised her that I would drop in sometime, when I happened to be passing your office."

Poor fellow! my heart ached for him. I suppose that during my 35 years of medical experience, I have met a thousand victims of consumption, who, like this young man, tried to shut their eyes so that they should not see. I resolved to be honest with him, and as tenderly as possible I said:

"I am sorry you are trying to deceive yourself. You must learn the truth soon; why not see it now while there is time to do something. You are probably mistaken about the malady of your parents, and sister, but nothing can be more certain than that you have genuine consumption. You seem to be a person of spirit and courage. If I am right it is, perhaps, not too late to turn aside the shaft. At any rate the only chance of escape lies in clearly comprehending the danger, and, with your eyes wide open, boldly meeting it."

I may here inform the reader that he gave me the name of the physician who had attended his parents, and I wrote for information. The family doctor assured me that both parents died of tubercular consumption, and the sister, he presumed, died of the same malady.

I advised my patient to take a vacation, and come to see me daily. On the following morning he brought with him a pretty, modest girl, who told me, with many blushes, that she had a right to be interested in everything that concerned Harry. He had not told her my opinion of his case, but had brought her to hear from me the dreadful news. It has been very rare in my experience to witness anything so touching as her grief when I told her that her friend had the consumption.

"Is there no hope?" she cried. When I said, "there is still hope, if certain things can be done," she replied, with startling energy: "It can be done! It shall be done! No matter what it is! Nothing shall stand in the way!"

It does not matter what our discussions were; it does not matter that many difficulties sprung up; it only remains to inform the reader that within a few days two saddle horses were purchased, the young woman's hair cut short, two suits of corduroys obtained, and what seemed two young men, with saddle bags stuffed with good flannels, left Buffalo for Virginia and the South. I need not tell you how a pulse of 95 came down to 75 in 10 weeks, nor how while riding through northern Georgia and Alabama these two travelers often came from 20 to 30 miles a day; nor how when they came up the Mississippi valley the next spring, they were obliged to add two ponies to their riding stock, as their daily distances had become too great for their animals; nor how when they arrived in Buffalo, after an absence of 8 months and 21 days, having ridden on horseback about 4,300 miles, they were the brownest and roughest and toughest young chaps you ever saw; nor how one of the young men, with the assistance of old friends, was transformed into a bride with a stunning veil; nor how the two devoted travelers insisted upon sitting for the ceremony on the same horses that bore them away to health and happiness nine months before; nor how the horses were bedecked with flowers and petted as if they were parties to the new relation.

I could tell you about these things, and many more which would enhance the interest of the story, but this is not my purpose.

What I will state is, that Henry S— and his faithful wife kept up, under my exhortations, a daily ride of 10 to 15 miles, and at length came to believe, as firmly as I did and as I do, that the case of consumption must be desperate that can resist a year of life in the saddle.

RUSSIAN REMEDY FOR HYDROPHOBIA.—A correspondent in *Land and Water* gives the following Russian remedy for hydrophobia: In Saratov the inhabitants collect the larva of the rose beetle (*Cetonia aurata*) which are chiefly found in the wood-ants' nests. The grubs are gathered in the spring, placed in earth and their change of metamorphosis watched for. When this takes place, they kill the beetles and dry them. The powdered insect must be kept in hermetically sealed bottles, or the dried beetles may be kept in sealed pots and reduced to powder when wanted. Three beetles, powdered, is considered a dose for an adult given immediately after the bite. One for a child and five for an adult in which the disease has declared itself. The effect is to produce a long sleep, which must not be interrupted. The bite is also treated surgically. The beetles caught on flowers are not so beneficial; they must be secured in the larva stage and killed directly after they attain the imago. Some of the Russians give their dogs occasionally half a beetle as a preventive.

POISON IN WALL PAPER.—The investigation of this subject continues among the analysts. The *English Mechanic* says that 50 samples of wall paper recently examined were found to contain arsenic either as arsenic or aceto-arsenite of copper. Some papers with green figures were found to be free from arsenic, while, as a rule, the higher-priced qualities contained the poison in the largest quantities. A room of the moderate dimensions of 15 feet square and 9 feet high would be covered, if these papers were used, with "ornamental" surfaces containing from 52 grains to more than eight ounces of poisonous matter.

DEATH FROM CHLOROFORM AVERTED.—A correspondent of the *British Medical Journal*, communicates the interesting observation, that in a case of syncope during the administration of chloroform, where the usual treatment was without effect, and death seemed imminent, the application of some lint saturated with nitrite of amyl to the nostrils was followed almost immediately by restoration of the pulse, and the subsequent recovery of the patient.

Large advertisements at favorable rates. Special or  
reading notices, legal advertisements, notices appearing  
in extraordinary type or in particular parts of the paper,  
inserted at special rates.

Four insertions are rated in a month.  
Subscription in ADVANCE—Postage paid—one year, \$4;  
six months, \$2.25; three months, \$1.25. Remittances by  
registered letters or P. O. orders at our risk.

THE ORIGINAL ARTICLES in this paper are mostly set in  
solid type, giving in our columns one-third more reading  
than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual  
members, or others, who may at any time be absent.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, Nov. 3, 1877.

## TABLE OF CONTENTS.

**GENERAL EDITORIALS.**—The Academy of  
Sciences and the Lick Trust; Making Concrete Work,  
273. Increase of Temperature with Depth; The Patent  
Office; An Arizona Bonanza; The Mining Share  
Market, 280. Hydraulic Mining in California, No. 4,  
281. The Philosophy of the Handy Concentrators,  
284. Notices of Recent Patents; Patents and Inven-  
tions; New Incorporations, 285.

**ILLUSTRATIONS.**—Mechanical Preparation of Con-  
crete at the New City Hall, 273. Diagram Showing the  
General Arrangement of Tail Sluices and Undercurrents  
at the North Bloomfield Tunnel, 281.

**CORRESPONDENCE.**—Notes from Tuolumne  
County, 262.

**MECHANICAL PROGRESS.**—American Recuper-  
ative Power; British Patents in 1876; Using Both Ends  
of a Lathe Screw; Testing Hemp-Packed Car Wheels;  
Effect of Percussion on Iron and Steel; Light in Rail-  
way Cars; Electric Light in Workshops, 275.

**SCIENTIFIC PROGRESS.**—Bees Distinguishing  
Colors; The Formation of Veins; New Minerals; Why  
Flowers have Different Hours for Blooming; Fountains  
of Naphtha; A Delicate Pendulum; Detection of Adul-  
teration in Beeswax; A Fading Star; Dean Swift as a  
Scientific Prophet, 275.

**USEFUL INFORMATION.**—Notes on Tanning;  
Unlawful Forms for Business Cards; How to Preserve  
Mirrors; Cleansing Feathers of their Animal Oil; Test  
for Machine Oils, 279.

**MINING SUMMARY** from the various counties  
of California, Nevada, Arizona, Colorado and Idaho,  
277.

**MINING STOCK MARKET.**—Sales at the San  
Francisco, Pacific and California Stock Boards; Notices  
of Assessments, Meetings and Dividends, 276.

**GOOD HEALTH.**—A Tale of Consumption; Russian  
Remedy for Hydrophobia; Poison in Wall Paper; Death  
from Chloroform Averted, 279.

**MISCELLANEOUS.**—A Settlement of Charcoal Burn-  
ers; Meadow Lake; Luck in an Old Mine; The Bonanza  
Mines; The Amalgamation Improvements; The Monte-  
re Coal Mine; The Murchie Mine; The Black Hills,  
274. Tuscarora District; Mines about Hornitos; Car-  
bonate Point; Arizona Mines; Camp Teulium, 268.  
Eureka Consolidated Mine; Prospect Mountain, 279.  
Meat Packing and Compressing; Sale of the San Juan  
Mines, 283.

**GENERAL NEWS ITEMS** on page 285 and other  
pages.

**SILVER LAKE DISTRICT.**—Those who are fully  
competent to judge declare the ores of the Sil-  
ver Lake district to be less difficult to work  
than any other silver ores of Montana. The  
country rock is dolomite lime, and the gangue  
carbonate of baryta. The ore found in this  
matrix is so easily amalgamated that it is worked  
to 95 per cent. of its assay value by milling  
process, anything but elaborate. We are per-  
mitted to make the following extract from a  
letter lately received by Wm. Purvine from one  
of the owners of the lode discovered but a short  
time ago in Silver Lake district: "We made a  
clean-up last week of 1,300 ounces of silver from  
a run from our new mine. The ore mills fully as  
well as the ore from the Silver Moss, although not  
quite so rich. We are working one shift of  
two men on the Silver Moss, and it is looking  
well. The mines of this district never looked  
so well as now."—Butte Miner.

**THE CHANNEL TUNNEL.**—Operations con-  
nected with the submarine tunnel have already  
been commenced on the French side of the  
channel, several pits having been sunk to a  
depth of about 110 yards. At the same time  
the French and English committees have defi-  
nitely drawn up the conditions of working for  
the route. The property of the tunnel is to be  
divided in half by the length—that is to say,  
each company will possess half of the line,  
reckoning the distance from coast to coast at  
low tide. Each company will cover the expenses  
of its portion. The tunnel will belong to its  
founders. At the expiration of 30 years the  
two governments will be able to take possession  
of the tunnel upon certain conditions.

**GOLD AND PASSENGERS FROM SITKA.**—The  
steamship *California* arrived from Sitka on  
Thursday, bringing 100 passengers, and \$110,-  
000 in gold dust.

## Increase of Temperature with Depth.

A point connected with deep mining which  
has been much disputed is that relative to  
the increase of temperature with depth. The  
varying results attained by different experi-  
ments lead to the conviction that there is no  
fixed rule applicable to all localities and all  
classes of rock. That the rocks increase in  
temperature there is of course no doubt; but in  
what ratio this increase occurs is still a matter  
open for discussion. For the first 50 or 60 feet  
there is no perceptible increase; after that the  
increase of temperature becomes noticeable as  
depth is attained. But whether it is in the  
ratio of one degree for every 45 feet or one de-  
gree for every 73 feet is a disputed question,  
and the figure has been placed all the way be-  
tween these numbers.

The first persons to make systematic obser-  
vations and experiments on this question were  
Mr. Henwood, in Cornwall and Mr. Reich in  
Saxony. In a recent lecture before the Royal  
School of Mines, Prof. Smyth stated that the  
general average results of Reich's observation  
was that the depth corresponding with an in-  
crease in temperature of 1° Fah. was 76.26 feet.  
Mr. Henwood's experiments, and the lecturer's  
own experience, give the depth about 60 feet.  
The observations of Prof. J. Phillips at Monk-  
wearmouth colliery, gave 59.36 feet. The very  
careful experiments made by Mr. Bryham, dur-  
ing the sinking of the Rosebridge collieries (the  
deepest in England) where holes were bored to  
a depth of 3 feet into the rock at the sides and  
thermometers placed in and tamped, and al-  
lowed to remain for a time, gave as a general  
result in the lower part of the workings 51 feet  
for 1° Fah. In the Grenelle bore-hole the ob-  
servations presided over by Arago and other  
careful observers, gave the depth at 60 feet.  
At the deep holes at Creuzot, M. Malfredin  
found at one bore hole 56 feet, and in another  
43.1 feet. The latter, however, he supposes to  
be vitiated by the heat due to the friction of  
the borer, and we must also, in the bore-holes  
filled with water, remember that any heat in the  
lower part will cause upward currents in the  
water, and tend to equalize the temperature of  
the various parts. In the deep Prussian bore-  
hole at a depth of 4,040 feet the temperature is  
given at 38.5° Reaumur, which would give for  
1° Fah. a depth of 67 feet. Abnormal condi-  
tions will occasionally alter these rates consid-  
erably. At a depth below the surface of 30 to  
50 feet the temperature of the ground will be  
found to be invariable, and just equal to the  
mean annual temperature of the locality; hence,  
going down on a cold day, it appears to be  
warm, while on a hot day the air underground  
appears to be cool.

It is supposed by some that at a depth of  
2,000 feet the average rate of increase will  
decrease from what it was above. In a recent  
paper by Walter Rowley on "Deep Mining  
and Recent Engineering Achievements or  
Connections Therewith," published in the  
*Colliery Guardian*, he stated that this opinion  
is supported by the evidence of Monsieur  
Lambert, Government Inspector of mines  
for Belgium, who says that at the Simon  
Lambert colliery, at a depth of 3,489 feet, the  
temperature was only 78°, or an increase of 1° in  
119 feet. Calculations made in accordance with  
this hypothesis give the results tabulated below:

At 60 Feet Temperature=50° CONSTANT.						
From	Feet	Temp.	Feet	Temp.	Feet	Temp.
50 to 2,000	increase of	1	in 68	= 78	at 2,000	
2,000 "	4,000 "	1	" 75	= 104 "	4,000 "	
4,000 "	6,000 "	1	" 80	= 129 "	6,000 "	
6,000 "	8,000 "	1	" 85	= 152 "	8,000 "	
8,000 "	10,000 "	1	" 90	= 174 "	10,000 "	

If these conclusions turn out to be correct,  
the normal temperature at 4,000 feet will be  
about 104°, and about 152° at 8,000 feet. It  
may be possible to reduce the temperature at  
such an extent as to secure adequate ventilation  
at these great depths. Experiments made at  
Rosebridge colliery (the deepest in England) to  
a depth of 2,400 feet, as well as many on the  
continent, support this opinion. The normal  
temperature of the coal at the above colliery is  
93°, whereas the temperature is reduced at the  
face of the workings, to an amount varying from  
77° to 63°, according to the length of time  
exposed.

## The Patent Office.

A cotemporary, in a paragraph stating that  
the Patent Office at Washington is again in run-  
ning order after the late fire, says: "The Com-  
missioners have not attempted to maintain that  
the Government can avoid its responsibility to  
make good the losses of patentees, but they ask  
that these patentees shall restore, at their own  
expense, such models as were destroyed, believ-  
ing that it is to the advantage of the patentees  
to take upon themselves the restoration of the  
models, especially as they will thereby have the  
privilege of remedying defects and illustrating  
improvements discovered since the originals  
were patented."

This long sentence, apparently elaborated with  
care, conveys an entirely erroneous impression,  
and is calculated to lead inventors astray. Pa-  
pers which attempt to give information sup-  
posed to be of value to the inventors of the  
country, should be careful of their assertions,

but we notice that in nine cases out of ten, such  
items are incorrect.

The truth is the Government simply stated  
that those inventors who desire to do so may  
restore their models to the Patent Office. There  
is no obligation to do so; but it is supposed that  
inventors will take the opportunity offered to  
replace their models. It is a guarantee of the  
authenticity of the patent, but inventors may  
exercise their own judgment as to whether they  
will stand the expense or not.

The concluding lines of the paragraph  
quoted above, are entirely wrong. It is foolish  
to suppose that inventors could be al-  
lowed "to remedy defects and illustrate im-  
provements" in their models. The models  
would have to be exactly as they were at first;  
that is, they would have to show the invention  
exactly as it was at the time the particular patent  
was granted. Any one at all familiar with  
patent matters would not have made such an  
assertion, which is foolish on the face of it.

## An Arizona Bonanza.

One of the richest and most extensive exhibi-  
tions of ore ever shown in San Francisco is now  
on exhibition at 405½ California street. The ore  
is from the celebrated Stonewall Jackson mine, of  
Globe district, Arizona, some 150 miles north-  
easterly from Tucson, and near the surveyed route  
of the 32d parallel railroad. This mine was re-  
cently sold by its original owners to San Fran-  
cisco capitalists for \$120,000 cash. But little  
work was done upon the mine until since the  
above sale, and, in fact, but little has been done  
up to the present time. The ore now on exhibi-  
tion—6,800 pounds, a little short of three and  
one-half tons—is estimated to be worth \$19,000  
per ton, or an aggregate of \$65,550. The ore,  
as will be seen by inspection, is literally full of  
metallic silver—the metal forming 60% or 70%  
of the entire weight. The only other form,  
aside from native, in which the silver appears  
is as a chloride, of which there is a large quan-  
tity. This ore was selected from a lot of about  
10 tons, which was taken from the shaft and  
drifts, as seen in the accompanying diagram.

By reference to the above diagram, which  
represents the actual work done in the mine, at  
the time this ore was shipped, it will be seen  
that the ten tons were taken from a shaft 92  
feet in depth, on the vein, which, with the  
drifts, aggregate 300 running feet. This is a  
very small amount of ground from which to  
obtain such results. The work at the same time  
proves very conclusively the value of quite an  
extent of ground above, and in near proximity  
beyond and below the drifts. Of course no one,  
however experienced, can do anything but guess  
at the continuance and richness of the vein.  
But its great uniformity over so much space, as  
prospected, with no evidence of "pockets" or  
"deposits" furnishes very good evidence of its  
continuance both in extent on the line of the  
vein and in depth.

The vein is very narrow, but never, so far,  
found broken, and varies from three to nine  
inches in thickness. The ore came up in iron-  
strapped boxes. A force of men are still ac-  
tively at work in the drifts, and as soon as a  
connection can be made between the 55-foot  
gallery and the tunnel which is approaching  
from the bottom of the hill, to give air to the  
shaft, men will be set to work sinking the shaft  
still deeper. The parties owning the mine will  
prosecute the work of development as rapidly  
as room can be found for men to work. The  
principal owners are C. H. McDermott, Michael  
Tierney and J. M. Martin—the latter a resident  
of Santa Rosa. The Superintendent and the  
gentleman now in charge of the ore on exhibi-  
tion is Mr. H. S. Jacobs. This display will  
no doubt add much to the already high estimate  
which is placed upon Arizona as a mining  
region. We hope the fortunate owners of the  
Stonewall Jackson may, in the early future,  
as present appearances indicate they will, de-  
velop a bonanza equal or superior in value to  
that of world-wide celebrity which is now being  
worked on the Comstock.

**BULLION SHIPMENTS.**—Since our last issue  
shipments of bullion from the prominent mines  
have been as follows: Martin White, October  
20th, \$14,285.47; Raymond & Ely, 22d, \$10,-  
095.90; Con. Virginia, 24th, \$190,649.87; Cali-  
fornia, 24th, \$194,278.27; Manhattan, 25th,  
\$11,339.90; Standard, 25th, \$40,162.33; North-  
ern Belle, 25th, \$4,963.27; Day, 26th, \$10,-  
512.00; Modoc, 26th, \$3,727.60; Con. Virginia,  
27th, \$113,768.32; California, 27th, \$199,941.70;  
Grand Prize, 27th, \$14,500.00; Endowment,  
27th, \$2,352.57; Arizona, 27th, \$1,908.46;  
Northern Belle, 28th, \$3,653.36; Leopard, 29th,  
\$4,400.00; Alps, 29th, \$1,835.00; Grand Prize,  
31st, \$17,000.00. Gold Hill, October shipments,  
\$11,500.00.

The Manhattan company will, after this date,  
charge, for reducing ores, \$35 per ton, allowing  
in bullion 80% on ores, the assay value of which  
is \$400 per ton or less, and 52% on ore of a  
higher grade.

## The Mining Share Market.

The past week has been a disastrous one to  
holders of mining stocks. In the face of un-  
usually favorable news from the mines, the  
prospect for a good crop year, the revival of  
general business in this city and the abundant  
supply of capital at the banks, the stock market  
has made one of those unaccountable and un-  
avoidable plunges toward bedrock which have  
been so disagreeably frequent during the past  
year. Public confidence has been so completely  
undermined by the recent policy of stock mag-  
nates that at the least symptom of a decline  
there is always the same precipitate rush to sell  
at any sacrifice. In this case, the slow and  
steady decline of the preceding week was  
changed into a veritable panic by the hursting  
of the pool on Exchequer and Bullion. These  
stocks were dumped upon the market in quan-  
tities which it was impossible to absorb; sales of  
Exchequer in the San Francisco Board alone on  
Wednesday, reaching over 25,000 shares. The  
market for some time has hinged upon these  
and the other stocks controlled by the Schultz  
management, and the terrible break of nearly  
75% in the leading speculations carried the val-  
ues of all other stocks down in sympathy. There  
is little doubt that the pool movement has been  
altogether a losing operation to those who were  
engaged in it, but then that is small consolation  
to the hundreds of lesser shareholders who have  
been ruined by the panic. An attempt had  
been made to uphold the prices of Exchequer  
and Bullion at a point which the mining and  
speculative prospects did not warrant. After  
forcing quotations to a tolerably high figure it  
was found impossible to unload more than a  
certain percentage upon the public, and the  
bears, taking advantage of the situation, broke  
in upon the pool and utterly routed it, bringing  
at the same time disaster to the whole list of  
mining securities. All the Comstocks suffered  
severely, those of the south and particularly so;  
while of the north end stocks Con. Virginia ex-  
hibited alarming symptoms of interest. The  
outside stocks sympathized in the decline to a  
certain extent, but not in proportion to Comstock  
shares. Toward the close of the week a slight  
reaction has set in, but quotations have by no  
means recovered their status of a fortnight ago.  
The main hope of the bull party is in the fact  
that the market, in two or three of the more ac-  
tive stocks, has been heavily over-sold. The  
attempts of the bears to fill their short con-  
tracts may have the effect of putting a better  
face on matters, even though the improvement  
be but temporary.

Meanwhile the great work of developing the  
mineral resources of the coast goes steadily on,  
without regard to the vicissitudes of the market  
or the unfavorable auguries presented in Mr.  
Del Mar's special report to the Silver Commis-  
sion. Active prospecting is being carried on at  
more points on the Comstock than ever before,  
and prospects in several instances are encour-  
aging. A new departure has been made by the  
Crown Point company in returning to the old  
abandoned upper levels and prospecting them  
at places long ago given up as offering no prom-  
ise of ore. The search has been rewarded by  
the uncovering of a large deposit of low grade  
ore, and in the Belcher and other neighboring  
mines the same policy is about to be introduced.  
The Savage and Hale & Norcross are at last  
sensibly gaining on the water. The great  
bonanza looks as well as ever, and the outside  
districts are promising well. There is, there-  
fore, no cause for the decline in the value of  
shares except that people have lost all confi-  
dence in the ability of the market to completely  
recuperate. Some time, of course, there may  
be a repetition of old-time activity, but not un-  
til a different disposition prevails.

**NEW FURNACES.**—A correspondent of the  
*Salt Lake Tribune*, writing from Sandy district,  
says: Wm. Tudingham has completed the  
erection of two new and substantial furnaces  
for the Mingo smelting company, which will be  
in running order by the first of November at  
farthest. In a short time he is to engage in the  
building of two large roasters, under the im-  
mediate supervision of Mr. Knapp, the Superin-  
tendent. Then two new stacks added to the  
two so successfully running for the last year,  
will keep Sandy floating through the present  
stagnation successfully. I am credibly informed  
that the Mingo company, on account of the low  
price of lead, have been compelled to make a  
reduction in the wages of their men. Furnace  
men are reduced 50 cents, feeders 75 cents, and  
helpers 25 cents. Outside labor is continued at  
the same rate, \$2 per day. Though this cutting  
has affected some, yet the public will see that  
the Mingo company have used good judgment,  
and studied well the laborers' interest by not  
reducing him any. A man cannot support a  
family and clothe them for less than \$2 per day.  
Other companies think differently, as they have  
already given them the lash to \$1.75. Compa-  
nies should be cautious in compelling men to  
work at starving rates.

A LARGE tract of rich oil land was discovered  
last week about 12 miles northwest from San  
Buenaventura, and already 8,000 acres have  
been located by the citizens. Green oil of ex-  
cellent quality is found in large springs. The  
owners will at once start two or three prospect-  
ing wells.

## HYDRAULIC MINING IN CALIFORNIA.\*

No. 4.

[By Ato. J. BOWEN, Jr., A. B., Mining Engineer.]

## Riffles

Square blocks of suitable length and breadth, eight to 12 inches deep, called riffles, arranged with spaces of one to one and a half inches between each cross row, are used to line the bottom of the sluices. They are held in position by small boards one and a half by six inches, fastened crosswise on the bottom between the rows by means of headless nails, and made secure by a cleat one and a half by three inches, nailed longitudinally on top of the blocks on both sides of the sluice. This method of setting riffles is falling somewhat into disuse. Block riffles are now frequently set and held firm in position by means of soft pine wedges driven between the blocks and the sides of the sluice. When wedges are used it is necessary that the sides of the blocks should be square where they adjoin one another. A side lining is required in all sluices. In cement claims, blocks four inches thick 18x24 inches in size are used for side lining.

In many localities round stones, instead of blocks, are used for riffles, and where heavy cement is washed these are considered preferable on account of their cheapness. At Smartsville they have been found to serve fully as well as the blocks, and are claimed to be cheaper. It must, however, be stated that they are more costly to handle, as longer time is required to clean up and repave the sluices when they are used. In some sections of the State longitudinal riffles are preferred, i. e., riffles made of scantling placed lengthwise in the sluice. It is frequently the case that the several kinds of riffles are used in long sluices. Where the banks contain many large boulders, as at the Paragon mine, a different style of riffle has been introduced. These riffles are made of 6-inch scantling, one and one-half inches wide, eight feet long, separated by blocks one and one-half inches wide, and an iron bar one and one-half inches wide, one inch deep, and eight feet long, is fastened on top of each scantling. The grade of these sluices is 18 inches per 12

feet lower end. Riffles, 1 by 4 inches lumber, covered with strap iron, rails 1 inch apart.

## Loss of Quicksilver.

In hydraulic mining a loss of quicksilver cannot be avoided, the amount lost depending on the character of the gravel washed, the quantity of water used, the grade, length, and condition of the sluices, and on the number of days run. The use of a long line of sluices, kept in good order, and the employment of undercurrents, tend to diminish it.

The aggregate amount of quicksilver lost at the La Grange hydraulic company's mines during a period of two and one-half years in running six claims, 1,520 days (24 hours), washing and moving 2,275,967 cubic yards of gravel, and using 1,533,728 inches of water (2,159 cubic feet each), amounted to 553.75 lbs. quicksilver. The North Bloomfield claims for the year ending November 3, 1875, used 464,600 miner's inches of water, and 9,649 lbs. of quicksilver were employed in the sluices. The loss of quicksilver at the respective claims was as follows:

Name of Claim.	Miner's in. used.	Length of Sluice, Feet.	Loss of Quicksilver, Lbs.	Per cent.
No. 8.....	380,972	1,500	900	11
Woodward.....	51,556	400	217	25
Eisenbeck.....	20,000	400	125	25

The losses at the Woodward and Eisenbeck claims are attributed to old and poor sluices and steep grade. For the year ending October 31, 1876, the loss of quicksilver at the above mentioned claims was as follows:

Name of Claim.	Miner's in. used.	Length of Sluice, Feet.	Loss of Quicksilver, Lbs.	Per cent.
No. 8.....	700,000	1,800	2,251	
Woodward.....	36,000	600	123	
Eisenbeck.....	56,300	400	182	

## The Loss of Gold.

The loss of quicksilver would seem to involve a loss in gold, but it is practically impossible to determine to what extent this is the case. There are many conflicting opinions as to the amount of fine floured and "rust" gold lost in hydraulic mining, but in properly constructed sluices the already known appliances, when used, save all that can at present be economically and profitably caught.

The third undercurrent was 91 feet distant from the second undercurrent, with a drop of 50 feet between them. Its yield was nearly \$500.\*

It sometimes happens that 100 or 150 feet at the head of a sluice are covered with gravel during the greater part of a run. In such cases the gold is found so much further down the sluices. In the North Bloomfield tunnel, the upper 300 feet of the sluice is generally filled with gravel, from one to five feet deep, and still this portion yields much more amalgam per linear foot than the next 300 feet of the sluice below.

From the report of this company for the year ending October 31st, 1876, the following data and facts are worthy of note, as showing the position of the gold as cleaned up in the sluices at No. 8 claim, where some 700,000 inches of water were run, washing 2,919,000 cubic yards of gravel.

Sample.	Yield of sluices, \$	Per cent. of gross yield.
Flume (1,800 feet).....	170,900 73	92.66
Tunnel below flume.....	7,200 00	3.75
Tail sluice (300 feet).....	1,300 00	.95
Undercurrents.....	5,235 00	2.50
	\$162,735 73	100.00

## The Distribution of Gold in Tail Sluices.

The North Bloomfield tunnel (8,000 feet in length) has 1,800 feet of sluices, paved with blocks, at its upper end, but in the succeeding 6,200 feet no sluices are used, the tailings being allowed to run on the bare bedrock (a tough slate).

From the rock cut at the mouth of the tunnel a sluice paved with rock receives the tailings. From here on they are carried through sluices and cuts, distributing them over undercurrents set on different grades, paved in some instances with rocks and blocks, and occasionally arranged with longitudinal riffles covered with strap iron.

The grizzlies used are made of wrought iron, one by four inches in size, set on edge.

The discharge from the several undercurrents is taken up by the main sluice, and subsequently discharged over the succeeding undercurrents, till the lowest sluice and undercurrent finally discharge the tailings into the canyon. From Dec. 1st, 1876, to June 1st, 1877, 350,000 24-

A yielded	Oz. amalgam	
B " "	5	
C " "	8 1/2	1 clean up
D " "	5	
Chute yielded	6 1/2	
Total.....	25 oz.	\$150

No. 6 Undercurrent.—Size, 24 by 30 feet; grade, 17 inches to 12 feet; rock riffles; chute, 2 1/2 feet upper end, 2 feet lower end. 150,000 miner's inches of water.

A yielded	Oz. amalgam	
B " "	8	
C " "	5	1 clean up.
D " "	3 1/2	
Chute yielded	3	
Total.....	19 1/2 oz.	\$115

The total yield of the undercurrents and tail sluices for the period mentioned was \$7,872, whilst the total yield of the claims was \$145,000.

The amalgam from the main sluice is worth from \$7.50 to \$8.50 per ounce, whereas that of the undercurrents varies from \$6 to 6.20 per ounce. The following statement shows the result of the of the undercurrents and tail sluice clean ups for the year 1876-7.

Cut A to B.....	Oz. amalgam.
Tail sluice B to C.....	1364
Undercurrent No. 1.....	643 1/2
Undercurrent No. 2.....	280 1/2
Undercurrent No. 3.....	253 1/2
Undercurrent No. 4.....	143 1/2
Undercurrent No. 5.....	69
Undercurrent No. 6.....	50 1/2
Total in Canyon.....	\$3,170 oz.

This amount (3,170 oz.) equals about 7% of the total clean up of the mine for this last fiscal year, during which period 595,000 miner's inches have been used, extracting \$290,834.47 gold.

Comparing these final results with those of the previous year (1875-6), the precious metal is found distributed throughout the sluices and undercurrents with the same relative proportion. This fact is especially worthy of note, since last year the bulk of the material moved was "top gravel," whilst this season a much larger proportion of cement gravel has been run through the sluices.

In the heavy cement at French Corral and Manzanita a high percentage of the gross yield of the mines is found in the undercurrents. The most efficient means of saving gold from cement

DIAGRAM SHOWING THE GENERAL ARRANGEMENT OF TAIL SLUICES AND UNDERCURRENTS.

foot box, and the width of sluice is 44 inches.

A system of riffles consisting of a row of blocks alternating with an equal section of rocks has been found to work successfully. This arrangement of the sluices materially reduces the wear and tear of the blocks, and has given excellent results. The block and rock riffles are not desirable for those sluices which have frequently to be cleaned up.

So far experience shows square block riffles to be the best for saving gold. The objection to their use is the cost of wear and tear. The most economical substitute is rocks, but sluices set with them require steeper grades and more water than those arranged with blocks. As a matter of convenience and economy, block riffles should be used in the head sluices of those claims where the gravel is rich, or where a large amount of gold is monthly produced and cleaned up.

## Charging the Sluices.

When work commences, the sluices are run half a day in order to pack them. A few moments before the quicksilver is added the water is run clear, and they are then charged. More quicksilver is added during the second and third days, the quantity being increased until the riffles hold the mercury at the surface. During the washings the sluices are repeatedly examined and recharged. The amount subsequently added is regulated by the quicksilver exposed to view; the total quantity required is more or less dependent on the length of the run. When charging the riffles all splashing of the quicksilver should be avoided. When it is sprinkled into the sluice (a practice to be condemned), it divides itself into minute particles, the bulk of which is easily carried off by the swift stream, while portions of it will even float in the clear water. The buoyancy of these small particles is very considerable.

Float quicksilver containing gold particles has been taken from off the surface of the water 20 miles from where the amalgam entered the stream. An instance of floating amalgam was observed on the north fork of the Yuba river. At a point four miles below where tailings were dumped, a flume (conveying water to a pump) was set 10 feet above the bottom of the stream, drawing direct without any dam. An examination of the flume, subsequent to its re-

work done at Gardner's Point during the last four years. The number of inches of water used at this claim during this period is not known. The number of cubic yards of gravel moved has been approximated from the best obtainable data, and an inspection of the property. From 1872-74 inclusive, about 143,000 cubic yards of dirt were moved. In 1875 the claim was only run 14 days full time. This year (1876) 40,000 cubic yards of gravel and 260,000 cubic yards of lava ashes were washed off. The gross yield from 1872-76 was \$140,000. The number of cubic yards of gravel moved during the corresponding time is sufficiently large to warrant the generalization that the present known appliances for catching gold are adequately effective.

## The Result of Working Tailings at Gardner's Point.

The tailings from all these washings were caught and confined in a ravine situated a short distance below the claim. The length of the sluice through which the gravel passed was 1,373 feet, with three undercurrents. This year the ravine, supposed by many to be exceedingly rich, was cleaned up on joint account by Chinese, under special engagement with the owners, and its gross yield was \$1,168, not 1% of the total receipts from the washings.

## On the Distribution of Gold throughout the Sluices.

In cleaning up sluices, the largest proportion, approximating 80% of the gold caught, is found in the first 200 feet of the head of the sluices. The gross yield of the Gardner's Point claims for the season of 1874 was \$68,000 for 100 days' run. Of this amount \$54,000 was obtained in the first 150 feet of the sluice, and \$3,000 taken from the undercurrents. The remainder was found lower down along the sluices. The first undercurrent was 790 feet distant from the head of the sluice, and yielded 50% of the total yield of the undercurrents. The second undercurrent was 78 feet distant from the first, with a drop of 40 feet between them, and it contained 33% of the gross undercurrent yield.

\* This occurred in 1864. The flume was owned by Mr. Banks, of San Juan, Nevada county.

† The aggregate number of days' work of all the claims.

‡ Each of these inches discharged 2,236 cubic feet of water per 24 hours.

Mr. P. Wright, Assistant Engineer for Water Supply, Beechwood district, giving his experience on this subject says that, "with a sluice 12 inches wide on an incline of one foot to 48 feet, using 600 gallons per minute, I have found 65% of the gold within three feet of where the gravel was filled into the sluice—where the gold was lying upon a smooth board, and yet a powerful current failed to move it."—*The Gold Fields and Mineral Districts of Victoria*, R. Brough Smyth, p. 185.

hour miner's inches of water (2,230 cubic feet each) conveying the tailings, passed through the tunnel, and were discharged through the tail sluice and undercurrents.

The annexed sketch shows the general arrangement of the tail sluices and undercurrents, which latter were subdivided into compartments as shown.

The distribution of the gold along the line of sluices and in the several undercurrents was as follows:†

## Tail Sluice, etc., from Dec. 1, 1876, to June 1, 1877.

Miner's inches of water, 24 hours each.....	\$50,000
150 feet at head down to No. 1 undercurrent, yield.....	\$3,150 00
150 feet remainder of sluice.....	\$50 00
Total.....	\$3,500 00

No. 1 Undercurrent.—Size, 24 by 36 feet; grade, 13 inches to 12 feet; chute, 2 feet wide at opening, contracted to 10 inches; iron rail riffles.

A yielded	Oz. amalgam	
B " "	108 1/2	
C " "	80 1/2	
D " "	40 1/2	3 clean ups.
Chute yielded.....	31 1/2	
Total.....	310 1/2 oz.	\$1,920

No. 2 Undercurrent.—Size, 24 by 24 feet; grade 12 inches to 12 feet; chute, upper end 2 1/2 feet, lower end 2 feet; iron rail riffles.

A yielded	Oz. amalgam	
B " "	48 1/2	
C " "	30 1/2	
D " "	15 1/2	2 clean ups.
Chute yielded.....	23 1/2	
Total.....	143 1/2 oz.	\$874

No. 3 Undercurrent.—Size, 24 by 36 feet; grade 16 inches to 12 feet; chute, 2 1/2 feet upper end, 2 feet lower end; rock riffles.

A yielded	Oz. amalgam	
B " "	50 1/2	
C " "	35 1/2	
D " "	15 1/2	2 clean ups.
Chute yielded.....	16 1/2	
Total.....	123 1/2 oz.	\$883

No. 4 Undercurrent.—Size 20 by 36 feet; grade, 12 inches to 12 feet; rock riffles.

71 1/2 oz. amalgam.....\$436

No. 5 Undercurrent (constructed in March).—150,000 miner's inches of water; size, 24 by 24 feet; grade, 12 inches to 12 feet; chute, 2 1/2 feet upper end, contracted to 2

\* The figures showing the yield of the undercurrents were calculated from the amalgam.

† I am indebted to Mr. H. C. Perkins, Superintendent N. B. M. Co., for the data given. The results show the total yield of the many places, the number of "clean ups" being noted in each case.

‡ 700,000 miner's inches water used in 1875-6, the yield was \$1,800.

## PROCURING PATENTS FOR MINING CLAIMS.

—Our readers will see in another column of this issue a notice of a new enterprise which Dewey & Co. have lately undertaken—the procuring of patents for mine and mill claims. This is an enterprise that for a long time many have felt the need of, and now that it has been undertaken by such a responsible firm, it is to be hoped that all locators will appreciate the advantages which they will derive from it, and give it their patronage. Too much stress cannot be laid on the advantage that Dewey & Co. possess in the fact that they have persons in Washington who will attend promptly to all applications and see that they receive immediate attention from the Commissioner; for every one knows how much more likely all applications are to receive immediate attention if presented by a person familiar with official business. Messrs. Dewey & Co.'s peculiar advantages for the successful accomplishment of this undertaking cannot but be appreciated when we consider their already large business with the department. This branch will be under the supervision of Mr. J. L. Boone, Esq., attorney at law, one of the members of this firm, who is well known on this coast and in Washington as a thorough and competent patent attorney.

THE DEXTER MILL.—The Butte Miner says: Now that the Dexter mill has passed into the hands of Mr. Clark we may look for a resumption of work at an early date. In fact, that gentleman informs us the works will be in operation in a week or ten days. Some repairs to the machinery are necessary, and when these are made we shall hear the joyful sound of the pounding stamps. We are all well aware what effect the stoppage of the Dexter mill has had upon the camp in various ways. The prospect is now good for a continuous and successful run for months, perhaps years, and the mining industry of the camp and the business condition of our town will receive immediate impulse. We feel confident in saying that the majority of our people are well pleased to know that the property is in the hands of so competent a person.

\* A paper read before the American Institute of Mining Engineers of the Wilkes-Barre meeting, May, 1877.

† The primitive riffles used by the South American gold washers, consisted of steps cut in the bare bedrock. Blankets and grass sods were also used to catch the gold. See detailed description of the gold washings of Jaraguá, "Manc's Travels," pp. 77, 78.

‡ The term cement is applied to a conglomerate which is chiefly cemented together by ferric oxide.

§ The gold particles were microscopic.

## Meat Packing and Compressing.

We have many columns on fruit shipping and drying, and on the methods employed for transforming milk into merchantable products. It came into our mind the other day that we were overlooking the progress which is being made in giving the meat surplus of this coast a permanent form, by the aid of which it may find its way to distant consumers. This special line of our industrial advancement is just as important to our stock and swine growers as the drying of fruit is to the orchardist, and we are pleased to announce that our investigation of the subject has put in our possession much interesting and valuable information. In a general way we can state that our city meat preserving establishments are extending their business and improving their facilities in a manner which promises increased demand for the raw material of the stock grower, and thus warrants breeders in putting forth renewed exertions for the improvement of their live stock and their pastures.

In the line of packing there has been great improvement of late, both in the quality of the goods produced and in securing markets for them. It is true that for a long time California salted meats had a poor reputation, and this was owing greatly to the fact that supplies came from retail butchers, who put down their unsalable meat to save it from waste, and thus put upon shipboard a sort of a refuse product, packed without the skill gained by special experience and without proper care in curing. So long as this system prevailed it was little to be wondered that California packed meats were in ill repute and declared greatly inferior to the product of the Eastern packing establishments. When the regular packers began operation in this city, there came into market a new style of goods, which has steadily won its way until, as noted in our market review last week, Wilson, Merry & Co., of this city, have won a crowning victory over Eastern packers by securing a contract to furnish 250 barrels of California packed beef to the U. S. navy. It is a matter of interest, as part of the history of the industries of this coast, to record the steps by which this victory was won for California beef. At first the naval authorities at Washington protested against the danger of supplying the ships with untried material and hinted at the mutinies, etc., which would break out on the ships if the meat should prove poor. Captain Merry responded that he wished no dangerous experiments of this kind, but merely asked that a few barrels of the California product should be put on shipboard and sent to the far away stations and subjected to a two years' test. By the aid of Senators Sargent and Booth this concession was granted by the authorities, and barrels were sent to the South Pacific and North Pacific squadrons and to China. The results of this test, and the judgments which were finally pronounced by the officers ordered to make the trial, etc., may all be inferred from the fact that the second navy contract for 250 barrels of California beef has been executed.

Another gratifying indication of progress which we would mention in this connection, is the uprising of a new industry which promises to prepare large quantities of California meats for export to distant consumers. It is the manufacture of compressed meat. This meat comes upon the market in neat tins of different sizes, and is so prepared that all the eater has to do is to slip out the contents of the can upon a plate and take up his knife and fork for a meal. The process of manufacture in this city is the same recently introduced in the Eastern canning establishments, by which the meat is slightly corned, then cooked and compressed into tins which are finally subjected to what is known as the vacuum process. This method makes a shrinkage of about 60% from fresh weights, but as all the bones, sinews and surplus fat is taken out in the process, the result is much more desirable meat than that heretofore packed as fresh meat, cooked by roasting and otherwise. This manufacture is now carried on in this city by four firms: Wilson, Merry & Co., the Cutting Packing Company, Sol. Wangerheim & Co. and Fenssler & Birgham. The product now packed annually is about 3,000,000 pounds, and the business is increasing rapidly. The material used is chiefly beef, but compressed mutton, ham and deviled ham are also produced. The market for these meats is chiefly found in our interior mining trade, for shipping and export and for naval use. Wilson, Merry & Co. have supplied two contracts to the French navy and have the highest testimonials of quality and durability. In general it may be said that the quality of California compressed meat is pronounced by experts fully equal to any made elsewhere, and frequently superior, as the price of beef here admits of using parts of the animal which cost too much at Eastern points, because the demand for these parts for local consumption takes all that are offered at high prices.

The most gratifying feature of this trade to us, and must be to all producers of meat supplies, is that due attention is being paid to enterprises for profitably using our surplus grazing products. Upon these the future of our live stock interests must depend in a large degree, and, if just transportation rates can be secured, it will not be long before the provisions, which we can produce more cheaply than our Eastern competitors, will soon secure for us the mastery in the markets of the world.—*Rural Press.*

## Sale of the San Juan Mines.

The *Silver World* says: The heaviest sale of mining property recorded in San Juan was made this week by Brookover, Wright & Co., who sold the celebrated Wheel of Fortune lode, together with the noted lodes—Mark Twain, Grand Trunk, Monetizer, Mountain Queen and Prospector, six in number, all located upon Mt. Sneffels, for the snug sum of \$160,000. The purchasers are Byron J. Smith and Abram G. Hoyt, who have been for some time interested in mining operations in Burrows park, being the owners of the celebrated American Eagle and other well known lodes in that district. The transaction is *bona fide* and a strictly cash one, the money being paid down. The Wheel of Fortune is considered the best developed, as it is one of the richest mines in San Juan. The mineral is chiefly ruby silver. The Monetizer, Mountain Queen and Prospector are extensions on the same vein. The Grand Trunk and Mark Twain are cross lodes, and are mammoth veins, carrying galena rich in gray copper.

The recent owners were Messrs. Brookover, the Wright Bros., Mason Greenlee and S. H. Crowell. The Wright Bros. have taken a contract to work the property for the purchasers. The other members of the former company take their share of the cash and elect to spend a portion of it in enjoying themselves at their old homes, and passed through here Thursday en route for the East.

The fortunate purchasers are gentlemen of wealth and enterprise. They know they have a fortune in their purchase, and they propose to develop the property and take out a few of the thousands in sight—it is estimated by good judges that there is at least \$200,000 worth of ore in sight in the Wheel of Fortune alone.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

## The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy,

Containing 672 Pages and 83 Engravings BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE—bound in cloth, \$10.50; in leather, \$12. Forwarded by mail for 50c. extra, at the Mining and Scientific Press Office, by DEWEY & CO.

## HOW TO ADVERTISE.

The following views of some of our most successful business men, says an exchange, will be very generally concurred in:

"The tawdry lithographs so freely used by certain manufacturers neither express good sense nor good taste; they suffer even by comparison with the comic valentine, for although the latter is essentially vulgar, and frequently a hurtful missile in the hands of a foolish or a malicious person, it means something; it has about it some touch of humor—it tells for what it was designed. But the stove manufacturers' valentine, I mean the red and yellow lithograph, has no redeeming qualities about it. At best, it but announces the thoughtlessness or want of dignity of its author; and if it does not hint with a certain degree of positiveness at the probable inferiority of his wares, it is less injurious than I have been inclined to regard it."

"Fence advertising cannot be too emphatically condemned; to characterize it as vile is scarcely to do it adequate justice. It is primarily objectionable, because it brings the manufacturers who wish to advertise into doubtful company on the public highways; and every prudent business man must know, if he has given to his advertising the careful attention it deserves, that the money devoted to papering fences is utterly wasted. We know a landowner who expends \$150,000 annually for advertising, but you cannot find his name on the fences; he is the best advertiser in the country, but there is nothing comical or grotesque about his way of doing business."

"The glaring poster neither inspires confidence nor conveys the information the public desire; and if we would make the best possible use of our money in giving publicity to our claims as manufacturers, we should patronize able and responsible newspapers. The newspaper is immeasurably the best medium open to our trade; the most liberal and expert advertisers testify to its value; and in the employment of its columns we would find a means of escape from the wasteful, undignified and ineffective methods to which so many now resort in their eager desire to secure attention and patronage."

TESTING AND WORKING SILVER ORES.—This is the title of an illustrated work of 114 pages, for Miners and Prospectors, by Chas. H. Aaron, published by Dewey & Co. It is written for miners, in plain language, and with all necessary details in description. The author describes the different processes of roasting ores, the appliances, methods of testing ores, testing for a process, working samples, treatment of base metals, use of chemicals, leaching processes, different kinds of crushing apparatus, etc. This little work abounds with useful hints to miners and prospectors, and is written in a practical style. Price, post free, \$2.00. Address, Dewey & Co., Mining and Scientific Press, 224 Sansome St., San Francisco.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver ores generally, with 120 Lithographic Diagrams, 1867. The most complete treatise. Published at this office. Price, \$7.50. Postage, 50 cents extra.

ROASTING OF GOLD AND SILVER ORES, and the Extraction of their Respective Metals without Quicksilver, 1870. It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. Price \$2.50 coin, or \$3 currency, postage free. Published and sold at this office.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and the subscribers against the acts and mistakes of others.

## HENDY'S \$1,000 CHALLENGE ORE FEEDER.

I call my Automatic Ore Feeder the \$1,000 Challenge, because I challenge the owners or backers of any other feeder to a competitive test for that amount. As Mr. O. G. Rodgers, Superintendent of the Oreen Mountain mine, near Oreenville, Plumas county, appears prominently as a detractor of the merits of my feeder, and seems confident that another one is better, perhaps he will accept this long-standing challenge which the owners of other patents will not, and give me an opportunity to prove publicly the superiority of my machine. As to Mr. Rodgers' assertion about my feeder wearing out, it is no less fallible in that respect than other machinery; but I have over 250 now in use, some of them for over two years, and have never had to expend 25 cents for repairs. The fact that my feeder received the premium at the late Mechanics' fair, and that I am shipping several feeders weekly to different parts of the country, is sufficient proof of the appreciation in which it is held.

As to my feeders having been thrown out of the Gold Stripe mill, they were not displaced for inefficiency, as the following letter will show, and it answers also as a complete refutation of Mr. Rodgers' statement:

OFFICE SUPERINTENDENT OF THE GOLD STRIPE O. M. CO., GREENVILLE, PLUMAS CO., OCT. 16TH, 1877.

JOSHUA HENDY, Esq.—Dear Sir:—Your favor of the 15th instant at hand. In reply to your inquiry as to the working of your ore feeders at our mill, we can say that there is no fault in the machines, and we consider them the best now in use. At present they are not in use with us, owing to the construction of the mill, which we are about to rebuild and make proper arrangements for putting in your feeders.

J. K. OWEN, Superintendent Gold Stripe Mine.

One of the principal owners of the Gold Stripe and Oreen Mountain mills is also largely interested in the Plumas National mine, where I have just shipped several feeders, showing the confidence placed in the machine by these gentlemen who have used it.

Now, if Mr. Rodgers is sincere in his belief as to the merits of a rival machine over mine, here is a chance for him to make a thousand dollars easily, if he can get the owners of the machine to lend him one for the trial, which is the only doubtful thing in connection with the matter. Mr. Rodgers' eight months' experience with both machines ought to give him confidence enough in his own convictions to accept the challenge offered to him, or any one else.

JOSHUA HENDY.

Corner Fremont and Market Streets, San Francisco.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly. The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a simple holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from this office for 50 cents, postpaid. Wholesale and retail agents wanted.

## Mining and Scientific Press

is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers, S. F.

## ARTIFICIAL LIMBS.

MENZO SPRING, MANUFACTURER OF ARTIFICIAL LIMBS. OFFICE AND ADDRESS, 9 Geary St., San Francisco. Descriptive circulars, blanks for measurements, with instructions and price list free on application.

## To Ship and Engine Builders, Steamship Companies, Etc.

A Mechanical Engineer, having an extensive experience in Marine Engineering (especially compound) and Iron Ship Building, also in Steam Engines and Machinery in general, is open for engagement. First-class references.

Address and references can be obtained at office of Scientific Press.

JOHN L. BOONE,

Attorney and Counsellor at Law,

PATENT LAW A SPECIALTY.

Office—202 Sansome Street, N. E. corner Pine Street, San Francisco.

## Newspaper Fileholders.

Dewey's new elastic fileholders (black walnut), size of the Press, *Harper's Weekly* and *Scientific American*, for 50 cents. Larger sizes to suit any newspaper, 75 cents. By mail, postpaid, 10 cents extra. Cash with all orders. Patent allowed. Address, Dewey & Co., Publishers, San Francisco.

## HUNT, DOUGLAS &amp; STEWART Process,

Used in Connection With PURVINE

## Wooden Amalgamating Pans and Settler.

This is a complete, perfect and economical adaptation of the humid method to the treatment of Gold or Silver ores, associated with

## COPPER

And other base metals, or to ores free from base metals. It can be adapted to any first-class Gold or Silver mill, at a reasonable additional expense.

For further information, address

J. O. STEWART, Georgetown, Colorado.

## Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

A 16 Candle Light for One Thousand Hours at a Cost of 30 Cents.

## WREN'S PETROLEUM GAS WORKS

Are now doing this in Towns, Cities, Mills, Hotels, etc., where in use. The same amount of light from coal gas, at \$3 per 1,000 feet, will cost \$15. Send for references.

W. C. WREN, Cor. Jay & Water Sts., BROOKLYN, NEW YORK.

## MINING INTEREST FOR SALE.

For a small amount, in several claims on one of the

## RICHEST LEDGES IN ARIZONA.

Money needed for development. The ore will pay a handsome margin to ship to the city. Apply at this office.

## San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes: Tanned Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS & CO.,

611 and 613 Front Street, San Francisco

## PACIFIC RURAL PRESS,

A first-class 16-page Illustrated Agricultural Weekly, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Send for a sample copy.

DEWEY & CO., Publishers, S. F.

## MINERS, ATTENTION!

In reference to the advertisement of Mr. H. C. Perkins, warning miners against using my patent Deflecting Joint for hydraulic pipes, I want it distinctly understood that I fully guarantee all my customers and will defend all suits. I think it is probable that by the time Mr. Perkins gets through he will realize the difference between commencing a lawsuit and winning one.

RICHARD HOSKIN.

Dutch Flat, Sept. 17, 1877.

**PACIFIC BUSINESS COLLEGE,** 320 POST STREET, Opposite Union Square, San Francisco.

This institution imparts a first-class Commercial Education, a practical knowledge of Telegraphy, and thorough instruction in the English and Mathematical branches, Penmanship and the Modern Languages. It has ever been a cardinal principle in the management of the College to provide thorough and practical courses of study. Every available modern improvement has been introduced, and whatever energy and liberal expenditure of money could do, has been done to place the institution at the head of similar schools.

**LIFE SCHOLARSHIPS**

For a complete Business Course are issued at the low rate of \$70. This is the only Business College in the State that employs this liberal system of tuition fees. Day and evening sessions during the entire year. Ladies are admitted into all the departments. Each student receives separate instruction. The discipline at the school is excellent. Graduates at the Pacific Business College find little difficulty in obtaining good situations, being preferred by our business men to the graduates of any similar institution. Those who desire to prepare themselves for the practical duties of life, at the least expense of time and money, should examine the merits of this school before attending elsewhere. Send for circulars.

We have the best Imitation Gold Watch in the Market for Trading Purposes. The metal is a composition of other metals, and closely resembling gold, but that the best judges find it difficult to detect the difference, except by a chemical test, and it has the virtue requisite to make it the best substitute for gold known. GENUINE AMERICAN MOVEMENT. EXPANSION BALANCE. BEAUTIFULLY ENGRAVED OR ENGINE TURNED HUNTING CASES, and equal in appearance to a GOLD WATCH THAT COSTS FROM \$150 TO \$200. It sells and trades readily, for from \$40 to \$100, and if you wish a watch for your own use or to make money on, try this. Owing to our large sales, we are enabled to reduce the price of them to \$12 each with an elegant Chain attached. They are sold on Railroad, Seamen, and in Manufactories, and other places where accurate time is required, and above general satisfaction. We send them by Mail or Express, on receipt of \$12, to any part of the Country, or it will be sent C.O.D. when the customer desires and remits \$2 on account. These Elegant CHAINS, which about Fifty Pennyweights, and the same pattern in pure gold would cost \$100. We sell these Chains in each, but we sell the Watch and Chain for \$12, sent by Mail in a Registered Package, post-paid, to any Post Office in the United States.

WE SELL THE WATCH WITHOUT THE CHAIN FOR \$10.  
 J. BRIDE & CO., Clinton Place & No. 11 Eighth Street, N. Y.

**Buy the Best.**

Before purchasing an American Watch, examine the different styles manufactured by the HAMPDEN WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

## The Philosophy of the Hendy Concentrator.

(Written for the PRESS by CHAS. C. RUCKER, M. E.)

### Sifting Action.

There remains to be considered what has been termed the sifting action of the pan, to which the separation below the surface must mainly be ascribed, and which seems to me the most important action of the machine, because to it the separation of the finer sulphurets is principally due. It is known that well-sized, rocky substance occupy or fill 50%, globular grains 70%, grains or pieces of various size 62%, of the space which they apparently assume. This is proven, for instance, by the weight of a cubic foot of coarse quartz sand: One cubic foot of solid quartz weighs about 162 pounds, 62% of which is 100 pounds, which, on trial, will be found to agree closely with the weight of one cubic foot of sand answering the condition above stated.

This would indicate, then, that the spaces left between the particles of classed or sized sand, are about equal in volume to the sand itself. This would, of course, facilitate the downward motion of the heavier particles, which are approximately of equal volume as the spaces between the grains of quartz; their form, however, being different, the spaces will rarely be sufficiently large to admit the grain. But, of course, the larger the spaces, so much less the motion required to effect the conditions of free fall and displacement, necessary to separation, as above explained.

In the case of graded sand, we have the conditions necessary to leave only about one-third space between the particles, which, as has been said, occupy 62% of the apparent volume; the volume of the spaces is, therefore, about one-half of that of the particles themselves.

As has been stated above, the ratio of diameters of graded quartz and iron pyrites particles is as 1 to 2.5. This cannot, however, be strictly the case between each individual particle in the grade, as their size varies almost infinitely from each other, and the grading can only be regulated to confine these differences within certain limits, which do not exceed the equal size or the mean between the smallest particle of pyrites and the largest particle of quartz, nor the square of the normal ratio of diameters. The ratio between the diameters of the smallest grain of pyrites and that of the largest grain of quartz, would hence be as 1 to 6.25.

It has also been stated that the ratio of volumes between graded particles of iron pyrites and quartz is as 1 to 15.6, whereas the ratio between the spaces and the particles is as 1 to 2. The average space left between the grains of sand is, therefore, eight times as great as the average volume of the pyrites particles, or equal to a ratio of diameters of 2 to 1. It is evident, therefore, that in this case there is ample room and opportunity for the pyrites—or whatever the denser mineral may be—to work down between the sand, when aided by the shifting action of the water and the oscillations of the pan. The operation of Hendy pan may really, in this case, be termed a sifting in water of the denser particles, through a sieve formed by the particles of the less dense mineral, the only retarding agency being the cohesion of the particles, which, however, is not constant, because it is intermittently broken by the shifting of the sands, caused by the oscillations of the pan and the current towards the central discharge.

The very finest ore particles cannot, however, resist the floating action exerted by the rapid swinging motion of the water and sand, and will be kept in suspension and eventually carried out by the waste current through the central discharge.

### Advantage of Continuous Discharge.

It is easy to see that this continued sifting of the fine particles down into the spaces left between the coarser, must result in an increasing compactness of the mass towards the bottom, and a relative accumulation there of the finest products of separation. The immobility of the mass must keep step with the decrease of space, and gradually cause a packing of the sands in the bottom; and with this stoppage of motion, the density of the particles must also gradually cease to assert itself. A continuous discharge of the concentrates from the bottom of the pan counteracts this, somewhat, on account of the current towards the discharge hole resulting therefrom; but on account of the practical difficulties experienced in properly regulating such a continuous discharge, so as to suit other requirements of the general manipulation; the preference is still given to a well regulated but intermittent discharge, in many mills that use the pan successfully. No doubt a self-discharging device, free from the objections hinted at, would be a useful addition to the machine. This cannot be accomplished by any arrangement simply regulating the discharge orifice; it must regulate itself automatically, according to the accumulation of sulphurets in the pan. Such a solution has been attempted several times, but so far, not successfully, it seems.

### Review of Action.

If we briefly review the part which each of the actions described plays in the concentrating work of the pans, we see: That the centrifugal impulse arranges the sands according to their absolute weight, bringing within the same zone

particles of the dense mineral with larger ones of the less dense, at the same time elevating the surface towards the periphery.

The crank motion causes alternating periods of suspension and subsidence of the particles near the surface—notably at the periphery—which tends to bring the less dense mineral to the top; while on the deeper strata a sifting action is produced, allowing the passage downward of the smaller and denser particles, through the pores or spaces between the larger, lighter particles.

The less dense mineral thus brought to the surface is swept by the current down the incline to the central discharge, leaving the denser particles that have still been mixed with it near the periphery. The larger particles are affected most forcibly by this action, but somewhat retarded by the recurrence of centrifugal impulses.

With the accumulation of the denser mineral at the periphery, the conditions for discharge of the waste by direct displacement become more favorable.

### Conclusions.

That a machine acting on such a remarkable combination of correct principals, should be capable of giving a good result, cannot be surprising; but to do this the conditions must be fulfilled, which allow a sufficient development of such actions. This can only take place undisturbed in a machine properly made and set up and kept free of injurious vibrations; run at a speed properly adjusted to the qualities of the sand, and properly fed with pulp, together with a sufficient supply of water. The proper centrifugal action can only develop itself at a sufficient rapidity and scope of the oscillations, and a sufficient supply of water is very essential to an effective, yet not excessive discharge of the waste sands.

A most important aid to the attainment of the latter end is the new arrangement of pulp-distributing pipe, which being self-propelling, insures a regularity of feed, and a diagonal sweep of the water to the discharge, not attainable with the earlier arrangement, but very material to the successful working of the pan.

Of course the foregoing does not represent fully or correctly the details of the action of the Hendy pan; it is merely an imperfect theoretical outline of those agencies and conditions which are mainly instrumental in effecting separation, by the working of simple and well known mechanical laws. An attempt at complete consideration of the auxiliary influences that affect its working would lead too far, and would also be useless, for the most elaborate theory could not be made to conform entirely with the results of practice, because the conditions are necessarily indefinite, on account of the almost infinite variety of form and composition in the particles operated on.

In the main, however, the explanation is correct, because it is founded on facts, and it is also borne out by actual experiments.

### Condition of the Concentrators.

That a clean concentration cannot be expected at the first operation in the pan will be readily understood when it is considered that there is nothing to prevent the sifting downward of the fine sand except the displacing action of the denser particles, which avails only in so far as it takes effect on particles of equal or greater size. The bulk of the sand, separated with the sulphurets in the first pans will, therefore, be as fine as the sulphurets themselves; its displacement is impracticable, because coarse sulphurets will discharge with the waste before the accumulation is sufficient for displacement. With ore containing 2% to 3% sulphurets, the concentrate from the first pans will yet contain 70% to 75% sand by volume. By running these concentrates together into a lower pan, reworking them, the conditions for displacement are fulfilled, and a very clean product obtained by allowing the pan, when filled with second concentrates, to run some time without feed, but with clear water alone, so as to give the last portions of admixed sand an opportunity to work off. As long as the feed is continued, not even the second concentrates will be obtained clean, except by a well regulated continuous discharge, and a previous separation of the coarser sand.

### Loss of Sulphurets.

It is not difficult to understand that the loss of sulphurets from the pan, under these conditions is composed mainly of very fine sulphurets, which are kept suspended by the agitation, and are swept out of the discharge before they have time to settle in the less agitated central portion of the pan; on the other hand, the coarse sulphurets, working to the top at the periphery, are rolled down the incline to the discharge. In a number of carefully made panning tests of waste from the upper Hendy's coarse sulphurets were found to compose one-third to one-half of the whole amount panned out, the rest being mostly very fine. This condition is most apparent in the waste from the second pans, from which the loss is, of course, proportionately greater, the material fed being about ten times as rich as that fed into the first or upper pans.

### The Influence of Grading.

The foregoing naturally leads to the conclusion that by separating from the battery pulp the coarsest and the finest particles, and treating each under conditions most favorable to separation, the intermediate sands would be concentrated with more success in the Hendy pan than the mixed sands.

The simplest way to accomplish this would,

no doubt, be that of grading or assorting the sands by their speed of fall in flowing water. As already explained, the result of this work is the separation of the particles in a certain ratio of diameters to density. The coarsest particles of sulphurets and quartz would be found in one grade, the average size of the particles answering to the formula:

$$\frac{\text{diam. A.}}{\text{diam. B.}} = \frac{\text{Sp. gr. B.}}{\text{Sp. gr. A.}}$$

The denser particles would therefore be smaller in each grade than the less dense, a condition most favorable to the separation by sifting and buddling, at the same time diminishing the influence of the unfavorable factors. By carrying the grading to a sufficient extent, so that the finest particle of sand would be no smaller than the largest particle of the denser mineral, we would attain the condition necessary to a clean separation of the sulphurets in one operation. To effect this, however, in the case of pyrite and quartz—or any minerals having the same difference in density—when crushed through screens of, say 24 meshes to the linear inch, would necessitate a division into at least 10 grades. Each of these grades would of necessity require a separate pan, to do the work continuously and with the least expenditure of labor. As ten 10 pans, used in the ordinary way, work the sand from 20 stamps, such a preliminary grading would have to be done on a corresponding scale to avoid the objection of first cost and running expenses, etc., on a proportionately greater number of machines than at present. It is being assumed at the same time that the cost of the grading is amply compensated by the better results to be obtained thereby.

It is not to be supposed, however, that each grain of sand will be obtained in just the proportion required to equally supply each Hendy pan, nor in the proportion of the capacity of each one to work up that particular grade. This will appear from the following table, showing the proportion of sizes in a battery pulp from one of our largest California quartz mills, the Keystone, Amador City:

30 meshes to the linear inch.....	11.5%
40 meshes to the linear inch.....	7.75%
50 meshes to the linear inch.....	14.5%
60 meshes to the linear inch.....	11.5%
70 meshes to the linear inch.....	11.5%
80 meshes to the linear inch.....	5.25%
90 meshes to the linear inch.....	4.75%
100 meshes to the linear inch.....	2.75%
100 mesh siftings.....	30.0%
Total.....	99.50%

The proportionate amount of sulphurets was determined in each size, and was found to increase with the fineness of the size, the siftings from the 100-mesh sieve containing as much as the aggregate percentage of equal volumes of the other sizes.

This proportion of sizes would, of course, be changed by grading, influenced principally by the nature and quantity of the denser mineral, several of the finer sizes of which would go with each coarse size of sand; for instance, in the grade where coarsest particles of sand remain on a sieve of 30 meshes to the linear inch, we should find no sulphurets remaining on a 60-mesh sieve, if we conform to the conditions of grading, giving a ratio of diameter as 1 to 2.5. The quantity of sulphurets present in the above ore being small—in few cases of gold quartz ores worked in California exceeding 5%—it may be assumed that the result of grading would approximate to that of sizing above given, proportioned to conform to the requirements of graded sand.

To arrive at this proportion we must know the absolute size of the holes for each number of sieve, because this size is by no means proportional to the number of meshes, the size of the wire used growing finer with the increase of meshes.

The following table is calculated from a measurement of the wires accurate to 1-100 of a millimeter:

Brass Cloth.	Thickness of Wire.	Aggregate Thickness of Wire.	Hole.
20 meshes.	0.35 mm.	7.00 mm.	0.50 mm.
30 meshes.	0.30 mm.	9.00 mm.	0.53 mm.
40 meshes.	0.23 mm.	9.00 mm.	0.40 mm.
50 meshes.	0.18 mm.	9.00 mm.	0.39 mm.
60 meshes.	0.18 mm.	10.80 mm.	0.24 mm.
70 meshes.	0.14 mm.	10.08 mm.	0.21 mm.
80 meshes.	0.12 mm.	9.60 mm.	0.19 mm.
100 meshes.	0.086 mm.	8.60 mm.	0.164 mm.

We see from this that the sizes obtained from sieves, ranging between 18 and 100 meshes to the linear inch, include just two grades answering to the proportion of diameters 1 to 2.5. The first grade would include the screenings of No. 18 and the leavings of No. 40; while the screenings of No. 40 screened on a No. 100 would leave on the latter the second grade. From the pulp mentioned, we would thus obtain in all three grades, weighing 20%, 50% and 30%. On account of the mechanical defects of grading, the simple scale cannot be relied on to give a product answering to the requirements of theory, and to cover these defects the double scale is generally used, even in the separation of galena and quartz. Applying this here, our scale of double grades would correspond to the sizes 0.16 to 0.25 to 0.40 to 0.64 to 0.100 mm. in a retrograde view, and the corresponding percentages of pulp sand are  $\frac{30}{x}$  24, 26, 13, 7.

The coarser grades, which can be worked off most rapidly, would be obtained in the least quantity, as here shown.

### Objections to Grading.

We can expect, then, that some of the pans would be overfed, while the feed of others would not be equal to their working capacity. True, graders can be constructed adjustable, so as to give in each any proportion of deposit de-

sired; these are undoubtedly preferable, though somewhat more complicated than others, but by such adjustment we fail to fulfill the requirements of a specific proportion in the size of the particles. To keep this discrepancy within proper bounds, we must still further increase the number of grades.

There are also other obstacles in the way of grading in common the pulp from 20 stamps, which will be apparent to those acquainted with the practical details of amalgamating operations, as in use in California gold quartz mills. These make a constant volume and composition of the battery pulp practically impossible, without arrangements again objectionable for other reasons. Consequently the requirements of a sufficient grading for the Hendy pans cannot here be fulfilled, because in the working of most ores, the requirements of amalgamation must take precedence to those of concentration.

Another objection to grading is the amount of fall required by most graders, such being rarely at disposal in existing mills. In view of this the attempt has been made to construct a grader, self discharging and continuous in action, within a fall of 20 inches between battery discharge and inlet of Hendy's pans. To be more independent of the influence of irregularities caused by the amalgamation in the batteries and on copper plates, and to suit the requirements of small mills, the grader was gauged to take the pulp from only five to ten stamps. The coarsest sand being separated by a trap and returned to the battery for finer pulverization, the rest of the pulp was separated into four grades, and each of these worked continuously in a pan by itself.

The resulting concentrates still contained about two-thirds sand, being somewhat richer than those obtained without grading. The concentrates from the three coarser grades, sifted on wire cloth with 100 meshes to the linear inch, left on the sieve 60, 36 and 16%, respectively, containing in these leavings 1-5 to 1-20 sulphurets; the siftings contained in no case much more than one-third sulphurets.

This would indicate that a certain, nearly constant proportion of fine sand separates with the sulphurets and will not separate from them so long as the feeding of pulp is continued, because the larger particles in the latter prevent the fine sand from reaching the surface where it can come under the influence of the buddling action of the water flowing to the central discharge. By interrupting the current of pulp, and feeding for sometime only water, the separation would probably become perfect, at least near the bottom, but it is naturally found more advantageous to perform this operation in a separate pan, placed below the others, so as to take the first concentrates from a sufficient number to fully utilize its working capacity. In this way the working of all the pans can go on uninterruptedly and in a manner requiring the least supervision.

It is very doubtful even, that this separation of fine sand with the first concentrates, would be sufficiently prevented by a system of grading as extensive as above intimated, because some fine sand will always accompany even the coarsest grades, no matter what construction of grader is used. The friction of the water along the sides, eddies, etc., unavoidably produced in any apparatus, prevent the realization of a grading theoretically perfect. The coarser grade from the grader used as above mentioned, although subjected to a strong upward current of clearing water during its separation was found to leave on a sieve of 100, 70, 40, 30 meshes to linear inch, 98%, 96%, 71%, 64% of grade.

The ore yields about 1-5% of "clean sulphurets" by the concentrating operations on about 2,600 tons per month. A number of carefully-made panning tests of the pulp gave an average of about 2% sulphurets in the ore. Even the small quantity of finest sand, 4%, found in the grade mentioned, if it sifts down with these 2% sulphurets found, would result in a first concentrate, not more than one-third sulphurets, such as was actually obtained from the same.

With such evidence that grading will not dispense with the necessity of a second concentration of the concentrates from the first pans, no advantage can be claimed for its use, unless it can be proven that it is otherwise beneficial, in effecting a greater saving of sulphurets than that attained by working the mixed pulp.

This question can only be settled by thorough comparative tests on a large scale, on the same ore and under other like conditions. There does not seem to be much encouragement to make such a comparative trial, where, as in this State, the ore to be treated contains only a low percentage of the mineral to be separated, and this is itself not very valuable. Under proper treatment with the Hendy pans, the loss on that part of the sulphurets contained in the pulp, which would be practically susceptible of extraction by mechanical means, was found to be only 12% at the first pans, and only 22% in the whole work; this is exclusive of that lost by float, which, however, cannot be utilized with any apparatus. Of the 22% here mentioned, a considerable part is caught in some mills by reworking the wastes in sluices, the product consisting principally of coarse sulphurets, lost from the Hendys in the manner above explained.

### Probabilities of Improvement.

In this point it is probable that an improvement could be made by separating these coarse sulphurets from the pulp before it goes into the first pans, giving to these only sands that will pass through a sieve of 36 to 40 meshes to the inch. The coarse material could be worked at

little expense, and very effectively, in a fine sand jigger. Possibly a further saving would be effected by running the waste pulp from all the pans into a funnel tank, discharging the coarse deposit from the bottom, while the finest slum is run over into another funnel tank of larger dimensions, discharging the fine sediment into some separating machine suitable for such work. Of such I may mention Rittinger percussion tables, revolving continuous buddles, and Frue's vanning belt.

It has been accepted as an axiom almost in rational concentration, that sizing or grading of the material is absolutely necessary to effect a good separation with any concentrating machine. To this rule the Hendy pan, in its newest construction, presents a notable exception. I do not hesitate to assert that sizing will not improve the separation in the Hendy, and that grading will only do so to such a limited extent as to make it practically valueless; and that any gain to be derived from a more perfect separation by the use of grading is canceled by the complications and other disadvantages attending the use of the additional apparatus necessary.

Introducing the treatment for the coarse stuff suggested, and, perhaps, also that of the finest in the case of rich sulphurets, I will say that of all the concentrating machines at present in successful practical use for wet concentration, either in Europe or America, none will effect the concentration of medium grade sands, under the peculiar conditions presented in our amalgamating stamp mills, with equal ultimate economy, as the Hendy in its present form, when properly used; and none of them can compete with it in the effectual working of un-sized and ungraded sand, where systematic concentration, by reason of the nature of the ore, cannot be made the leading consideration in the treatment.

In view of the simplification of work thus attained, by dispensing with grading, etc., and the advantages in the arrangement of machinery, it appears but an act of justice to the inventor, and a benefit to those interested in the development of our mineral resources, as well as information of importance to the student of the art of concentration, to thus publish the assertions here made, thus inviting discussion and criticism from those whose practical experience will enable them to contradict or correct.

### New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office, at San Francisco: GENERAL CONYER M. Co.—Oct. 20th. Location: Enreka county, Nev. Capital stock, \$5,000,000. Directors—P. E. Conner, C. F. MacDermot, G. W. Blake, C. M. Levy and C. Schomaker.

TRAVELERS M. Co.—Oct. 20th. Location: Los Angeles county. Capital stock, \$100,000. Directors—G. W. Hopkins, Geo. C. Pratt, W. B. Rathbone, Chas. H. Fish and A. W. Havens.

CHIEFTAIN G. and S. M. Co.—Oct. 24th. Location: Inyo county, California. Directors—R. D. Coldren, H. Bartling, H. N. Clement, Chas. Moore and C. J. Platt. Capital \$10,000,000.

THE SEVENTY-SIX S. M. Co.—Oct. 24th. Location: Arizona. Directors—Fred W. Hadley, Clinton Gurnee, John C. Hall, L. Vassar and D. L. Thomas. Capital, \$1,000,000.

HOPE CON. M. and M. Co.—October 24. Location, Storey Co., Nev. Capital stock, \$2,000,000, in 200,000 shares of \$10 each. Directors—John Drenier, George Klein, G. Bacciga, John Miller, Louis Wilkie, Anton Ewald and John Sprecht.

COLUMBIA PETROLEUM Co.—October 24. Location, Cal. Capital stock, \$800,000, in 60,000 shares of \$10 each. Directors—O. H. Brooks, George S. Fife, E. A. Gupit, Joseph J. Stiner, Jacob Schreiber, J. D. Swift and William Andrews, Jr.

PASADENA M. Co.—October 24. Location, State of Nev. Capital stock, \$10,000,000. Directors—R. Weber, W. B. Crane, Thos. Cole, J. C. Riley and C. W. Crane.

EXCELSIOR COAL Co.—October 24. Capital stock, \$100,000. Directors—William L. Higgins, John H. Boalt, Henry K. Moore, Frank J. French and Fred. D. Brandout.

THISTLE M. Co.—October 24. Location, State of Nevada. Capital stock, \$10,000,000. Directors—S. P. Middleton, W. S. Duval, A. C. McCracken, T. J. L. Smiley and G. A. Kne.

BITTER CREEK HYDRAULIC M. Co. Oct. 25th. Location: California. Capital stock, \$480,000. Directors—Frank Shepard, R. L. Taylor, H. E. Bothen, J. J. Scoville and Jerome Waite.

MAYFLOWER GRAVEL M. Co.—Oct. 25th. Location: Placer county, Cal. Capital stock, \$1,200,000. Directors—W. N. Graham, T. Chappell, J. C. H. de Tevel, T. F. Leuterwasser and C. L. Des Roches.

ELKO M. Co.—Oct. 25. Location: Elko county, Nev. Capital stock, \$10,000,000. Directors—T. P. Boyer, A. D. Allen, N. B. Hall, C. C. Burton and L. S. Hall.

### September Bullion Product.

Following is an official statement of the bullion product for the fiscal month of September, of the leading mines in California, Nevada, Utah and Arizona:

Alps	\$14,300
Black Bear	17,000
California	1,535,000
Chollar-Potosi	22,300
Comanche	20,300
Con. Virginia	1,342,300
Empire (Grass Valley)	11,100
Empire (Howland Flat)	21,700
Endowment	13,700
Genova Consolidated	431,200
Genova Consolidated	7,100
Grand Prize	58,300
Indian Queen	5,200
Idaho (Grass Valley)	38,000
Justice	221,000
K. K. Consolidated	45,000
Lead	21,100
Leopard	13,400
Martin White	35,000
McCracken Consolidated	22,400
Manhattan	111,500
Minuetta Belle	18,000
Modoc Consolidated	28,200
Northern Belle	121,200
Ontario	173,500
Raymond & Ely	24,900
Rye Patch	20,400
Standard	153,700
Tyho Consolidated	23,200
Total	\$4,578,000

## PATENTS AND INVENTIONS.

### List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING OCTOBER 10TH, 1874.

WINDMILL.—A. M. Abbott, Stockton, Cal.  
AXLE GAUGE.—W. C. Carlton, Boise City, Idaho.  
WASHING MACHINE.—Aron M. Coriellus, Oregon City, Oregon.

CANDLESTICK.—J. Felling, Unimilla, Oregon.  
BALING PRESS.—Milton S. Laird, San Luis Obispo, Cal.

DRAWING PEN.—Bethune Perry, Alhambra, Cal.  
CHEESE PRESS.—W. H. Atkins, San Luis Obispo, Cal.  
DEVICE FOR RELEASING ANIMALS FROM STALLS.—Daniel R. Martin, S. F.

RIGHTING SCREW.—Michael L. Mery, Chico, Cal.  
PROCESS FOR REDUCING SILVER ORES.—Carl A. Stedfeldt, S. F.

FEEDER FOR STAMP MILL.—Charles C. Stevenson, Gold Hill, Nev.

ELASTIC TRUSS.—G. A. Tyer and W. J. Horne, S. F. TRADEMARK.

YEAST POWDER.—Henry E. Bothin, S. F.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.  
NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

BORING AND EXCAVATING APPARATUS.—James Manning and Jerome Haas, Stockton. This is an improved method and apparatus for boring wells, excavating and dredging. A cylinder with its lower end open is taken and the edge sharpened. A little above the bottom the cylinder is divided by a diaphragm, in which is an upward lifting valve. A short distance above the diaphragm is a solid diaphragm, and in the upper part of the cylinder above this diaphragm is a weight or hammer which has a length of stroke in the upper part of the cylinder, so that it can be raised and allowed to drop on the diaphragm for working it into the earth. The hammer is guided in the upper part of the cylinder, and stops prevent it from coming entirely out of the cylinder when hoisted. In operation this apparatus is suspended by a rope from the end of a derrick or hoisting apparatus, the rope being attached to the weight. The sharpened lower edge of the cylinder is then allowed to rest on the ground, and the hammer raised and dropped suddenly, and thus by a succession of blows drive the open ended cylinder into the earth. The valve allows the air and water to pass above the diaphragm as the cylinder is driven into the earth, so that when the lower or earth chamber has been filled, the entire cylinder can be hoisted out and emptied, the water above the valve serving as a packing to keep the valve tight and the consequent vacuum above the earth formed by the weight of material in the cylinder, serving to retain the load. If the hole does not contain enough water, it is supplied from the surface, for which purpose a hole is made in the diaphragm, so that when water is poured in it will pass down and rest on the valve. When the cylinder is filled the hammer is hoisted to the stops, and a further hauling on the rope hoists out the entire cylinder and load.

LINING FOR DITCHES AND FLUMES.—J. P. Culver, S. F. This is a method of constructing flumes to carry water for various purposes, and a means of lining irrigation and other ditches, so as to keep them water-tight and preserve them from the attacks of burrowing, water or other animals. It consists in the employment of burlaps or other fibrous material, which are treated with asphaltum or other carbonaceous substance, with or without a curving or backing of thin wood or veneer. The object is to prevent the loss of water by working into the banks or otherwise, to prevent the ravages of burrowing animals which might rupture or destroy the banks or ditches, and also to protect the earth of the banks from being washed by rapid currents, so as in effect to allow the passage of a greater quantity of water without injury to the earth-work.

A RAILROAD smash-up occurred on Monday morning last, on the California Pacific road near Elmira station. A culvert had been hurried during the preceding night, and, as the early train came rushing along the rails were still in place, but their supports had burned away. The locomotive jumped the chasm safely, but the tender, baggage, smoking and first passenger cars plunged in. Fortunately only one man was injured and that not very seriously. Mr. Hopkins, of Dixon, was the unfortunate, or rather we might say the fortunate man, who ran such a risk and escaped with merely a slight scalp wound.

BRIGHT things can never die, and neither can Morse's memory, for the millions of loved ones he has transferred to cardboard for the people, will be an everlasting monument to him and his art. See his specimens at No. 417 Montgomery street.

### General News Items.

A NEW gas franchise for this city has been petitioned for before the Board of Supervisors. An order has been made for consideration, in which it is required that a certain amount of work must be done within a given time, and gas furnished to consumers at \$2.50 per thousand.

TURKEY is putting out a new loan. If there is anything the Turk delights in, it is in borrowing money of the Christian dogs, and paying them when he is able. And although he is never able, he, nevertheless, gets the money all the same of Johnny Bull, who still desires to keep the Turk between himself and his Russian neighbor.

FRESH WATER FOR VESSELS.—Several ship owners not liking the present monopoly and high price of water for shipping along the city front, have made arrangements for the little steamer *Hiawatha* to supply water to the ships in the harbor. The water will be obtained in Marin county, and is said to be very clear, sweet and fresh.

A FATAL EMBUE.—The prisoners in the shoe shop of the State prison at Carson, Nevada, made a strike for liberty a few days since, carrying their keeper before them to ward off the bullets of the guard. The plucky keeper commanded the guard to fire and not mind him. The command was thrice repeated before the guards were willing to obey, but when they did it told with fatal effect on the ringleader, and a severe flesh wound through the arm of the keeper. The prisoners thereupon gave in.

### Thanksgiving Proclamation by the President.

WASHINGTON, October 29th.—The following was issued this afternoon:

By the President of the United States of America.—Proclamation.

The completed circle of summer and winter, seed-time and harvest, has brought us to the accustomed season at which we as a religious people celebrate, with praise and thanksgiving, the enduring mercy of Almighty God. This devout and public confession of the constant dependence of man upon the Divine Father for all good gifts of life and health, of peace and happiness, so early in our history made the habit of our people, finds in the survey of the past year new grounds for its joyful and grateful manifestation. In all the blessings which depend upon benign seasons, this has indeed been a memorable year. Over the wide territory of our country, with all its diversity of soil and climate and products, the earth has yielded a bountiful return to the husbandman. The health of the people has been blessed by no prevalent or wide-spread disorders; no great disasters of shipwreck upon our coasts, or to our commerce on the seas, have brought loss or hardships to merchants and mariners, and clouded the happiness of the community with sympathetic sorrow. In all that concerns our strength and peace and greatness as a nation; in all that touches the permanence and security of our Government and the beneficent institutions on which it rests; in all that affects the character and dispositions of our people and tests our capacity to enjoy and uphold the equal and free condition of society—now permanent and universal throughout the land—the experience of the last year is conspicuously marked by the protecting providence of God, and is full of promise and hope for the future. To God, therefore, for a sense of these infinite obligations to the Great Ruler of the universe and events, let us humbly ascribe it to our own faults and frailties, if any degree of that perfect concord and happiness, peace and justice, which such great mercies should diffuse through the hearts and lives of our people, do not altogether and always and everywhere prevail. Let us, with one spirit and one voice, lift up praise and thanksgiving to God for His manifold goodness to our land and His manifest care for our nation.

Now, therefore, I, Rutherford B. Hayes, President of the United States, do appoint Thursday, the 29th day of November next, as a day of National Thanksgiving and Prayer, and I earnestly recommend that, withdrawing themselves from their secular cares and labors, the people of the United States do meet together on that day, in their respective places of worship, to give thanks and praise to Almighty God for His mercies, and to devoutly beseech their continuance.

Position Wanted.—A Mining Engineer, with best California references, well experienced in tunneling and shaft sinking, good will-man, competent assayer and surveyor, desires a position with some mining company, to assist a mining or hydraulic engineer, assayer, etc. Address, M. E. this office.

E. M. DENNY will please address Dewey & Co., San Francisco, immediately, without fail.

### LEATHER.

[WHOLESALE.]

WEDNESDAY M., October 30, 1877.

Sole Leather, heavy, lb.	26 @ 23

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

### California and Oregon Land Company.

Location of principal place of business, San Francisco, California. Location of works, Jackson County, Oregon. Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of October, 1877, an assessment No. 1, of thirty-five cents per share was levied upon the capital stock of the company, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 418 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-eighth day of November, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Monday, the twenty-fourth day of December, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Secretary.  
Office, 418 California Street, San Francisco, California.

### Fresno Quicksilver Mining Company.

Location of principal place of business, San Francisco, Cal. Location of works, Mexico, Fresno county, Cal.

Notice.—There is delinquent upon the following described stock, on account of assessment No. 5, levied on the nineteenth day of September, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

Names	No. Certificate.	No. Shares.	Amount.
Brown, W. E.	280	7000	\$140 00
Brown, W. E.	307	7000	140 00
Friedberg, Chas.	51	300	6 00
Friedberg, Chas.	217	100	2 00
Friedberg, Chas.	309	400	8 00
Haley, John J., trustee.	37	1000	20 00
Haley, John J., trustee.	83	1000	20 00
Haley, John J., trustee.	00	680	13 60
Haley, John J., trustee.	285	4320	86 40
Haley, John J., trustee.	327	7000	140 00
Robinson, E. J.	200	500	10 00
Robinson, E. J.	201	500	10 00
Robinson, E. J.	320	1000	20 00
Robinson, E. J.	329	655	13 10
Robinson, Clara M.	204	25	5 00
Robinson, Clara M.	322	25	5 00

And in accordance with law, and an order of the Board of Directors, made on the nineteenth day of September, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, 414 California Street, San Francisco, California, on Tuesday, the thirteenth day of November, 1877, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. R. WEGENER, Sec'y.  
Office, 414 California Street, San Francisco, Cal.

### Merced Mining and Water Company.

Principal place of business, San Francisco, Cal. Location of works, Mariposa Co., Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the second day of October, 1877, an assessment (No. 1) of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company

## Iron and Machine Works.

**PACIFIC ROLLING MILL CO.,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Con-  
necting Rods, Car and Locomotive  
Axes and Frames,

Hammered Iron of Every Description and Size  
Orders addressed to PACIFIC ROLLING MILL  
COMPANY, P. O. Box 2032, San Francisco, Cal., will re-  
ceive prompt attention. Office: 16 First Street.  
The highest price paid for Scrap Iron.

THOS. PENDERGAST.

HENRY S. SMITH

**ÆTNA IRON WORKS,**

MANUFACTURERS OF

**IRON CASTINGS**

and **MACHINERY**

OF ALL KINDS.

mont Street, Bet. Howard and Folsom

SAN FRANCISCO.

**SHEET IRON PIPE.**

**Risdon Iron and Locomotive Works**

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM  
PIPE, of any size and for any pressure, and contract to  
lay the same where wanted, guaranteeing a perfect work-  
ing pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special pat-  
terns for Mining Cars. These small wheels are made of  
the best Car Wheel Iron, properly chilled, and can be  
fitted up with the improved axle and box—introduced by  
this company, and guaranteed to outlast any other wheels  
made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

**PHELPS  
MANUFACTURING COMPANY.**

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle  
Work, Car Frames and Bolts, Machine  
Bolts, Set Screws and Tap Bolts,  
Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.  
HOT AND COLD PRESSED HEXAGONAL AND  
SQUARE NUTS, WASHERS, BOLT ENDS,  
TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

**SACRAMENTO BOILER WORKS,**

37 Fremont St., cor. Mission, S. F.

**HALL & KELSHAW,**

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks,  
Hydraulic Pipe, Oil or Water Tanks, Ore and  
Water Buckets, Gasometers, Girders, Bridges  
and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.  
Repairing promptly attended to at the  
lowest possible terms.

**GOLDEN STATE & MINERS' IRON WORKS.**

Manufacture Iron Castings and Machinery  
of all kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board AMALGAMATORS,

Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

**CALIFORNIA BRASS FOUNDRY.**

No. 125 First Street, Opposite Minna,  
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt  
Metal Castings, Brass Ship Work of all kinds, Spikes,  
Sheathing Nails, Rudder Braces, Hinges, Ship and Steam-  
boat Bells and Gongs of superior tone. All kinds of Cocks  
and Valves, Hydraulic Pipes and Nozzles, and Hose Cou-  
plings and Connections of all sizes and patterns, furnished  
with dispatch. PRICES MODERATE.  
J. H. WEED. V. KINGWELL.

**California Machine Works,**  
119 BEALE STREET, SAN FRANCISCO.

**BIRCH, ARGALL & CO.,**

Builders of QUARTZ, SAW AND FLOUR MILLS,

Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORES,  
And General Machinists.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

IMPROVED PORTABLE  
**Hoisting Engines,**  
For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery

**PACIFIC IRON WORKS,**

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

**RANKIN, BRAYTON & CO.,**

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY  
INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS,  
CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES,  
FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES,  
RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES,  
SUGAR MILL MACHINERY, WATER WHEELS, Etc., ALL OF THE  
LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster  
Rock Drills and Air Compressors heeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

**UNION IRON WORKS,**

SACRAMENTO CAL.

**ROOT, NEILSON & CO.,**

MANUFACTURERS OF

**STEAM ENGINES, BOILERS AND ALL**

Kinds of Machinery for Mining Purposes.

Flouring Mills, Saw Mills and Quartz Mills Machinery  
constructed, fitted up and repaired.

Front Street, Between N and O Streets,  
SACRAMENTO, CAL.

**THOMPSON BROTHERS,  
EUREKA FOUNDRY,**  
Light and Heavy Castings of Every De-  
scription Manufactured.

Sole Proprietors and Manufacturers of

**Lynch's Ventilating and Illuminating Tile,**  
The Only Illuminating Tile Manufactured for Light-  
ing Cellars, Basements and Dark Rooms which pro-  
vides proper ventilation for such places  
129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

**STEAM ENGINES AND BOILERS**

Of all sizes—from 2 to 60-Horse power. Also, Quartz  
Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron  
Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

**McAFEE, SPIERS & CO.,**

**BOILER MAKERS AND  
GENERAL MACHINISTS,**

Howard between Fremont and Beale Sts., San Francisco.

## Metallurgy and Ores.

**JOHN TAYLOR & CO.,**

Importers of and Dealers in

**ASSAYERS' MATERIALS,  
CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.**

512 & 518 Washington St., San Francisco.

We would call the special attention of Assayers, Chem-  
ists, Mining Companies, Milling Companies, Prospectors,  
etc., to our stock of Clay Crucibles, Muffles, Dry Caps,  
etc., manufactured by the Patent Plumbago Crucible  
Co., of London, England, for which we have  
been made Sole Agents for the Pacific Coast. Circulars  
with prices will be sent upon application.  
Also, to our large and well adapted stock of

**Assayers' Materials & Chemical Apparatus,**

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast.  
Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application.

**JOHN TAYLOR & CO.**

**THOS. PRICE'S**

**Assay Office and Chemical  
Laboratory,**

524 Sacramento St., S. F.

Deposits of bullion received, melted into bars, and re-  
turns made in from 24 to 48 hours.

Bullion can be forwarded to this Office from any part of  
the interior by Express, and returns made in the same  
manner.

Careful Analysis made of Ores, Metals, Soils, Waters,  
Industrial Products, Etc. Mines examined and reported  
upon. Consultations on Chemical and Metallurgical  
questions.

**Nevada Metallurgical Works,**

No. 23 STEVENSON STREET,

Near First and Market Streets.

Ores worked by any process.

Ores sampled.

ASSAYING in all its branches.

Analysis of Ores, Minerals, Waters, etc.

WORKING TESTS MADE.

Plans furnished for the most suitable process  
for working Ores.

Special attention paid to Examinations of  
Mines; plans and reports furnished.

E. HUHN,

C. A. LUCKHARDT,

Mining Engineers and Metallurgists

Most complete book of its kind ever published. Gives  
correct measurement of all kinds of lumber, logs and  
plank by Doyle's rule cubical contents of square and  
round timber, stave and heading bolt tables, wages, rent,  
board, capacity of cisterns, cord-wood tables, interest, etc.  
Standard book throughout United States and Canada.  
Ask your bookseller for it, or I will send one for 35 cents,  
post-paid. G. W. FISHER, P. O. Box 233, Rochester, N. Y.

SOLD ON THE PACIFIC COAST BY

**DEWEY & CO., San Francisco,**

And mailed post-paid on receipt of 35 cents in currency  
or postage stamps.

## Machinery.

**SNYDER'S**

**LITTLE GIANT STEAM ENGINE.**

For Farmers, Machinists, Printers and all requiring  
light power. Sizes from one to six horse-power. Prices  
for engine and boiler complete, from \$150 to \$450. We  
make the strongest boiler and the best engine in the  
country. Call at our factory or send for free illustrated  
and descriptive catalogue.  
SNYDER BROS., 94 Fulton Street, N. Y.

## The Ingersoll Rock Drill

Is Extensively Used in the East and

**TAKES THE PLACE OF ALL OTHERS,**

Wherever introduced, because it can be run with less  
power, labor and repairs, and do more work than any  
other Drill in the market. It has but few parts, is easily  
handled, being light, and has AUTOMATIC FEED, which  
saves labor. WE ASK FOR TRIAL AGAINST ANY  
COMPETITOR. For particular information regarding  
Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

(Room 10,) 320 Sansome Street,

## THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2 1/2 cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61 1/2

In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Exchequer mill, Alpine Co., Cal. For further infor-  
mation, apply to

D. J. O'HARRA,

Reno, Nevada.

## BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER.

J. C. Sanderling, Sole Ag't Pacific Coast  
51 Fremont Street, S. F.

**TIRRELL'S UNDERGROUND METRE.**

**GAS MACHINES**

If you are examining Gas Machines it will be a great  
mistake not to send for the circular of the simplest and  
most effective Gas Machine ever invented.

## W. S. BLUNT'S Universal Force Pumps.

Secured by Letters Patent.

These Pumps have enormous power, and are for the house or for out-door wells of any depth. They are constructed with special regard to strength, ease of working and durability. They can be immediately changed from lift to force pumps, and the air chamber can be revolved, so as to allow the handle to work at any desired angle with the spout. Having close tops, they cannot be tampered with.

The above cuts show the style of the two Principal Pumps kept in stock, both of which

CAN BE FITTED-UP EITHER FOR SURFACE OR DEEP WELL USE.

FOR FULL PARTICULARS SEND FOR CIRCULAR TO

**DUNHAM, CARRIGAN & CO.**

PACIFIC COAST AGENTS,

SAN FRANCISCO.

## To Mill and Mine Owners.

Having made arrangements with competent and reliable parties in Washington City, by which we will be able to secure prompt and careful attention to our business, we are now prepared to assist Mill and Mine, Canal and Ditch owners in securing patents for their lands, mines and claims, in addition to our former line of patent business.

Many who are acquainted with the manner in which this business has heretofore been conducted, (with or without assistance by local attorneys,) will see at once the great advantage of patronizing an establishment that is thoroughly organized and has its representatives in Washington to look after and prosecute their applications before the Commissioner of the General Land Office. The business on this Coast will be attended to by JOHN L. BOONE, Esq., Attorney-at-Law, one of the members of this firm.

Correspondence from persons desirous of securing patents for Lands, Mines, Mill Sites, Canal and Ditch property, promptly attended to.

**DEWEY & CO.**

Solicitors of Patents for Lands, Mines and Inventions,  
MINING AND SCIENTIFIC PRESS OFFICE,  
No. 202 Sansome St., S. F.

SANTA CLARA, CAL., April 6th, 1875.  
Messrs. Dewey & Co.—Gents:—We have just received Patent No. 160,535, for J. T. Watkins & Co.'s Mammoth Road Grader, which was patented through your Agency. It is the neatest and best that we have ever received. We feel proud of it and thankful to you for the care and attention that you have given it, and when we have anything to do in that line of business, we will surely give you a call. Very respectfully,  
J. T. WATKINS & CO.

Engraving done at this office.

"More than Pleased."

OSCEOLA MINE, NEVADA CO., CAL., April 19th, 1877.  
Messrs. Dewey & Co.—Gentlemen:—We are more than pleased with your professional ability in the management of our application, and will always recommend your competency as Patent Attorneys, and your honorable and gentlemanly dealings with clients. Truly and respectfully yours,

569 MISSION STREET, below Second, S. F.

Patent Mining & Locomotive Head-Light.

Medal Awarded at 12th Industrial Exhibition of 1877 at S. F. Hall and Show Window Reflectors of Corrugated Tin and Silvered Corrugated Glass, Sectional, Globe and any Style of Ornamental Lamps for Hotels, Private Residences, Churches, etc. Ship, Railroad, Street Car, Coach, etc.

SPINNING OF SHEET METAL TO ORDER.  
Send for further information.

HIGHLY IMPORTANT.  
GOLD AND SILVER PLATING

AT THE  
SAN FRANCISCO PLATING WORKS,  
653 and 655 Mission Street, San Francisco,  
Between New Montgomery and Third.

THREE FIRST PREMIUM MEDALS  
Awarded at the last three Fairs of the Mechanics' Institute.

Every description of goods (including table ware,) from which the silver is worn, repaired and replated in the best manner.

Watches, jewelry, etc. plated with gold in the finest manner. A large assortment of new styles of Plated Ware and Cutlery on hand and for sale at lowest rates.

New and elegant styles of Door Plates and Numbers furnished. Gold-saving Silver-plated Amalgamating Plates for Miners' use, furnished to order.

EDWARD G. DENNISTON, Proprietor.

Mining and Assaying Offices,  
504 Washington St.,  
SAN FRANCISCO.

Mention where you saw this advertisement.

The Large Circulation of the Mining and Scientific Press extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

Thousands of mothers have placed on record their belief, that for all complaints of the stomach and bowels to which children are subject,

Tarrant's Effervescent Seltzer Aperient is the most unexceptionable of correctives and alternatives. The reasons for this belief are obvious. It forms a delicious and most refreshing draught, relieves the bowels of all acid matter without pain, allays fever, induces sleep, strengthens digestion, neutralizes acid in the stomach, cures flatulency, acts as a gentle stimulant, tones the tender nerves, and never grieves the patient. What family can afford to be without such a resource in sickness? Sold by all druggists.

# MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,  
Patent Solicitors.

SAN FRANCISCO, SATURDAY, NOVEMBER 10, 1877.

VOLUME XXXV.  
Number 10.

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at the offices in this city:

The circulation of air in the Hale & Norcross mine is now excellent.

The Chollar-Norcross-Savage shaft is now 1,744 feet deep.

The crosscut on Savage north line has been discontinued on account of water.

Work has been resumed on the Mexican and Ophir joint winze.

The dump on the incline station, 1700-foot level of the Ophir, to receive California ore, has been completed.

The average assays of the ore in the 230-foot level of the Crown Point, are from \$20 to \$40 per ton.

The volume of water from the face of the tunnel of the South Barcelona continues as large as ever.

The Manhattan letter of the 2d says: From the 26th of October to the 31st the mill reduced 106 tons, the assay value of which is \$16,965.34. Of this amount, \$1,338.16 was from custom ores, and the remainder \$15,627.18, from the Frost and Curtis shafts. The mill has reduced for the month of October 682½ tons, the assay value of which is \$131,101.92, of which amount \$14,720.30 comes from custom or purchased ores. At the Curtis shaft sinking has been resumed on the Curtis winze, with very little water to interfere. The ledge is large, but carries very little pay ore.

In the Eureka Con. mine the winze on the 10th level has been sunk a distance of 31 feet, and still remaining in ore. The ore body on this level is looking first rate and continues to improve in size, etc., as developments are advanced. There has been extracted during the week some 1,600 tons of ore, one-half of which was taken from the 10th level. There has been delivered at the furnace 1,411 tons of ore, which produced 310½ tons of bullion.

Crosscutting was commenced last week on the 248-foot level of the Bodie.

In order to be sure and not flood the 1900-foot level, the Superintendent of the Gould & Curry will drill west to a point where the main incline will strike the level, and if no water is encountered, they will follow up the drill hole and commence an upraise to meet the main incline.

## Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last, Prof. Davidson in the chair. Among numerous contributions, Dr. Kellogg presented acorns, leaves, etc., of a new species of oak which has lately been discovered in Lower California, by a gentleman named Dunn, and called after him, *Ivercus Dunnii*. Dr. Kellogg described the newly found plant at length. Dr. Stout, while complimenting the zeal and culture which leads to the discovery of new matter, or rather the new discovery of matter, objected strongly to the fashion which has so long obtained of naming astronomical or natural objects after the person who first points them out to the world, and found fault, in fact, with all personal scientific nomenclature.

Dr. Saxe, although agreeing to a certain extent with the previous speaker, thought that to the discoverer belongs the spoils, at least so far as recognition of his name is concerned.

Prof. Davidson read an interesting paper on improvements in geodetic instruments. He also read a short paper on the rotation of Saturn.

Dr. A. M. Saxe, of Santa Clara, presented a new species of climbing vine, which Dr. Kellogg described as the *Luffa spongiosa*, or vegetable sponge; the inner portion of the gourd fruit consisting of a dense mass of tough, interlaced network of fibers, used as a sponge.

Dr. Kellogg proposed an amendment to the Constitution, which would permit the admission of women to membership. The amendment was considered unnecessary, as, in the opinion of all present, equal privileges are already extended by the Constitution to persons of both sexes.

## On the Death of Leverrier.

At the meeting of the Academy of Sciences, on Monday evening last, Prof. Geo. Davidson, made the following remarks on the death of Leverrier, the eminent astronomer: "On the 23d of September there passed away the life of one of the greatest of modern astronomers; and by a curious coincidence, upon the thirty-first anniversary of the discovery of the planet Neptune. The marvelous extent and great utility of Leverrier's labors throughout a long series of years can only be fairly estimated by an exhaustive resume of his investigations. There is, possibly, not a dozen persons who can thoroughly appreciate the breadth and depth of his researches and their eminently practical application in modern mathematical astronomy. Last year the Royal Astronomical Society, under the Presidency of Prof. Adams, presented to Leverrier a second gold medal, a reward which is regarded as the highest tribute that that learned society can offer of their appreciation of his work. In 1868, 1848 and 1846 he had also received medals and testimonials from the Royal Society and the Royal Astronomical Society, and, in 1875, the University of Cambridge, at the suggestion of Prof. Adams, his so-called rival in the discovery of the planet Neptune,

## The "Devil's Gate."

The term "gate" has on this coast frequently been applied to mountain defiles or narrow gorges having precipitous sides. Thus the entrance to the Bay of San Francisco has been named the Golden Gate. There being, on the old overland stage route, in the State of Nevada, two passages of this kind called, because of their relative positions, the East and the West Gate. The point where the Colorado river flows between two great crags, tinted with many delicate colors, has been aptly called the "Porphyry Gate," these passage ways receiving such qualifying prefixes as their natural features or other peculiarities may suggest. The defile represented by the accompanying cut has been very properly designated the "Devil's Gate," because of its rough and scraggy appearance. It forms a part of Gold canyon, and constitutes a point on the boundary line between Lyon and Storey counties in the State of Nevada. Its locality is three miles below the town of Gold Hill, four miles below Virginia City. The view represented in the cut supposes the spectator to be looking up the canyon towards the west, the high ridge dimly seen in the background being the Washoe or Mount Davidson

THE DEVIL'S GATE, WASHOE.

conferred upon him the degree of LL. D. But the most valued recognition that could be offered by English astronomers to his great merit was the adoption by the Nautical Almanac of his tables for the computation of the places of the planets. No man was better fitted than Adams to appreciate the vastness of the more recent works which Leverrier undertook and accomplished in elucidating the theories of the mutual disturbances of the group of larger planets—Mercury, Venus, the earth and Mars. In 1872 the programme of work he proposed for himself was, in the language of Adams, 'appalling,' and, when communicating his statement, upon the presentation of the last gold medal, Adams says: 'That any one man should have had the power and the perseverance required thus to traverse the entire solar system with a firm step, and to determine with the utmost accuracy, the mutual disturbances of all the primary planets which appeared to have any sensible influence on each other's motions, might well have appeared incredible if we had not seen it actually accomplished.' It is hardly possible to avoid the painful conviction that labors such as these have shortened the life of one of the few really great astronomers of the age. The too tensely drawn cord must strand and finally yield; the laws governing health are as immutable as the laws governing the planets. Learned societies throughout the world will mourn their late associate. Those devoted to the object of his special duties lose from their ranks a leader among leaders."

REPRESENTATIVE PAGE has introduced a bill appropriating \$100,000 for the erection of a new Postoffice building at Sacramento.

Range of mountains along the side of which the Comstock lode is situated. The hamlet just below the "Gate" is Silver City, a place that has grown considerably since this view was sketched. The indentation opposite the lower end or the town shows the entrance to American canyon. The hills along Gold canyon rise to a height of 400 or 500 feet, the sides of the "Devil's Gate" being about 200 feet nearly perpendicular, the bottom of the passage being barely wide enough for a wagon road.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from the prominent mines have been as follows: Con. Virginia, Oct. 31st, \$188,531.47; California, 31st, \$198,579.10; Modoc, 30th, \$6,984.22; Alps, Nov. 1st, \$1,600; Gold Hill, Idaho, \$11,290; Northern Belle, 3d, \$5,617.21; Gila, 1st, \$10,774; Modoc, 1st, \$8,502.58; Endowment, 3d, \$2,193.08; Arizona, 3d, \$2,323.17; California, 3d, \$236,794.55; Con. Virginia, 3d, \$107,453.05; Northern Belle, 1st, \$5,242.19; Day, Oct. 31st, \$22,038; Modoc, Nov. 3d, \$3,960.39; Grand Prize, 5th, \$22,500; Leopard, 5th, \$3,900; Gila, 4th, \$10,771.98; Northern Belle, 3d, \$5,665.95.

A DECIDED improvement has taken place in winze sinking on west ore spur, 800-foot level of the Justice. Winze sinking on east ore spur presents a favorable appearance. This winze is entirely free from water and situated on 800-foot level.

THE Spanish government is negotiating with bankers for a loan of 30,000,000 pesetas. The army estimates show a reduction of 3,000,000 pesetas.

## Paper Stock and Manufacture.

The difficulty of finding an efficient substitute for rags in the manufacture of paper has long been felt and acknowledged in all parts of the civilized world. Large rewards, we believe, have been offered for the discovery of any new and really practical material. The British government has ransacked all India, and the London Times and New York Herald have spent large sums of money in the search of some suitable material in Africa. Scores of patents have been taken out for the manufacture of paper from straw, hop vines, rushes, esparto grass, and various woody fibers, such as poplar, beech, birch, etc.; but all have proven failures in a greater or less degree, and can be utilized for good paper only by the addition of a large amount of rag or manila stock, which is very expensive.

What is wanted is some vegetable matter, practically inexhaustible, which can be had at a low price and which can be made into a good paper without any or at most with very little admixture of rags. Judge Geo. B. Walker, of this city, seems to have found this desired material in the *Yucca draconis*, better and more popularly known as the giant cactus of the Mohave desert. This plant, though eluded by hotanists as a grass, nevertheless grows to large proportions as a tree, and exists on the desert aforesaid in large forests, extending hundreds of miles from the western extremity of the desert southwardly and eastwardly through San Bernardino county and Arizona into Mexico. The supply is absolutely inexhaustible, even though all the world should come for it. Moreover the tree grows rapidly from the roots of the living tree when the parent stem is cut down. It is now being gathered along the line of the railroad and delivered to the cars for some \$2 or less per cord. The entire body of the tree, except the bark, is worked up into paper, with a loss of not more than 25% or 30%.

The parties now working it are limited in means, but have a pulp mill near the desert, where the wood is reduced to a fiber and shipped to the Lick mills, near Santa Clara, which have been leased, and where the fiber is converted into paper. The manufactured article sells readily in this city at good prices. So far, manila paper only has been manufactured, and is used for wrapping purposes by dry goods dealers and others, and for paper bag manufacture.

We understand that arrangements are nearly perfected for throwing the business into a joint stock company, with large capital, for the erection of mills and procurement of more extensive and superior machinery to that which is now used. Nothing but means is wanted to make this one of the most important and lucrative enterprises on the Pacific coast. We understand the gentlemen having it in hand have both faith and money, and are only waiting the expected arrival from the East of the gentleman who is to make the necessary estimates for the capital and the drawings for the machinery needed. So we may soon hope to see all the paper used on this coast manufactured in our midst.

Experiments have been made which go to show that this tree will produce a much better material for newspaper than the mixed materials which are now being used in the manufacture of paper for the large New York dealers, and probably at a price which will admit of its transportation hence to New York. If such should be the case, there is no fixing the limit to the extent to which this business may be carried.

THE biennial report of the Surveyor General just filed with the Governor, shows that the area of the State of California amounts to 100,500,000 acres. The fees collected by the Surveyor General from December 6th, 1875, to August 1st, 1877, amount to \$16,297.50. The fees of the Register of the State Land Office for the same period amount to \$6,147.75.

THE Central Pacific Railroad Company planted 300,000 trees, chiefly eucalyptus, along the line of their road last season, and they have ordered over 700,000 more, which will be set out the coming season.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### Harrisburg District.

EDITORS PRESS:—My attention has just been called to an article in your issue of September 15th, 1877, copied from the *Pioche Record*, under the caption of "Utah," as follows:

"We understand that Louis Janin, President of the Leeds company, intends sending to Silver Reef a diamond drill, for the purpose of prospecting the mines owned by that company. As the ledges there all lie flat, that will be the least expensive way in which to tell what the company have, etc."

Now, inasmuch as the above article is calculated to injure that mining district, and the poor hard-working miners who have spent their last dollar in developing their claims, and are now inviting San Francisco capital to that section to help them out by putting up reduction works, mills, etc., to reduce the ore which they have in sight, I would ask the privilege of correcting the statements in said article through the columns of your valuable paper.

1. The reef above referred to is known as "White Reef," and not "Silver Reef," as stated by Mr. Janin, and it is on this reef that most of the mines are located in the Harrisburg district, including the Leeds.

2. The Leeds company have already an incline shaft over 900 feet deep from the crest of the reef, and in good paying ore all the way, and improving as they go down.

3. None of the strata or ore veins in or on this reef lie flat, but, on the contrary, they all have a uniform pitch of about 40°.

The reasons Mr. Janin had for making the statements accredited to him in said article, which are wholly false, are best known to himself, and the only result which would follow, providing any persons could be found who would believe him, would be to prejudice outsiders against the district, thus enabling him and the unscrupulous bears who are interested with him to "gobble" up everything in that section of the country. Give the miners a chance, and do not allow them to be squeezed out by such operations.

A. H. PARKER,  
Mining Engineer.

San Francisco, Nov. 1st, 1877.

WEIGHT OF ONE CUBIC FOOT OF GOLD.—EDITORS PRESS:—As there has been considerable discussion among the miners around here as to the weight of one cubic foot of gold, we have agreed to have you inform us through your valuable paper.—MINER, Golden Willow Bar, Plumas county.

[One cubic foot of gold weighs 17,502 ounces troy, and is worth, if pure, \$361,808.64. The avoirdupois weight of a cubic foot of gold is 1,200.21 pounds.—EDS. PRESS.]

### The Silver Caves of Peru.

Henry Sewell, in the *London Mining Journal*, thus describes these curious deposits: "The mineral caves of Huallanca are situated at 14,700 feet above the level of the sea. The inspection of these mines was a very trying affair, the rarification of the air causing an extraordinary increase in the pulsation of the heart, and making it dangerous to move about except with great care. These silver mines are situated in the heart of a coal formation which has been upheaved by the outburst of porphyry, forming immense backbones. The stratification is standing on its beam ends, and almost perpendicular. The class is a new tetrahedrite, containing about 800 ounces to the ton, and about 150 yards to the left is the first coal seam from where the smith orders his coal to be extracted. The ores containing 100 to 130 ounces to the ton are thrown over the dumps, their carriage to the coast being too expensive. I recommended the owners to collect these poorer ores and to smelt them in a reverberatory furnace into regulus, thus raising them about 600 ounces to the ton. The ore is found in the shaly portion of the formation as well as in the sandstone. In the latter it is found in a most singular condition—in huge 'vugs' or caves, many of these being as much as 25 to 30 feet long, and about an equal size in depth. These caves are coated with from two inches to three inches of argentiferous ores, and millions of crystals of tetrahedrite are destroyed by the picks of the miners, who break down the ore in that manner. Some of these caves have produced as much as £30,000 in a single day. The way they are discovered by the native miners is also singular. They follow for months a thin little cleavage of about an eighth of an inch. This contains chalcidony, and they drive horizontally and at an incline of 45° in order not to miss them. They vary in size from a few feet to the above."

SOLUTION FOR BRIGHTENING SILVER.—Cream of tartar, 30 parts; sea salt, 30; sulphate of aluminum and potash, 30; water, 1,500. An extremely brilliant color can be given to silver-ware by boiling it in this mixture.

### The Legislature of 1877-8.

In a few weeks the Legislature will assemble at Sacramento. The session of 1877-8 will doubtless find its attention claimed by some of the most important issues which have lately fallen to the lot of people's representatives to determine. Questions will arise which will require the closest study, the widest knowledge, and the most unswerving integrity for their true adjustment. These qualities we trust the new Legislature will give early evidence of possessing, and it will quickly win the people's support and gratitude. As Legislators approach their work they should be sure that they understand the wishes and the best interests of those they represent. We have no doubt that many errors in legislation have been the result of a lack of understanding of what the people really desired, and Legislators have been led into unsuspecting support of private interests which were thrust upon their attention rather than the general good which was obscured. Therefore the people owe a duty to their representatives in the plain expression to them of things their best interests demand. If the people wink at evils which are coming forward to the public detriment, they cannot blame their representative if he does not always detect the wrong. Our columns will be open during the session for the expression of truth concerning legislative topics, which pertain to the industries which we represent. Much information, coming from the people, will be spread out so that the people's representatives may learn the sentiment not only among those whom they immediately represent, but of the workers throughout the State. On the other hand we shall watch the proceedings at Sacramento closely and furnish condensed statements of all matters affecting the public good, and the especial industries we serve. In order that all readers may have early information of the men in whose hands their interests will soon be placed, we print below the complete list of the members of both houses and the political faith to which they are accredited:

#### Senators.

### Dangers of Coal Mining.

The following extract from the report of Samuel Gay, one of the mine inspectors for the anthracite coal fields of Pennsylvania is taken from *Seward's Coal Trade Journal*:

Another prolific source of danger in mining anthracite coal arises from the large amount of powder used for mining purposes, as nearly all the coal has to be blasted. One keg of powder, weighing 25 pounds, is usually used for every 50 tons of coal sent to market.

The accidents which occur from the use of powder in the mines are due to various causes, and the miner is endangered in several ways, but the greatest danger arises from not using the precautions which are necessary in handling so dangerous an explosive. The mode generally in practice with the miners in making up the powder into cartridges for the purpose of blasting is extremely reckless. Generally they hold the keg containing the powder under one arm and the cartridge in the other hand, with their lamps hanging on their heads; and, besides, almost always, this work is done in some small heading, where there is not room enough to turn around even when on their knees.

Another source of danger arising from the use of powder is when a cartridge is being inserted into the hole which has been bored to receive it. The cartridge is pierced with what the miners call a needle, which is made of iron, varying from three to five feet in length, and about five-eighths of an inch in diameter at the large end, drawn on a regular taper, to a fine point. Should this needle be driven to the back of the hole while inserting the charge or shot of powder, there is danger of striking some flinty or fiery substances, which are found to a greater or less extent in all minerals, but more so in anthracite than in bituminous coal. There is also danger in the process of tamping the hole, which is also done with an iron tamping bar, unless great care is taken not to break the cartridge while inserting it.

In either of the above cases there is danger of a premature explosion of the powder in the hole, and oftentimes the most fearful accidents that can befall a human being occur from them. Sometimes the results are fatal, and at other times miners are blinded or injured and named for life.

There is also another source of danger, and probably the greatest of all arising from the use of powder in blasting. It is from shots which fail to explode at the time generally allowed by the miner for the match to ignite the powder in the squib, although this source of danger may have been somewhat lessened within the last few years by the invention of the "Daddow's patent squib and match combined," which is now used very extensively in the anthracite coal mines; nevertheless there is still a large percentage of accidents occurring from this source. The length of the match which is connected with the squib is regulated according to the distance the miner has to retreat to a place of safety, and it is upon his practical judgment alone that he must rely to measure the time necessary to be allowed. Through various causes the match oftentimes fails to ignite the powder in the squib, as soon as the miner thinks it should. (This is often the case, as a large percentage of the holes cut small springs of water in passing through the various partings or slips which run at all angles through the coal seams.) Upon the impulse of the moment, from fear of losing the powder and also the labor of boring the hole out again, he rushes back to the face of his working place, without consulting his own safety, to apply another squib or match as the case may require, apparently unconscious that the jaws of death are almost ready to swallow him. Nevertheless he knows the danger, if a practical miner, for he is aware that these matches burn very freely up to near the powder and then the fire almost burns out, but still continues to smolder slowly, but so dimly that it

cannot be seen until the miner is close upon it, or perhaps in the act of catching hold, when the powder becomes ignited. We have known cases when the miner has lived to tell the tale that when in the act of taking the squib from the hole he has in doing so pressed the fire on the powder, causing the explosion of the shot. When these accidents occur they are generally attended with fatal results.

There is also another source of danger which is connected with the use of powder in general. This danger is to be apprehended in mines generating explosive gases. In the first place, if the naked light is used it is dangerous to apply the open light to the match in lighting it, as there is always great risk of igniting feeders or blowers which the bored hole has liberated. In such cases there is danger of the burning gas igniting the powder in the squib before the miner has time to retreat to a place of safety.

There is also danger of explosions should there be any standing gas (carbureted hydrogen); but if in our most fiery mines the use of powder or other explosives was prohibited, the consequence would be that some of the most valuable collieries would have to be abandoned, or the consumers of this fuel would have to pay such high prices that it would be only very few that would have the pleasure of using anthracite coal.

Powder, as a matter of course, is used in bituminous coal mines, but not nearly to so large an extent as in the anthracite mines, and then only under very stringent rules. It has been deemed necessary to have stringent laws passed in regard to the use of powder where it is only used in small quantities, we think it is much more important to have strict laws here where we use such large quantities. We are sorry to say that there is neither law nor discipline in the use of powder in the anthracite coal fields.

SETTLING.—The ground along F street, near Union, and on Union street, yesterday, was found to be settling. The water and gas pipes were broken for the distance of about 100 feet on F street, and large cracks in the ground were opened, into one of which an ice wagon sank to the hub. There seemed to be a side movement to the east as well as a gravitation of the earth in that section. The veranda in front of Mr. Kelley's house was drawn away from the upright pillars to a considerable extent, and portions of the bulkhead were thrown out of plumb. The gas company took the precaution to dig the earth from underneath their pipes, so that they would settle evenly and not break. The center of the street had settled about five inches at noon, and was still slowly receding last evening. Another crack was discovered on Taylor street, near the Episcopal church. Of course the only cause of this is the giving way of the earth where mining has been done underneath. It is the opinion, however, of those best posted in these matters that if the whole timbering was taken out of the big bonanza, too swelling of the vein would be so great as to shut up the entire space, so that no effect would be perceptible on the surface, or, at least, none appreciable except by the running of nicely adjusted machinery. The operations of yesterday were doubtless caused by workings nearer the surface. The excavations in the Consolidated Virginia under the place where the ground settled are at least 1,500 feet under ground.—*Virginia Enterprise*.

DESERT LAND INVESTIGATION.—A dispatch from Washington, dated Oct. 30th says: The Commissioner of the General Land Office, acting under direction of Secretary Schurz, to whom he referred the matter, will shortly issue additional instructions regarding the investigation of suspended desert land entries. These supplemental instructions will provide that the notice for taking testimony shall be served by mail upon the person in whose name the entry was made, if his residence is known, and by publication in a newspaper in the county embracing the tract, if his residence is not known. They also require inquiries to be made whether the applicant knew the character of the land before the entry was filed, and if so, for how long a period; whether he himself paid the first installment, or if it was advanced by any other person, by whom; and whether he has conveyed, assigned or mortgaged, or agreed to convey, consign or mortgage the land; and if so, upon what consideration. Local land officers are furthermore specially instructed to obtain testimony as to the character of the land from other persons than those applying to enter them.

IMMENSE PIPE LINE PUMP STATION.—A correspondent of the *Oil City Derrick* says the American Transfer Company are building two of the largest pump stations in the world. One of these is located at Carbon Center and the other at Freeport. The boilers, engines and pumps are enormously large and powerful, the latter being the largest ever manufactured, the cylinder having a diameter of 30 inches. In each station are three 60 horse-power boilers, with engines to correspond. Instead of iron smoke-stacks, such as are commonly used, brick chimneys 60 feet high will be built. The company expect to be ready to pump in about two weeks. In the line from Bullion to Oil City, and with but one station, they throw 3,300 barrels a day, and if pressed can throw 4,000 barrels. The Pittsburg line has a capacity of 6,000 barrels per day, and instead of having four stations, as was at first urged by the company, Mr. A. C. Beeson, the manager, said he could do it with one; and this he proposes to do with the splendid machinery above mentioned.

## MECHANICAL PROGRESS.

## The Field Still Open for Inventors.

Those who sometimes conclude that the rapid progress of inventions has brought to us the borders of the inventor's field, do not perceive the crowning needs of men which remain unprovided for. A writer in the *Polytechnic* hints at some of the directions which still lie open for inventor's triumphs as follows: Ramie and other fibers still defy the textile art. And the Indian Government has offered two prizes for the best machine for the preparation of the ramie fiber. The first prize is one of \$25,000, and the second of \$5,000. The gorgeous aniline dyes fade with a summer's sun. Household fires, once synonyms of health and cheerfulness, are now gloomy and noxious monuments of our heedlessness of things sanitary. The domestic conveniences that should minister to our comfort and well-being, poison us insidiously but surely. Our vaunted gas-lights blacken our paint and kill our window plants, while in the street, the pipes which lead the gas destroy our shade trees. Our sewers and our drains are confounded in name and use, and both of them are poisonous. Our chimneys breathe forth smoke which is unconsumed fuel, and hence wasteful. Our steam boilers, with partly consumed fuel supply our engines with wet steam, and the engines (whose cylinders have to be supplied with oil, through faulty design and workmanship) wastes part of the remainder. Our horses, shod with no regard for humanity or for tractive effect, draw wagons or cars which rattle our teeth out, on roads or rails which rattle the vehicles to pieces. The explosives which long ago were constrained to throw hurtful missiles for miles, have but in one instance—blasting—been employed in peaceful work; if we may except the gunpowder pile driver, the precursor of a long line of explosive motors yet to come. There is yet no machine which will satisfactorily and economically compete with nature in supplying a commodity now so great a necessity. The science of aeronautics to which the veteran Wise and others have devoted so much time and skill, and which they have demonstrated to be far within the bounds of safety—has not been developed from flotation to guidance—still less propulsion. A spark of fire has terrors greater than those of the avalanche or the glacier.

For these and hundreds of other evils, inventive genius must provide the remedy; and as new and artificial wants arise and develop into necessities, upon the inventor, ever in the vanguard, devolves the duty of exploring the land of the possible and providing for the legions of the actual.

**THE JEWELRY INDUSTRY OF THE UNITED STATES.**—We read in the report of judges of group XI., Centennial exhibition, that according to the data of 1871, the last year of the war tax, the jewelry manufacture at Newark, N. J., alone, upon which that tax was paid, amounted to eight millions of dollars, and in the city of New York, the same year, it was between six and seven millions. The number of working jewelers in the United States is estimated at 25,000 to 30,000. Of these Massachusetts has about 1,500; Rhode Island, chiefly in the city of Providence, 2,500; Newark, N. J., about 60 establishments, and nearly 2,500 workmen; and the city of New York about 6,000 workmen. In some of the jewelry manufacturing factories are employed, in ordinary times, from 300 to 400 men. There are also in the United States about 12,000 watch and jewelry stores of importance. Connected with these is always a force of watch repairers and working jewelers adequate to the business of each individual establishment.

**SQUARE SHOULDERS TO PIVOTS.**—A correspondent of the *Horological Journal*, having asked for the best method of making the beautiful square shoulders to pivots as seen in the best English watches, is told: "First, the pivot and shoulder must be turned square and cut smooth. In order to do this perhaps it is unnecessary to add that you must attend to all the minor details, such as good centers to your turns and on the pinion. A true ferrule, and a long stroke with your drill bow, and a good graver, are also necessary. Then take a pivot polisher carefully filed up (this polisher, as is well known, is made of flat steel with the edge beveled off the same as a pivot file), and with sharp red stuff work it on the pivot and shoulder, being careful to keep the polisher at right angles with the pinion, and occasionally allow the polisher to travel in the same direction as the drill bow. Finish off with fine red stuff."

**PROGRESS.**—Among the more noteworthy exports from the port of New York in the week ended October 9th, says the *American Manufacturer*, were \$6,750 worth of sword blades and \$100 worth of steel to Rotterdam, \$100 worth of cutlery to Havre, \$274 worth of Britannia ware and a \$1,900 carriage to London, two locomotives valued at \$20,600 and \$225 worth of pig iron to New Zealand, \$720 worth of pig iron to Mexico, and saws and muskets to British Anstralia.

**KEELEY.**—We now read in Eastern exchanges that the "Keeley motor" is pronounced an unmitigated humbug by those who have examined it.

## Burnished Gilding on Glass.

A foreign publication, *Design and Work*, gives the following practical instructions: In the first place it is necessary to make a size for fixing the gold leaf to the glass, which is made in the following manner: Obtain some best isinglass, and place as much in a teacup as will cover a shilling piece; then pour half a cupful of boiling water upon it; then add as much spirits of wine as water in the cup, strain the whole through a piece of fine cambric or a silk handkerchief; when cold it is ready for use. Whatever writing or ornament you require to put on the glass must be first drawn or set on paper the exact size of the glass. When you have made your design or letters on the paper (with a lead pencil) the size you require, prick the outlines through with a fine needle, placing the paper on a piece of smooth, soft wood, so that it does not blunt the point of the needle (and make the holes unnecessarily large). When this is done, clean your glass thoroughly; then place your design, reversed, to back of the side you mean gilding, fixing it with a little gum at each corner; then place your glass in a slanting position. Take a large size swan-quill pencil, and flow the size on where you require the writing or ornaments; then commence gilding, putting your gold out on a cushion, and cutting it the proper sizes, or of such sizes as you can easily take up with the tip. Let each joint overlap the other, gilding the whole space where the writing, etc., is to be, having the gold about one-fourth inch wider at top and bottom of the letters. When you have completed the gilding so far, the glass should be set upright to drain the surplus size off, and near a fire, or in a warm place, to dry. When dry, which you will ascertain by its assuming a burnished appearance, take a piece of cotton wool and rub it over very softly. By this means you will remove all the loose pieces of gold, and increase the burnish of the gold. If there are any faulty places in the gilding, flow a little size on the place, and put a piece of gold over it, rubbing the place so repaired gently with cotton wool, when dry. Then use a large flat camel-hair brush, and size the whole of the gold over lightly, so as not to disturb the gold. When this is dry, pour some hot water over the gilding, which enhances the brilliancy of the gold very considerably. When dry, which it will do in a very few minutes, size it over softly to prevent the paint from percolating the gold. Having completed your gilding, you take your design off the back of the glass (which enabled you to see how far to gild), and place it on the gilded side, reversed, taking care to fix it securely, so that it shall not move, while you pounce it over with a white pounce softly; then raise the paper off the glass carefully, so as not to brush the pounce marks away. You will then have the outlines of your design left on the gold. Take a sable writing pencil, and fill up the outlines with Brunswick black of as thick consistency as you can work it with the pencil; when this process is quite hard, take a wet sponge, and gently wash all surplus gold off clean. Then take a small straight-edge and a chisel, and cut the top and bottom of the letters, etc., quite straight and true. This process is called trimming, by which means you obtain a sharpness of outline that you could not obtain with the pencil, however expert you may be. You may then shade in what color you think proper, and paint whatever color background over all to suit your fancy.

**A ROCK BORING DEVICE.**—We read of a new device for rock boring, which consists of a cylinder and a piston rod with two pistons thereon. Steam, air, or other elastic fluid is introduced into the middle of the cylinder, and acting on one or other of the pistons closes the exhaust, and forces the steam or air from one piston to the other piston. This is effected by one or other of the pistons coming into contact with a slide valve, which, at the proper time closes the required port or ports, leaving other port or ports open. The drill being fixed or attached to one end of the piston rod is automatically fed into the rock at every blow of the piston by means of a small cylinder fixed to the side of the above named cylinder, and so arranged that steam or air will pass from the large or first named cylinder to the small cylinder, and act upon suitably arranged catches and wheels; or we may introduce the steam or air into the middle of the slide valve, and use the body or space between the two pistons for the purpose of exhaust.

**INCUSTED BRONZE.**—Incrusted brouze, says the *Jeweler*, is the name of a Parisian novelty in bronze or copper ware, with gold and silver ornamentation. To fix the gold or silver ornamentation on articles of bronze or copper, they are first painted in water colors, the principal ingredient of which is white lead. When several articles are to receive the same drawing, it may be printed in the same manner as in porcelain painting. The places which remain unpainted are varnished. The article is then laid in dilute nitric acid, which dissolves the color and bites the metal on the painted places to the required depth. After washing the article it is placed in a silver or gold bath, where the free surfaces are electrolytically silvered or gilded. The varnish is then removed, and the whole surface is polished so that the gilded and silvered parts are not unduly prominent. The article can then be bronzed. A fine effect is produced with black bronze by sulphuret of copper in the spaces between the gold and silver.

## SCIENTIFIC PROGRESS.

## Catastrophism.

According to a review by Prof. R. W. Raymond of a late address by Prof. O. C. Marsh, on "The Introduction and Succession of Vertebrate Life in America," Prof. Marsh's summary of the work thus far accomplished in American paleontology forms, incidentally, an interesting companion-piece to the recent address of Clarence King, whose conclusions were drawn chiefly from stratigraphic and dynamic geology. Mr. King's biological theory is, however, relegated to its proper subordinate place as a part of the Darwinian evolution. Says Prof. Marsh: "As a cause for many changes of structure in mammals during the Tertiary and Post-Tertiary, I regard, as the most potent, *Natural Selection*, in the broad sense in which that term is now used by American evolutionists. Under this head, I include not merely a Malthusian struggle for life among the animals themselves, but the equally important contest with the elements and all surrounding nature. By changes in the environment, migrations are enforced, slowly in some cases, rapidly in others; and with change of locality must come adaptation to new conditions or extinctions. The life-history of Tertiary mammals illustrates this principle at every stage, and no other explanation meets the facts."

Prof. Marsh, like Mr. King, explains the "almost total absence" of the remains of fishes from the Miocene lake-basins of the West, by the theory (which he says is, "perhaps the best") that "these inland waters, like many of the smaller lakes in the same region to-day, were so impregnated with mineral matters as to render the existence of vertebrate life in them impossible." This theory, argues Prof. Raymond, seems to involve the conclusion that the Miocene lakes had no outlets. There are lakes, large or small, with which we are acquainted in the West, which, having outlets, are thus impregnated with mineral matter. Utah lake, deriving its water from the same country which furnishes the supply to the Great Salt lake, is fresh, and swarms with trout. Even the Sink of the Humboldt, which has no outlet except the seepage of its waters under the surface for some distance further down the valley, is but slightly brackish. But if the Miocene lakes were entirely without drainage, and therefore saline, why is the absence of the remains of fishes not total, but only "almost total?" One fossil fish, we should think, would be a troublesome fact for this theory, unless, indeed, it be assumed that the individual lived in a river by choice, and found his way unwillingly to a lacustrine sepulcher. A paucity of fishes might, perhaps, be accounted for by the otherwise probable supposition that the Miocene lake outlets found their way over precipitous cataraacts to the sea. The Columbia and Colorado river systems show the remains of such escarpments plainly enough.

**CLIMATIC CHANGES IN EUROPE.**—A Swedish paper just received, says *Nature*, publishes an interesting article under the heading: "Why is the Climate of Europe growing Colder?" The article states that in the Bay of Komenok, near Koma, in Greenland, fossil and very characteristic remains of palm and other trees have been discovered lately, which tend to show that in these parts formerly a rich vegetation must have existed. But the ice period of geologists arrived, and as a consequence of the decreasing temperature, this fine vegetation was covered with ice and snow. This sinking in the temperature, which moved in a southerly direction, as can be proved by geological data, i. e., the discovery of fossil plants of certain species, seem to be going on in our days also. During the last few years ice has increased far towards the south; thus between Greenland and the Arctic sea colossal masses of ice have accumulated. On European coasts navigators now frequently find ice in latitudes where it never existed before during the summer months, and the cold reigning upon the Scandinavian peninsula this summer results from the masses of ice which are floating in the region where the Gulf Stream bends towards our coasts. This is a repetition of the observations made in the cold summer of 1865. The unaccustomed vicinity of these masses of ice has rendered the climate of Iceland so cold that corn no longer ripens there, and the Icelanders, in fear of a coming famine and icy climate, begin to found a new home in North America.

**A RIVER OF INK.**—The Cumberland *Alleghanian* states that the water from the mines above Cumberland is impregnated with sulphate of iron, the result of the oxidation of sulphuret of iron in the coal, and flows into Will's creek. The report goes on to say: "The creek is now very low and but a very small body of water flows down its bed. At the head of the city are two extensive tanneries, and in the tanning of hides large quantities of tannic and gallic acids are poured into the stream. As soon as these acids come in contact with the sulphate of iron the water becomes black, as is now the case in front of our city. There are millions of gallons of ink now lying in the bed of the creek, which needs but bottling and packing to make a salable article for exportation."

**WHAT HOOKER AND GRAY WILL DO?**—As these distinguished investigators have lately explored our coast and the great central region, it will be of interest to know what they propose to do with the data gained. A letter written to Dr. Hayden by Sir Joseph Hooker, a day or two before his departure for England, outlines some important botanical work projected by himself and Dr. Gray, of Harvard. The following is an extract of the letter: "We shall hope to take Colorado as a central point for opening out the main features of the flora of North America, and discuss them in relation to it and to one another in a rather detailed manner. We hope to bring out clearly the contrasts between the Rocky mountain flora and that of the forest regions of the East and West, including in the botanically defined Rocky mountain region the whole of central unforested North America from the west of the Mississippi to the base of the Sierra Nevada. The region thus defined will be divided into, first, an eastern plain; second, a central Rocky mountain district proper, extending from Pike's peak to the Wasatch range; third, a western district, that will include the desert country. The Rocky mountain proper district again will be divided, vertically, into an Alpine, and, perhaps, a sub-Alpine and lowland flora. The comparison of the flora with that of the mountain ranges of Asia and Europe will follow; and then we must see what we can do in the way of correlating any of the features with the glacial epoch and Lesqueriaux's vegetable fossils." Sir Joseph Hooker expects to return to the United States in a few years, for the purpose of making the flora of the Atlantic coast an object of special scientific research.

**COMBUSTION OF PETROLEUM.**—It appears from the reports of the workmen in the various petroleum refineries that fires often break out in them in spite of all precautions, and without any visible cause. The *American Review* is authority for the statement that persons familiar with the refining of petroleum also say that, if cold water is poured on warm oil for the purpose of cooling it, the oil will sometimes suddenly ignite. It is unfortunate that, in this case, it is not certain whether it was water or steam which was applied, but if the fire arose from chemical action, the composition of the two substances was the same, only the high temperature and vastly extended condition of the oxygen in the steam might have caused it to unite rapidly with the carbon of any of the more volatile portions of the partially refined oil, which might, by imperfect process, have been allowed to enter the agitator. Petroleum is not spontaneously ignitable in air under ordinary atmospheric conditions, but it is well known that spontaneous combustion, though generally slow in inception, often occurs rapidly from the quick absorption of oxygen from water or damp air by highly carbonized substances, of which special instances may be mentioned in lamp-black works, and places where charcoal finely pulverized is used.

**ARCTIC COAL.**—English reports state that coal has been found in latitude 81° 44' north and 65° 3' west, now known as the Discovery bay. It was found in the side of a narrow mountain gorge. The prevailing rock of the surrounding district was a shining claystone of an irregular arrangement, but mainly dipping to the westward, and so far as could be ascertained, devoid of fossils. Vegetation included no less than 60 species of plants. Coal had been brought home on previous expeditions from high latitudes but not so far north. The coal (specimens of which were exhibited) has a bright, shiny appearance, is somewhat of a pitchy character, and very brittle. On analysis it could not be distinguished from a bituminous coal of exceedingly good quality, and belongs to the true carboniferous period. It is very similar to coal found in some English coal fields, and particularly in Chesterfield. It contains 65% of coke.

**NEW SPECIFIC GRAVITY MACHINE.**—A new densimeter submitted to the Academy of Sciences, Paris, by M. Gosselin, is very simple in construction and operation. A wooden rule is suspended by a wire attached to some convenient point other than the central point. To the long arm a weight is attached sufficient to balance the body to be examined hung at the end of the other. The latter is immersed in water, and the weight on the longer arm is moved until the rule is again horizontal. A scale on this arm shows at once the density of the body at the point occupied by the weight.

**COMPRESSIBILITY OF LIQUIDS.**—E. A. Amagat has conducted a series of investigations on the compressibility of volatile liquids, when the liquid state was maintained by pressure at a temperature higher than their boiling point. The experiments were carried to a pressure as great as 39 atmospheres, the results being in the most satisfactory accordance with deductions from the mechanical theory of heat.—*Comptes Rendus*.

**SEEDS IN SEA WATER.**—*Guilandina Bonduc* is a West India tree of the Leguminosae family, with a seed as large as that of our Kentucky coffee. Some seed carried by ocean currents to the shores of Cornwall, in England, germinated, on being sown by their finder. They must have been at least three months on their journey, all the time soaked in sea water; and their germination under these conditions show how plants may have migrated from place to place even by the intervention of the sea.

## THE ENGINEER.

### Sounding for the Channel Tunnel.

In the latest reports of M. M. Polier and Lapparent upon the soundings for the channel tunnel in which they give the result of the numerous soundings which they have taken during the last 18 months for the purpose of ascertaining the thickness and impermeability of the different strata in the channel, they state that "observation shows that the soil under the sea preserves the same characteristic as upon the French mainland—that is to say, a line traced upon the surface of one of the beds of chalk consists of long straight lines connected with one another with very pronounced sinuosities. Observation has also shown—and this is a capital point with regard to the making of the tunnel—that in these sinuosities, of which there are two in the channel, the strata are evidently continuous, and that the distance between the two successive lines is filled up, not by a fissure, but simply by a curve. There is, therefore, no reason for anticipating that the work will encounter any geological difficulties, properly so called, if we bear in mind the information furnished by a study of the sea's bed and by the work done in the mines which run down into the chalk. The boring at Sangatte has not been carried far enough to admit of any definite opinion being given as to the jurassic development of the soil in that region, but it has confirmed the deductions drawn as to the progressive diminution in thickness of strata below the chalk which runs from Boulogne toward Calais. These strata are formed of sand and clay, with an admixture of paleozoic pebbles, red calcareous and carboniferous marl, but without any rock of the coal order.

**THE HUDSON RIVER TUNNEL.**—The work upon the tunnel under the Hudson river, between Jersey City and New York, which has been delayed for some time by litigation, it is now stated, will be resumed early this fall. *Engineering News* says: A shaft 28 feet deep has been dug at the foot of Fifteenth street, Jersey City, and this depth will be increased 20 feet. From this as a starting point, the tunnel will proceed in a northeasterly direction under the Hudson river and the Christopher street ferry slip. The entrance on the New York side will be in the neighborhood of Washington square. From Jersey City the grade will descend two feet in every 100 feet, until a point 2,700 feet from the New York side is reached, when it will begin to ascend at the rate of one foot in every 100 feet. The tunnel will be two miles in length, with a road-bed 23 feet wide and two separate tracks. Through its entire length it will be lighted by gas. The wall will be constructed of brick, with a thickness of four feet. At no point will the top of the tunnel be less than 35 feet below the surface of the water, and in many places it will be 70 feet below. One hundred and twenty laborers will be engaged in the construction of the tunnel. The work will go on during the whole of the 24 hours, the force working in three relays, of eight hours each. Although the tunnel will be used for the conveyance of passengers, its main object will be the transportation of freight to and from the great railroad lines which terminate in Jersey City. The capital of the company is \$2,000,000.

**NEW DOCKS ON THE CLYDE.**—A few weeks ago extensive new docks were opened at Stobcross, on the Clyde. The depth of water in the dock is 20 feet, and the entire cost will be about £1,600,000. When the dock is entirely finished the water-surface will extend to 34 acres, the length being 3,000 feet, and the breadth 700 feet. Access to the basin, which is a tidal one, is obtained at the south-west extremity, the passage being 180 feet in width. On the north side the wall of the quay is founded to the depth of 41 feet below the level of the quays. A central quay passes from the eastern end parallel with the north and south side walls, separated from them by water-ways for distance of 270 feet, with a uniform breadth of 195 feet. The water-space between the western end of this quay and the west wall of the dock forms a canting ground, and is of such dimensions as will permit of the largest vessels being moved and turned about with every freedom. A strong iron bridge on the swing principal has been placed at the entrance to the dock, and although it weighs 800 tons, is 181 feet long, and 40 feet broad, can be moved from one side to the other in a minute and a half. The bridge is worked by hydraulic power supplied from an engine-house placed in the vicinity, and which, by means of pipes, can be connected with cranes and similar machinery at any portion of the dock. The engine-house is a handsome building, and is surmounted by a tower in which a clock and a chime of bells have been placed.

**CURIOUS TRACKLAYING.**—The *Railway World* says that an interesting experiment was carried out last month by a detachment of the German "railway regiment" in order to determine the rapidity with which a line of rails could be laid down over ground presenting considerable difficulties, and also to ascertain the rate at which work could be continued during the night by the aid of electric and other artificial lights. The portion of railway constructed, led from the station of Klausdorf to

the summit of some adjacent heights, rising 50 or 60 feet above the starting point. Its length was about 1,000 paces, and the gradients were, therefore, necessarily steep, in some places being as high as one in 20. The work was begun at 7 o'clock in the morning, and by midday the rail were laid on the lower and more level half of the road. In the evening the workmen were relieved by other companies of the regiment arriving from Berlin, and, although there was no moon, the work was steadily continued. Torches were employed where excavations or embankments had to be made; but where more accurate work had to be executed or more difficult operations had to be performed—as, for instance, where rails had to be laid and adjusted—the scene was illuminated by electric lights arranged upon an elevated platform. Shortly after midnight all the heavy work was finished. In two or three hours more the rails were finally adjusted; and in the morning the regiment returned to Berlin.

**A GREAT WORK IN HOLLAND.**—The latest and in some respects the most important of the many remarkable engineering works of Holland, says the *Railway World*, is the new railway bridge over the Maas at Rotterdam. This work, after an expenditure of nearly 2,000,000 florins, of which rather more than half has been expended on the superstructure, and less than half for the substructure, has been completed within eight years, about the same time required for the construction of a similar bridge at Hamburg, and that between Venice and the continent. Five gigantic wrought iron arched girders, resting on immense piers, and of spans, ranging from 216 feet 6 inches to 295 feet 4 inches, and a height of nearly 20 feet above ordinary high water level, connect the city with an island in the middle of the stream, two other arches uniting this island with the opposite shore. Another great work at Rotterdam is now in course of completion, which has attracted general attention on the continent. A few paces below the railway bridge, another bridge, the so-called "Willembrug," to serve for the ordinary carriage traffic of the city and foot passengers, is in course of construction. The foundation stone of this bridge was laid three years ago by the King of Holland in person. This, like the railway bridge, is provided with two pivot arrangements, of which one is within the city, the other in the canal called the King's Harbor (Koning's Haven), 656 feet wide, between the opposite shore and the island above mentioned, to permit the passage of the largest ships.

**RECLAIMING THE EVERGLADES.**—The engineer now attempts the turning of the historic everglades of Florida, into fruitful fields. A writer in the *Engineering News*, says that it has been for some time known that the surface of the everglades is elevated between four and five feet above the waters of the ocean, and the scheme of draining this immense territory has been advanced. There is now some prospect of the realization of the project, as parties in New York, representing abundant capital, have taken hold of the matter, and an engineer has been employed for some time making investigations. This is a subject that will well repay examination, for here are 5,280 square miles of the richest land in the world, capable of raising \$600 worth of sugar per acre, without any fertilizers. This land, once drained, would far exceed in value the *polders* of Holland, owing to its semi-tropical position and its adaptability for the raising of bananas, sweet potatoes and all tropical fruits. The report of the engineer making the preliminary survey is looked forward to with lively interest by all Floridians and others who are aware of the capabilities of this region.

**MR. EADS' PAY FOR THE JETTIES.**—Inasmuch as the engineering works in the mouth of the Mississippi are showing practical success, it is interesting to recall the terms of the contract. The *American Manufacturer* says: The terms of the bill provided for a payment in all of \$5,250,000, this amount to be paid in installments, subject to certain conditions. The first payment was made in February last for a channel 20 feet in depth, by 200 feet in width of that depth, and consisted of \$500,000. For every additional two feet in the depth of the channel, each depth of specified width, he is to receive \$500,000, while after a channel 24 feet in depth has been obtained he is to receive \$250,000 for maintaining it, with a like amount for preserving each additional depth of two feet. When a channel 30 feet in depth by 350 in width, which is the desired channel, is obtained, \$4,250,000 will have been paid, the remaining \$1,000,000 to be held as security by the Government, \$500,000 of which is to be held for ten years. He is also to receive \$100,000 per annum for maintaining this channel 20 years.

**COUPLED-LEVELING INSTRUMENT.**—Engineer Aita, being charged with the survey of Padua for drainage and water-service, devised a coupled level which remedies many of the surveying difficulties of tortuous and narrow streets. It consists of two glass tubes, doubly clamped to graduated staffs, and connected by a caoutchouc tube of any desired length. The two clamps are movable, the glass tubes being partly, and the connecting tube wholly filled with water. The observer at each end brings one of the clamps to the water level, and enters the scale-reading in his note book. When the books are compared, the difference of readings give the difference of altitudes.

**RESISTANCE OF RAILWAY CURVES.**—A writer in the *Railway Age* says: Much has been said and written about railway curves, and most engineers differ in regard to them. My practice in the location of roads is somewhat different from the usual formula, by which curves are "flattened" upon grades. The speed of trains I consider an important element in comparisons, and it is fixed upon my roads from eight to ten miles per hour, and up to 12. An ordinary equation of curvature to grade is a radius of 400 feet to a grade of 26 feet per mile. I found that a curve of such radius is only equivalent in the practical working of my road to about 21 feet per mile. I give the result of my experience as a useful physical fact, inasmuch as ordinarily there is little knowledge of the resistance of curves. It must not, however, be overlooked that in this case the speed is that of slow burden trains.

**A STONE BRIDGE.**—One of the most notable examples of bridge-building enterprise in the world is that just completed by the North British Railway Company across the estuary of the river Tay. The structure is nearly two miles long, consisting of 85 spans, varying in length from 67 to 245 feet. In the central part the bridge has a clear height of 88 feet above high water. The 13 largest spans, forming about a third of the structure, are placed over the navigable part of the river. They rest on 14 great piers, the foundations of which are immense caissons. From the top of the highest girder to foundation, the structure of stone, concrete and iron is not less than 150 feet high. The work on this great structure was commenced in 1871, over six years ago. It is built for all time.

### Lucky Strike.

The attention of the mining public, says the *Boulder County News*, of Oct. 26th, has been turned this week towards Sunshine gulch, where one of the most promising strikes of the season has recently been made. The Warsaw tunnel is owned by C. W. Smith, Superintendent of the Grand View mine, at Sunshine, Geo. W. Walton and E. White. It is located on what is known as Warsaw hill, on Sunshine gulch, about a mile from the camp. There are two tunnels opened on the vein, the lower one having been run a distance of 220 feet into the hill, and the upper one, the mouth of which is about 200 feet up the hill, is now in 100 feet. The upper tunnel has been producing some pay ore for the last 30 feet, but until within a week has not promised any more than ordinary returns. About a week ago, however, they came upon a widening of the vein, which, as they went in, has developed itself into a chimney of rich ore that promises to make them a great deal of money in a short time. Up to this writing they have taken out about 100 pounds of ore of almost unequal richness. Forty pounds of it, that has been milled, returns them \$7 per pound, and they estimate the value of the balance at from \$7 to \$10 per pound. The richest of the ore appears in half-inch streaks, a number of which run through the pay streak proper, which is at present 20 inches in width. The ore in the small streaks appears to be almost pure tellurium, some sylvanite being noticeable. The work of stopping was commenced immediately upon the chimney being struck, and two men can take out about 12 pounds of the richest ore in a day, besides a good deal of second-class that will run in the neighborhood of \$500 per ton, and a third-class that assays from \$40 to \$100 per ton. Of the second-class they have about half a ton on hand and expect to make it a ton so as to ship it before the week is out.

The lower tunnel is estimated to be within 20 to 30 feet of the same chimney, and the probability that it is near at hand is strengthened by the widening of the vein that has been noticeable for the last 10 feet, and should it prove as anticipated there will be 140 feet of stopping in the perpendicular before the upper tunnel is reached. In addition to the openings mentioned, a 75-foot shaft has been sunk on a parallel vein that is about 12 feet distant. The investment has been upwards of \$3,500, the whole of which is likely to come back to the owners in a short time. The walls of the upper tunnel are five feet apart all the way in, and the lowest tunnel averages three feet. The walls are slick and clean and the vein is a true fissure. Messrs Walton and White are working the vein alone and will continue to do so until it is sufficiently opened up to work a larger force to good advantage. They know they have got a good thing and having worked long and well propose to reap the benefits of it.

**THE NORTH CALHOUN MINE.**—This mine, formerly the Woodchopper, says the *Carson Tribune*, is situated on the east side of the Carson river, and about one mile from the Mexican dam. It is now under the control of Senator Schultz, W. Krauss, Thomas Gallagher and F. Price, all of Storey county. The ore is termed base metal, and contains, beside galena a large amount of silver. The company have erected a battery which will be in operation in a few days. After crushing the ore they will concentrate the metal and send it to California for final reduction. There are 200 tons of ore ready for working, and from present appearances it seems inexhaustible. The ledge at the bottom of the incline is 12 feet wide. Our readers will recognize the fact that the mine in question is only four miles from Carson City, and therefore in the Eagle Valley mining district.

### A Complete Mill.

The Walker Brothers' mill was finished and steam was turned on the early part of last week to test the machinery and running gear. Everything was found to work to a charm, but owing to the want of battery screens, the work of crushing did not commence until last Saturday, when the bills echoed for the first time to the thunder of these stamps, and all the patriotic bunting of the village was spread to the breeze in honor of the starting of the first mill in Walker-ville.

Ground was broken for the foundation of this mill on the 17th of last July, so it was just three months and two days from the turning of the first sod until the whistle summoned all hands to duty, and 15 more stamps were set to work to test and develop the mineral resources of Butte.

The mill consists of three compartments: First, the ore room, into which the ore is delivered from the mine; next the main or battery building, comprising the drying kiln and battery room; and finally, the pan and settler compartment. In addition to these, there is a boiler and engine room 28x28 feet, and also a retort room 24x28 feet.

The power for working the battery, pans and settlers is furnished by a smoothly running engine of 75-horse power. The main driving shaft, running under the pan room, is 38 feet in length, and upon it there are 11 belt wheels. The capacity of the mill upon the ore at present being worked is 20 tons per 24 hours. The above is a brief description of what an experienced mill man pronounces "the most complete and best constructed mill in the entire West." It was built under the immediate supervision of Lathrop Dunn, the present Superintendent, assisted by Edward Reimal, formerly partner of Daniel Bell, the famous mill builder of Utah, and by Julian Smith.—*Butte Miner*.

**JAPANESE MIRRORS.**—Repairing of mirrors is a process to which the art of Europeans and Americans has not yet arrived. As they make mirrors in Japan, however, the process of repairing is no more difficult than that of mending a stove. The Japanese mirror would seem to be only an improvement on that used by Helen of Troy—a metallic affair burnished and polished. It is a bronze disk, composed of 80 parts copper, 15 of tin and five of lead. It is cast in a mold composed of powdered stone and pulverized crucibles. The casting is polished by hand as the Japanese alone can polish; and the last process is to rub the surface of the mirror with an amalgam composed of quicksilver, tin and lead. And this is done by hand and with a piece of wash leather, till the mirror has a bright, reflecting surface. This surface solves the problem of repairing some mirrors, since it can at any time be repolished. At every stage of the work the choicest materials are employed. The cheaper mirrors have sulphide of lead and antimony instead of tin, in their composition. A curious optical effect can be produced by some of these mirrors—probably the best finished. On the reverse, which is also polished, are words and figures in relief. By throwing in a bright light the reflection of the mirror on a screen, these figures are seen to shine through the reflected surface of the mirror. The fact is noted by an English professor in the University of Tokio, R. W. Atkinson. He has been able to discover no satisfactory solution of the phenomenon, but it is certainly worth investigation. The body of the mirror is absolutely opaque, and there must be some law of refraction not yet fully discovered to account for an appearance so singular.

**THE ABUSE OF SAWS.**—The *Northwestern Lumberman*, in an article on the abuse of saws, says: Makers are annoyed by having saws returned for repair in such a condition that it is impossible they should go through the wood, from the miserable way in which they have been filed and set—some jammed all to pieces, some not half filed, some not filed true on the face or back while others are all shapes but the right one in the throat, leaving no chamber room for dust and chips. Some saws have a bad pitch, some no pitch at all; some out of round; some with irregular or long and short teeth, one up and one down. In many cases they are returned broken. Why? Each tooth of a 24-inch circular saw goes through the wood 2,000 times per minute, 120,000 per hour, 1,200,000 times per day, and if not sharp, the saw is strained at the root of the tooth thus often, which frequently not only closes the set, but must eventually break the saw, for although steel is strong, continual straining will make it tender, and it must break. The tooth becomes dull on the side or under the point in proportion to the amount of feed; thus, if the tooth takes one-eighth inch bold at each revolution, it will become dull for one-eighth inch below the point, or more if the feed be greater. A diamond will not cut if dull; why should a saw? A few minutes' filing two or three times a day would save tenfold the amount of time and labor expended in running an imperfect, dull saw, also making a saving in the amount of power consumed; and a heavy percentage in the amount and quality of lumber cut. It is a mistaken idea that there is a saving by not taking time to sharpen a saw.

A DISPATCH from London, October 29th says, that on Saturday there arrived from Australia, India and China £531,000 of gold; most of which it is expected will go into the Bank of England.

**Heroines of the Hour.**

Noyon's heroine is a servant girl. A common sewer of great depth, says the New York *Tribune*, had been opened for repairs, and four men, passing that way in the dark, fell in. It was not until midnight that their perilous situation became known. The poor wretches were already suffocated from poisonous vapor; their moanings were heard, and their wives and children, frantic with grief, besought the bystanders for aid; but among all the stalwart men who gathered around the hole there was not one brave enough to go down and rescue his fellow-creatures. Then it was that Catherine Vasseur, a lass of 17, volunteered to descend into the pit, where she fastened a rope around two of the men, and, assisted by those above, she had the happiness of restoring them to their wives and children. Again she descended, and fastened a rope around the body of a third man, but her breath began to fail her. Fainting from foul air and exhaustion, she had sufficient presence of mind to knot the end with her own luxuriant tresses, so that when the dastardly fellows above drew the man to the surface they found the all but inanimate body of the young girl swinging by her hair to the end of the rope. Fresh air and stimulants restored her to consciousness, but not in time to save the fourth man, who perished in the pit.

A correspondent writing from Kuruh Dara, Turkish Armenia, in describing the battle at Kizil Tepe, says: It is currently reported to-day about the camp that one of the attacking columns of cavalry was under the command of a woman named Fatma, a daughter of an Arab sheik. A woman on horseback was seen at the front of the Circassian cavalry line when the first dash was made, after the pickets had been passed by means of the watchword, given in perfect Russian. It is stated by one of the few survivors whom I conversed with that this woman appeared utterly fearless of death, and that she rode across the line of her own troops when they were firing, in utter disregard of the usages of warfare and in evident ignorance of the absurdity of her conduct. She may have seen a picture representing Joan of Arc leading her troops. The poor, brave girl was killed before her men reached the Russian camp, indeed before the retreat became precipitous. She was seen to fall from her horse, and her whole troop of cavalymen, doubtless unable to restrain their steeds, passed over her quivering body. May she go straight to the harem of Mohammed in paradise.

**REALITIES.**—There is life and death going on in everything; truth and lies are always at battle. Pleasure is always warring against self-restraint. Doubt is always crying pshaw! and sneering. A man in life, a humorist in writing about life, sways over to one principle or the other, and laughs with reverence for right and the love of truth in his heart, or laughs at these from the other side. Didn't I tell you that dancing was a serious business to a harlequin? I have read two or three of Congreve's plays over before speaking of him; and my feelings were rather like those, which I dare say most of us have had, at Pompeii, looking at Sallust's bouse and the relics of an orgy—a dried wine-jar or two, a charred supper table, the breast of a dancing-girl pressed against the ashes, the laughing skull of a jester, a perfect stillness round about, as the Cicero twangs his moral, and the blue sky shines calmly over the ruin. The Congreve muse is dead, and her song choked in time's ashes. We gaze at the skeleton, and wonder at the life which once revelled in its mad veins. We take the skull up, and muse over the frolic and darings, the wit, scorn, passion, hope, desire, with which that empty bowl once fermented. We think of the glances that allured, the tears that melted, of the bright eyes that shone in those vacant sockets; and of lips whispering love, and cheeks dimpling with smiles, that once covered up ghastly yellow frame-work. They used to call those teeth pearls once. See! there's the cap she drank from, the gold chain she wore on her neck, the vase which held the *rouge* for her cheeks, her looking-glass, and the harp she used to dance to. Instead of a feast, we find a gravestone; and in place of a mistress, a few bones!—*Thackeray*.

**RUSSIAN SOLDIERS AND THE BIBLE.**—Among the strange incidents of the war in the East is the eagerness the Russian soldiers show for the purchase of Bibles sent for their use by the British and Foreign Bible Society. Over 60,000 Bibles have been bought by them since the Russian armies crossed the Pruth. An agent says that the readiness of the soldiers to buy is unparalleled in the experience of the society's continental work. It is a strange thing, he says, when fierce-looking Cossacks, armed to the teeth, thank you ten times over for having brought them the New Testament, and when they can scarce be restrained, in the gladness of their hearts, from taking you up in their bony arms to give you a well-meant hug of gratitude. And not only do the men buy, but they also read. The Russian soldier, he says, has yet to be discovered who would speak an irreverent word of the Holy Gospel. The commanding officer has frequently been the first to buy a number of copies, which he himself would distribute at once as a gift to the common soldiers around him.

**USEFUL INFORMATION.**

**Guarding the Snow Sheds.**

Now that winter is approaching, and the Sierras will soon don their caps of snow it is interesting to read of the renewed precautions which the Central Pacific Company have adopted to protect the snow sheds and those who pass through them. Lyman Bridges, a well known engineer, writes to the *Railway Age* as follows:

More than 40 miles of the road in the mountains is covered by snow sheds, and their liability to destruction by fire and snow slides renders special care necessary on that part of the line. Watchmen are required to go over the line in advance of all passenger trains. District electric signals are set up at regular intervals and used by these watchmen and all other guards to report their whereabouts, and any accident that may occur to the road-bed, tracks, sheds or trains. The method of working these signals is so simple that any intelligent laborer can use them, and yet they make known just the kind of accident that has occurred with unfailing accuracy. The watchmen have stated times to report and if a report is not sent in at the time appointed a guard is sent from the nearest station with all possible dispatch to learn why the signal was not given. If the watchman is found neglecting his duty he is either punished by suspension or is discharged, and debarred from being again employed by the company in any department. The time the watchmen are on duty is so short, and their districts are so small, as to guarantee that the men will be fresh for their work at all times. The watchmen are never required to be on duty longer than 12 hours. The district signals are also used as fire signals, and telegraph that a train is off the track, or a land or snow slide has occurred; that wrecking cars and crews are needed, or that trackmen are wanted; in fact, they can send messages covering all emergencies. Detonating signals are frequently used as danger signals, besides the ordinary red flags; in places very obscure additional watchmen are placed. At all bridges crossing running streams watchmen are placed, day and night; and electric signals are being prepared so that these men can call to their aid fire trains or wrecking cars with powerful blocks and tackle, boat hooks and any needed mechanical contrivance for protection from fire or freshet. From a high peak—Read mountain—north of the railroad, in the Sierras, a view of the snow sheds can be had along 18 miles of road. On this peak a lookout station is located during the summer, which is connected by a telegraph line with the road. The operators are furnished with powerful telescopes, and it is their duty to report any signs of fire in the sheds or in their vicinity.

Fire trains are kept at Truckee, Summit, Blue Canyon and Rocklin. The switch engines have fire pumps attached, and there are always 20 tons of water on cars, ready for them to attach to and start on their way to a fire at a moment's notice.

**CURIOUS MARKS OF ADMIXTURE IN WOOLS.**—In a letter addressed to the editor of the *Journal de l'Agriculture*, M. Viret calls attention to an apparently simple method of detecting the admixture of inferior wools with fleeces purporting to be of superior quality. It appears to be a common practice among a certain class of dealers to mix German wools with Australian goods of only half the value, and Spanish fleeces are similarly deteriorated by the addition of inferior Morocco wool. These are the most prevalent "tricks of the trade," but there are others in abundance. In certain cases the identification of a wool is easy, Russian and Buenos Ayres goods, for example, being readily distinguished from all others by the presence in the fleece of wild oats, in the one instance, and of a peculiar variety of small thistle in the other. But in German, Spanish, Australian and Morocco wools no such test is applicable. To distinguish between these M. Viret recommends us to have recourse to entomology. The fleeces from each of these countries will be found to contain coleopterous insects peculiar to it, and by an examination of these the real source of a wool in fleece may be indisputably determined, by whatever name a dishonest stapler may have placed it on the market. M. Viret adds that the credit for this suggestion is due to M. A. Levotviriou, of Elbert, who introduced it to the notice of the Entomological Society of France several years ago.

**WAXED PAPER.**—Waxed paper says the *Druggist Advertiser*, is made by saturating a well-made paper with beeswax. This may be done by the aid of a heated iron as in spreading plasters, or a solution of the wax in temperature may be spread on the paper with a brush. On the small scale, a piece of the paper to be waxed should be spread over a heated flat iron, and by passing a piece of a beeswax rapidly over the surface of it, sufficient wax will be absorbed by the paper. If properly prepared this paper will answer all the purposes for which tinfoil is generally used.

**Post Office Dangers.**

In postal matters some common expedients supposed to secure safety have the opposite effect. Speaking of the new envelopes made of paper and linen, Mr. Jeffery, of the London post office, who gives his opinion with all the weight of the manager of the department of lost letters, says: "Their very strength is their weakness, because if you put a paper knife in the folds of an envelope, it will lift it up without tearing, and may be closed again without any traces of the violation. This can be done wherever linen comes to linen, or where linen comes to paper. But where paper comes to paper, you cannot separate the parts without tearing and leaving the marks behind. It must be remembered, too, that the post office servants acquire marvelous expertness in determining by touch whether a letter contains bank notes or stamps; if they cannot get the knowledge by their fingers, felonious postmen can smell the stamps." A striking experiment on this subject was made by Mr. Jeffery. He made up 20 letters, only five of which contained stamps, and all of which were alike on the outside. An experienced post office servant was able to pick out, by the sense of smell, those with the stamps. The only device which baffled him was to scent the letters with *eau de cologne*. Of course mothers will continue to send currency to their boys at school by post, and the mass of mankind will insist upon remitting small sums in the form of stamps in spite of remonstrances and warnings. But it is right that they should know, from the testimony of experienced officials, that the employees of the post office become expert in the feeling of letters; that they can tell very correctly whether letters contain bank notes, coin or stamps; that they have, in fact, as keen a perception of valuable letters as an American post office clerk has of interesting English illustrated periodicals; and that, if stamp remittances are not frequently stolen, it is because they rarely are worth stealing.

**THE FRENCH BEET SUGAR INDUSTRY.**—The *Journal Officiel* of September 12th publishes a statement of the production and movement of home grown sugars from the commencement of the season up to the end of August. This document still further endorses the adverse reports which have appeared from time to time. The quantity of juice treated within the period named was 46,788,000 hectoliters, and the total production of sugar amounted to 280,307,544 kilogrammes, or 214,296,000 kilogrammes less than in the previous season. On August 31st the stock on hand in all the factories combined was only 6,388,693 kilogrammes of finished sugar, and 5,914,095 kilogrammes in course of manufacture. It is added that, besides the general reduction of production, the depreciation of the beet in saccharine value is this year particularly marked. In some districts the harvesting of this year's roots has commenced, and, so far as can be at present judged, the results are but indifferently good.

**GOOD HEALTH.**

**Economy in Foods.**

In times when the most rigid economy is often necessary to sustain life and provide comforts, it is essential to know how the questions of price and real nutriment in different foods compare. Our readers are often assured that the highest priced meats and vegetables are not the most nutritious, and it is time that all false notions about obtaining nothing but "first cuts" at the butcher's were done away with. We obtain through the London *Farmer* an interesting article by Dr. J. Konig, in which he sets out the nutritive value of many common articles of diet as determined by analysis, and compares this with the average price paid for such articles in the ordinary way. The comparison reveals some startling contrasts between the cost of many dishes and their nutritive value as food. As his standard of comparison, Dr. Konig first of all determined the value of a kilogramme of protein, fat, and hydrocarbons, taking pure hogs' lard and beef of good quality as representative of animal foods, and rye-meal and potatoes of vegetable substances. As a result he found the value per kilogramme as follows:

In animal foods.	In vegetable foods.
Albumen.....6.5 marks	1.50 marks
Fat.....2.0 "	0.45 "
Non-nitrogenous extractive matter.....—	0.25 "

He then proceeded to analyze a large number of different animal and vegetable foods, and arranged the results obtained in a tabular form, showing their comparative nutritive values as calculated on this basis. The prices of the various foods are appended in a parallel column, and thus a comparison can readily be drawn between the money value and the nutritive value of each article in the list. It is hardly necessary to point out that the selling prices in other localities may differ widely from those adopted by Dr. Konig as ruling in his immediate neighborhood, but the necessary correction for such discrepancies can be readily made, and the comparison between value as food and value as merchandise still easily drawn.

In the table below the values are calculated

in pfenningings, or tenths of a penny;

I.—Animal Food.

Description.	Nutritive Value.	Market Price.
Beef from medium ox, prime cuts.....	136.3	100
Second-class cuts.....	143.9	144

Incomplete as these figures necessarily are, as here curtailed, they nevertheless point to some facts of interest and importance to housekeepers. They show that meat from the several parts of a carcass has a very different composition, a fact, however, that has long been ascertained from other investigations. While the percentage of animal albumen varies but little, the proportions of water and fat differ widely, that of fat increasing as that of water diminishes. Hence the fat parts of a carcass are proportionately more valuable as food. The figures further show how little connection there is between price and value as food of the different articles examined. Varieties of food obtained from meat, either as smoked flesh or in the form of sausage, are much dearer in proportion than the fresh natural meat, costing more money and having a lower nutritive value. Milk and cheese are shown to be very cheap forms of food, and even the high price of butter is not greatly disproportionate to its nutritive value. As regards vegetable food, potatoes head the list as having a nutritive value more than equivalent to their price. Rye and wheat, again, are proportionately much cheaper than other cereals, and than buckwheat. The dearest forms of food of all, comparatively speaking, are table vegetables. Some of them are only to be regarded as expensive luxuries, judged as feeding material. Tea, chocolate and coffee have no appreciable nutritive value, and for practical purposes must be regarded as luxuries or delicacies only.

**BURNING GARBAGE.**—New York city has begun experiments with cremation of garbage thinking thus to better guard the city's health. The furnace to be used, in case the city enters into a contract for the cremation of all the garbage collected, will be 13 feet in diameter, 16 feet high, with a capacity of burning 1,000 loads of garbage and ashes in 24 hours. There will be six furnaces in different parts of the city, convenient for the garbage carts. During the three weeks the Seventh Ward contract has been in force, 300 loads of garbage have been consumed, and the opinion of those who live in the vicinity of the furnace, is that no unpleasant odor is emitted. The garbage, just as dumped, is shoveled into a furnace with large fires and a heavy blast beneath. Seventy-two loads a day are thus disposed of, and the entire work is performed by four laborers and an engineer. The gases evolved are passed into the boilers, and all unpleasant odors are consumed. Col. Foote, states that he has been informed by the Police Commissioners that it costs the city \$500 a day to tow out and dump 3,500 loads of garbage into the sea, and Mr. Foote believes, if the city undertake the cremation plan, the product will sell for enough to pay for the expense of the furnace. He states that he has been offered 20 cents a load for all the product he can deliver.

**A HOMEOPATHIC JOURNAL.**—As a matter of news to those of our readers who are of the homeopathic faith, we would state that we have been interested in perusing a copy of the *California Medical Times*, a quarterly journal of medical, surgical and sanitary science. It is edited by Drs. F. Hiller, Jr. and Sidney Worth, at 226 Post street, S. F. The magazine has a vigorous tone and doubtless will be welcomed by the homeopathic interest throughout the coast.

## Subscription and Advertising Rates:

ADVERTISING RATES.	1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	\$ 2.00	\$ 6.00
Half inch (1 square).	\$1.00	\$3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Four insertions are rated in a month.

SUBSCRIPTION IN ADVANCE.—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

Address all letters to the firm, and not to individual members, or others, who may at any time be absent.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, Nov. 10, 1877.

## TABLE OF CONTENTS.

**GENERAL EDITORIALS.**—Items of Interest from the Mines; Academy of Sciences; On the Death of Le-  
verrier; The "Devil's Gate"; Bulion Shipments; Paper  
Stock and Manufacture, 289. The Week; Timber of  
Mineral Lands; The Legislator and the Mines; Hay-  
den's Survey and the Archeology of the Southwest,  
296. Hydraulic Mining in California, 297-300. The  
Mining Share Market; The Arizona Bonanza; Du-  
hem & Bennett's Dry Placer Amalgamator; Technical  
Education of Miners; No Delay in Patent Business,  
300. Notices of Recent Patents; Patents and Inven-  
tions, 301.

**ILLUSTRATIONS.**—The Devil's Gate, Washoe,  
289. Section of Wall Ditch on a Line of La Grange  
Mining Co.'s Ditch; La Grange Ditch; North Bloomfield  
Ditch; Crossing of La Grange Flume at Indian Bar,  
297.

**CORRESPONDENCE.**—Harrisburg District; Weight  
of One Cubic Foot of Gold, 190.

**MECHANICAL PROGRESS.**—The Field Still  
Open for Inventors; The Jewelry Industry of the  
United States; Square Shoulders to Pivots; Progress;  
Keeley; Burnished Gilding on Glass; A Rock Boring  
Device; Incrusted Bronze, 291.

**SCIENTIFIC PROGRESS.**—Catastrophism; Cli-  
matic Changes in Europe; A River of Ink; What  
Hooker and Gray will Do; Combustion of Petroleum;  
Arctic Coal; New Specific Gravity Machine; Compressi-  
bility of Liquids; Seeds in Sea Water, 291.

**MINING SUMMARY.**—From the various counties  
of California, Nevada, Arizona, Oregon and Utah, 293-  
300.

**MINING STOCK MARKET.**—Sales at the San  
Francisco, Pacific and California Stock Boards; Notices  
of Assessments, Meetings and Dividends, 292.

**THE ENGINEER.**—Sounding for the Channel Tun-  
nel; The Hudson River Tunnel; New Docks on the  
Clyde; Curious Trunk-digging; A Great Work in Holland;  
Reclaiming the Everglades; Mr. Eads' Pay for the Jer-  
ties; Coupled-Leveling Instrument; Resistance of Rail-  
way Curves; A Stone Bridge, 294.

**USEFUL INFORMATION.**—Guarding the Snow  
Sheds; Curious Marks of Admixture in Wools; Waxed  
Paper; Post Office Dangers; The French Beet Sugar In-  
dustry, 295.

**GOOD HEALTH.**—Economy in Foods; Burning  
Garbage; A Homeopathic Journal, 295.

**MISCELLANEOUS.**—The Silver Caves of Peru; So-  
lution for Brightening Silver; The Legislature of 1877-8;  
Dangers of Coal Mining; Settling; Desert Land Inven-  
tigation; Immense Pipe Line Pump Station, 290. Lu-  
cky Strike; The North Calumet Mine; A Complete  
Mill; Japanese Mirrors; The Abuse of Saws, 294. Her-  
oines of the Hour; Realities; Russian Soldiers and  
the Bible, 295. Copper Mines on Snake River; The  
Fireside; Elephantine Vocalism; Bristol and Jackrabbits  
Districts; Iron Sailing Ships; Eberhardt and Aurora;  
Formation of Camel Coal; Montana Mining Items;  
New Motor, 298.

## NEW ADVERTISEMENTS.

Delinquent Notice—Mariposa Land and Mining Co.; As-  
sessment Notice—Excelsior Silver Mining Co.

## The Week.

The recent rains have dispelled any linger-  
ing fears of another dry winter and already  
a revival of business is noted. The hy-  
draulic miners throughout the State will soon be  
actively at work again, and the springs and  
rivers, as they commence to rise will start up  
many idle quartz mills. The principal item of  
interest in connection with mining matters this  
week has been the reported strike in the 1900-  
foot level of the Ophir mine, and the refusal of  
the Superintendent to allow an inspection of the  
mine by stockholders. There seems to be  
some mystery in connection with the matter  
which is not yet cleared up.

The Committee of Comstock mining superin-  
tendents appointed to inquire into the cost of  
pumping water, and to investigate other points  
connected with the Sutor tunnel question, held  
a meeting at the Chollar-Potosi office on Tues-  
day. There were present Superintendents Fair,  
Smith, Mackay, Requa, Patton, Schultz, For-  
man, Osbiston, Strother, Hardy, Gillette and  
Shepherd. The reports of the various superin-  
tendents were received and discussed. A *News*  
reporter interviewed Mr. Requa, chairman of  
the committee, and learned that it had been  
resolved not to make anything public until the  
report of the committee is submitted to the  
mine managers in San Francisco. Messrs.  
Requa and Patton were deputed to carry the  
report to San Francisco. They arrived here on  
Thursday night. As soon as the report is made  
public we will publish it.]

## Timber on Mineral Lands.

The bill introduced in Congress by Ex-Gov-  
ernor Pacheco, of this State, for the sale of  
timber land, exempts from its operations all  
lands containing minerals, and all settlers' im-  
provements. It also reserves all bona fide rights  
already attached under United States laws, and  
in regard to lands hereafter to be surveyed,  
gives actual occupants prior opportunities for  
purchase before offering lands for public sale.  
Each applicant for purchasing any quarter sec-  
tion already surveyed is required to make oath  
of his bona fide intention to appropriate the  
same for his own use, and not for sale, and that  
he has made no other application, and has not  
agreed in any way to transfer the title. Pacheco  
says he is not committed to every detail of the  
bill, and will ask its very careful consideration  
at the hands of the Public Lands Committee,  
of which he is a member.

The Government practically permits miners  
to cut timber on the public lands for mining  
purposes. On the even sections they cut as  
much as they see fit, and it is only when there  
is wanton waste that they are arrested. Most  
of this land, however, is now taken up by pri-  
vate parties. Manufacturers of lumber for  
mining purposes have bought up large tracts,  
and in most cases the miners now buy their  
timber. On the odd sections, or railroad lands,  
the miners have also been in the habit of cut-  
ting timber, although the Central Pacific Com-  
pany have brought several suits to prevent it.  
Mineral lands do not pass to the Central Pacific  
railroad by virtue of its grant, but the timber  
being or growing on mineral land, within ten  
miles of the center line of the road or its  
branches, was granted to said company, except  
so much as is necessary to support the improve-  
ments of mine owners upon the given tracts.  
The question is, how much is necessary? and in  
a number of instances suits have been brought.  
When patent issues for such mineral land, it is  
necessary to insert therein a clause excepting  
from the operation of the patent all timber  
being or growing upon odd-numbered sections  
within the limits referred to, except such "as is  
necessary to support his improvements as a  
miner."

However, the miners will continue to cut  
what timber is necessary for their business on  
either odd or even sections belonging to Govern-  
ment or railroad unless stopped by legal mea-  
sures. It is only high up in the mountains that  
much of this land is left, nearly all the rest  
having been purchased. Manufacturers of  
timber have bought from the railroad their  
rights in odd sections, and, of course, in such  
cases, they prevent the miners, as far as possi-  
ble, from cutting any timber at all.

The Commissioner of the General Land Office  
in his annual report, just filed, recommends  
that Congress withdraw all lands chiefly valu-  
able for pine timber from the operation of the  
homestead and pre-emption laws, and also from  
sale, except for cash; also that the Secretary of  
the interior be authorized to sell timber from  
the public lands in mining districts; also, to  
sell timber upon any unsurveyed land, not min-  
eral, when needed for actual settlement before  
public surveys; also, that a law be enacted pro-  
viding for the care and custody of timber lands  
unfit for agricultural purposes, and for the grad-  
ual sale, and for perpetuating the growth of  
timber on such lands. Legislation authorizing  
seizures of timber cut from public lands, with-  
out resort to the tedious processes of the courts,  
is also recommended.

## The Legislature and the Mines.

The State Legislature will convene at Sacra-  
mento in a short time and if our mining friends  
have any suggestions to make to the members  
they can commence putting on their thinking  
caps and prepare their arguments. The Legis-  
lature itself cannot make any changes in the  
mining laws, but can memorialize Congress on  
the subject. It can, however, take cognizance  
of stock gambling, and endeavor to remedy  
some of the evils connected with it. Perhaps  
the Palace Hotel Reform Committee, which was  
to make a great change in the methods of deal-  
ing in stocks, but has done nothing as yet, may  
have a chance to come forward with some valu-  
able suggestions for reform. Still, as they have  
not done so, those of our readers who have had  
any experience on the subject can ventilate  
their views in the *PRESS*. Our columns are  
open to the discussion of all subjects of this  
character.

Our legislative friends who are desirous of  
really benefiting the mining interests, can see  
what the working miners think by reading the  
*PRESS*. If they have little or no knowledge of the  
subject, they can speedily post themselves by a  
perusal of our columns from week to week, and  
in case any controversy affecting the miners is  
carried on, they may be able to judge of its  
merits by reading the discussions carried on by  
those interested. Several questions of vital  
importance will come up at the present session  
of the Legislature, and the members owe it to  
themselves and to their constituents to thor-  
oughly understand the matters in all their bear-  
ings before casting their votes. We shall en-  
deavor, as far as lies in our power, to throw  
what light we can on these subjects, and are  
anxious that our readers should contribute as  
far as possible to the same end.

Hayden's Survey and the Archeology of  
the Southwest.

Up to the year 1874 rumor had been telling  
many marvelous stories of strange and interest-  
ing habitations of a forgotten people who once  
occupied the country about the headwaters of  
the Rio San Juan, but these narrations were so  
interwoven with romance that but few people  
placed much reliance upon them. To those well  
versed in archeology, ruins of an extensive and  
interesting character were known to exist  
throughout New Mexico and Arizona, and the  
various reports of Albert Johnson, Sitgreaves,  
Simpson, Whipple, Newberry and others, forms  
a most interesting chapter in ancient American  
history; but their researches, aside from the  
meager accounts published by Newberry, threw  
no light on the marvelous cliff dwellings and  
towns north of the San Juan.

In 1874 the photographic division of the  
United States Geological Survey was instructed,  
in connection with its regular work, to visit  
and report upon these ruins, and in pursuance  
of this object made a hasty tour of the region  
about the Mesa Verde and the Sierra El Late in  
southwestern Colorado, the results of which trip,  
as expressed by Bancroft in the "Native Races of  
the Pacific Coast": "Although made known to  
the world only through a three or four day's  
exploration by a party of three men, are of  
the greatest importance." A report was made  
and published with 14 illustrations in the Bulle-  
tin of the United States Geological and Geo-  
graphical Survey of the Territories, Second  
Series No. 1, and some of the engravings were  
recently reproduced in our columns.

The following year the same region was vis-  
ited by Mr. W. H. Holmes, one of the geolo-  
gists of the Hayden survey, and a careful in-  
vestigation made of all the ruins. Mr. Jackson,  
who had made the report the previous year,  
also revisited this locality, and extended his ex-  
plorations down the San Juan to the mouth of  
the DeChelly, and thence to the Moqui villages  
in northeastern Arizona. Returning, the  
country between the Sierra Ahajo and La Sal,  
and the La Plata was traversed, and an immense  
number of very interesting ruins were first  
brought to the attention of the outside world  
by the report which was published the follow-  
ing winter by Messrs. Holmes and Jackson in  
the Bulletin of the United States Geological and  
Geographical Survey of the Territories, vol. ii.  
No. 1.

The occasion of the Centennial exhibition at  
Philadelphia, led to the idea of preparing  
models of these ruins, for the clearer illustra-  
tion of their peculiarities, four of which were  
completed in season for the opening of the ex-  
hibition. The first was made by Mr. Holmes  
with whom the idea originated, and represents  
the "Cliff house of the Mancos canyon," the  
exterior dimensions of which are 28 inches in  
breadth by 46 inches in height, and the scale  
1 to 24; or two feet to the inch. This is a two-  
story building constructed of stone, occupying  
a narrow ledge in the vertical face of the bluff,  
700 feet above the valley, and 200 feet from the  
top. It is 24 feet in length and 14 feet in depth,  
divided into four rooms on the ground floor.  
The beams supporting the second floor are all  
destroyed. The doorways, serving also as win-  
dows, were quite small, only one small aperture  
in the outer wall facing the valley. The ex-  
posed walls were lightly plastered over with  
clay and so closely resembled the general sur-  
face of the bluff that it becomes exceedingly  
difficult to distinguish them at a little distance  
from their surroundings.

The second model of this series was con-  
structed by Mr. Jackson, and represents the  
large "Cave town in the valley of the Rio de  
Chelly," near its junction with the San Juan.  
This town is located upon a narrow bench occur-  
ing about 80 feet above the base of a perpendic-  
ular bluff some 300 feet in height. It is 545 feet  
in length, about 40 feet at its greatest depth,  
and shows about 75 apartments on its ground  
plan. The left hand third of the town, as we  
face it, is overhung some distance by the bluff,  
protecting the buildings beneath much more  
perfectly than the others. This is the portion  
represented by the model. A three-story tower  
forms the central feature; upon either side are  
rows of lesser buildings, built one above another  
upon the sloping floor of rock. Nearly all these  
buildings are in a fair state of preservation.  
This model is 37 by 47 inches, outside measure-  
ment, and the scale 1 to 72, or six feet to the  
inch.

A "Restoration" of the above forms the third  
in the series—of the same size and scale—and is  
intended, as its name implies, to represent as  
nearly as possible the original condition of the  
ruin. In this we see that the approaches were  
made by ladders and steps hewn in the rock,  
and that the roof of one tier of rooms served as  
a terrace for those back of them, showing a  
similarity, at least in their construction, to the  
works of the Pueblos in New Mexico and  
Arizona. Scattered about over the buildings  
are miniature representations of the people at  
their various occupations, with pottery and  
other domestic utensils.

The "Triple-Walled Tower," at the head of  
the McElmo, is the subject of the fourth model.  
It was constructed by Mr. Holmes and repre-  
sents, as indicated by its title, a triple-walled

tower, situated in the midst of a considerable  
extent of lesser ruins, probably of dwellings,  
occupying a low bench bordering the dry-wash  
of the McElmo. The tower is 42 feet in diameter,  
the wall two-feet thick, and now standing some  
12 feet high. The two outer walls enclose a  
space of six feet in width, which is divided  
into 14 equally sized rooms, communicating  
with one another by small window-like door-  
ways. The above are all that were exhibited at  
Philadelphia; since then others have been made  
by Mr. Jackson, as follows:

"A Cliff House in the valley of the Rio de  
Chelly." It is about 20 miles above the cave  
town already spoken of. This is a two-story  
house, about 20 feet square, occupying a ledge  
some 75 feet above the valley and overhung by  
the bluff. The approach from the valley is by  
a series of steps hewn in the steep face of the  
rock, and this method was the one most used  
by the occupants, although there is a way out  
to the top of the bluff. This model is 42 inches  
in height by 24 broad, and is built upon a scale  
of 1 to 36.

"Tiwa," one of the seven Moqui towns in  
northeastern Arizona, is a very interesting and  
instructive model, representing as it does one of  
the most ancient and best authenticated of the  
dwellings of a people who are supposed to be the  
descendants of the cliff dwellers. Tiwa is the  
first of the seven villages forming the province,  
as we approach them from the east, and occu-  
pies the summit of a narrow mesa some 600 feet  
in height and 1,200 yards in length, upon which  
are also two other somewhat similar villages.  
The approach is by a circuitous roadway hewn  
in the perpendicular face of the bluff, which  
surrounds the mesa on all sides; it is the only  
approach accessible for animals to the three  
villages. Other ladder-like stairways are cut  
in the rock, which are used principally by the  
water carriers, for all their springs and reser-  
voirs are at the bottom of the mesa. This vil-  
lage is represented upon a scale of one inch to  
eight feet or 1 to 96. The dimensions of the  
model are 36 inches in length, 29 inches in  
width and 14 inches high.

In the spring of 1877 Mr. Jackson made a  
tour over much of the northern part of New  
Mexico and westward to the Moqui towns in  
Arizona, and secured materials for a number of  
very interesting models, illustrating the meth-  
ods of the Pueblos or Town Builders in the con-  
struction of their dwellings. Two villages have  
been selected for immediate construction, as  
showing the most ancient and best known ex-  
amples of their peculiar architecture, viz.: Taos  
and Acoma, the one of many storied, terraced  
houses, and the other built high up on an im-  
penetrable rock.

The model of Taos is now completed, the  
dimensions of which are 42 by 39 inches, and  
the scale one inch to 20 feet. Of this town  
Davis says: "It is the best sample of the an-  
cient mode of building. Here are two large  
houses, 300 or 400 feet in length, and about 150  
feet wide at the base. They are situated upon  
opposite sides of a small creek, and in ancient  
times are said to have been connected with a  
bridge. They are five and six stories high, each  
story receding from the one below it, and thus  
forming a structure terraced from top to bottom.  
Each story is divided into numerous little com-  
partments, the outer tier of rooms being light-  
ed by small windows in the sides, while those  
in the interior of the building are dark and are  
principally used as store-rooms. The only  
means of entrance is through a trap door in the  
roof, and you ascend from story to story by  
means of ladders on the outside, which are  
drawn up at night."

Their contact with Europeans has modified  
somewhat their ancient style of buildings, prin-  
cipally in substituting doorways in the walls of  
their houses for those in the roof. Their mod-  
ern buildings are rarely over two stories in  
height, and are not distinguishable from those of  
their Mexican neighbors. The village is sur-  
rounded by an adobe wall, which is just includ-  
ed within the limits of the model, and incloses  
an area of 11 or 12 acres in extent. Within  
this limit are four of their *casufas*, or secret  
council houses. These are circular, under-  
ground apartments, with a narrow opening in  
the roof, surrounded by a palisade, ladders  
being used to go in and out.

These models are first carefully built up in  
clay, in which material all the detail is readily  
secured, and are then cast in plaster, a mold  
being secured by which they are readily multi-  
plied to any extent. They are then put in the  
hands of the artists and carefully colored in solid  
oil paints to accurately resemble their appear-  
ance in nature, and in the case of restorations,  
or modern buildings, all the little additions are  
made which will give the appearance of occu-  
pation.

The survey is in possession of the data for the  
construction of many more models, and they  
will be brought out as opportunity is given.  
They have also in connection with the ruins,  
multiplied many of the curious pieces of pot-  
tery which have been brought back from that  
region by the various parties connected with the  
survey.

MANY prominent dignitaries in Constanti-  
nople have been arrested by order of the Grand  
Vizier. It is said that a conspiracy on the part  
of a party of ex-Sultan Murad has been dis-  
covered.

OUR Oregon agent, Mr. E. M. Deuny, has  
been heard from at the Dalles, and we soon ex-  
pect some correspondence for the *PRESS* from  
our flourishing sister State.

## Copper Mines on Snake River.

Mr. Levi Allen, an early pioneer of this Territory, but latterly a resident of Helena, Montana Territory, called on us yesterday on his return trip from his copper mines on Snake river. These mines are located about halfway between Brown Lee's ferry and Pittsburg landing, and six miles back from Snake river. The first copper mine in this section was discovered by Mr. Allen in 1862. He came over with a large party from North Idaho, within 16 miles of Boise basin, two months before Grime's party discovered gold near Hogau, now Pioneer, in August, 1862. Mr. Allen's party was making for Boise basin, but the number of men in the party were too many, and they got up dissensions about the routes they were to take, and broke up. A small party went with Allen to prospect the country lying between the Salmon and Snake river. In their travels they struck this copper lead. Copper was not counted worth much in those days, but Allen was satisfied this was a true lead, very rich and inexhaustible. The following summer he came to Boise county, and lived in Boise city in 1864. Since that time he has been most of the time in Montana. He has made frequent visits to this mine and done the necessary work to hold it. He was back last spring and intended to do a good deal of work this summer, but the Nez Perce Indian war broke out so he left and went back to Montana.

There is considerable copper ore in that Territory, and such mines are counted safer than gold mines, while they are not looked after much in Idaho. On Mr. Allen's representations, several wealthy gentlemen of Helena made propositions to buy this mine, and Prof. Isaac R. Lewis, Superintendent of several mining companies in that Territory, came out with Mr. Allen to examine the mine and report, and they are now on their return home. The mine has been relocated under the United States laws, and consists of 1,500 feet in length, and 600 feet in width, and is called the Peacock copper mine. It is 120 feet wide, and there is a shaft down 40 feet. The ore as it is taken out runs from 40 to 85 per cent. in copper. Chunks or boulders of ore are found weighing several tons, which will yield 85 per cent. of pure copper. There are over 500 tons of ore that will yield 50 per cent. that can be packed up and sacked without any labor in extracting the ore. Prof. Lewis is well pleased with the mine, and says it is better than Mr. Allen represented it. If it is not sold on their return he will take an interest with Mr. Allen, and they will return in the spring and work from 75 to 100 men on the mine. They expect the outlet will be down Snake river; pack or haul the ore to Pittsburg landing, and then send it by boats down the Snake and Columbia rivers to Portland. Mr. Allen and Lewis located another copper lode three miles from the Peacock, which they think will prove rich, and have named it the White Monument. The base metal lead of Abernathy & Co. lies about 12 miles south of this place and the Heath silver district is 12 miles further south, all in the same range and belt of mineral country. Our personal knowledge of this section leads us to believe that extensive mining operations will soon be carried on in that region. —*Idaho Statesman.*

**THE FIRESIDE.**—The fireside is a seminary of infinite importance. It is important because it is universal, and because the education it bestows, being woven with the woof of childhood, gives form and color to the texture of life. There are few who can receive the honors of college, but all are graduates of the hearth. The learning of the university may fade from recollection, its classic lore may molder in the halls of memory; but the simple lessons of home, enameled upon the heart of childhood, defy the rust of years, and outlive the more mature but less vivid pictures of after days. So deep, so lasting, indeed, are the impressions of early life, that you often see a man in the imbecility of age holding fresh in his recollection the events of childhood, while all the wide space between that and the present hour is a blasted and forgotten waste. You have, perchance, seen an old and half-obliterated portrait, and in attempting to have it cleaned and restored, you may have seen it fade away, while a brighter and more perfect picture painted beneath is revealed to view. This portrait, first drawn upon the canvas, is no inapt illustration of youth; and though it may be concealed by some after design, still the original traits will shine through the outward picture, giving it tone while fresh, and surviving it in decay. Such is the fireside—the great institution furnished by Providence to educate men. —*Journal of Education.*

**ELEPHANTINE VOCALISM.**—A recent traveler states that the elephant emits four distinct sounds, each of which expresses a certain state of feeling or thought. The first is an acute and whistling cry, produced by a blast sent through the trunk; the animal thus shows his contentment. To indicate surprise or alarm he makes with his mouth, a noise which is like *pr-rut, pr-rut*. A sound like that of a trumpet, and given with force, indicates anger. When the elephant is furious, or when he rushes on an assailant, the sound changes to a hoarse hellow, or a terrible cry. The fourth sound denotes discontentment or distress; it is frequently repeated by the animal when separated from the rest of the herd, tired, famished, or too heavily loaded; it may be imitated by *urmph, urmph*.

## Bristol and Jackrabbit Districts.

The developments made in the Day mine have caused owners of mines in Bristol district to renew exertions in the development of mines owned by them, which mines had only been partially worked for some time past. All have commenced work in a systematic manner, the exertions made in that respect proving that there has lain dormant for some time a class of mining property that only needed a little work to prove it valuable.

In the Cave mine, owned by the Rowe Brothers, a development has shown that the vein carries a large amount of silver along with the copper, for which it has always been worked. The Richards' mine, of which A. J. Blair is part owner, is now being worked vigorously in consequence, and is making a good showing. The Sultan mine is also putting in goodicks, the owners thinking they have got a No. 1 mine. At the Mayflower work is being pushed night and day, ore being taken out rapidly and sacked. The body of ore is large and of good quality, as shown by the various assays of the same. Before long we will have a working of ore from this mine which will show to every one that the stockholders were not amiss in keeping up steady work on it. The Bay State, and other mines in Bristol district, we have learned nothing of lately.

In the Jackrabbit district the Day mine is still holding its own, besides getting 43 tons of first and second class ores worked at the Raymond & Ely mill. The work of running the tunnels still continues, about 25 men being employed day and night in placing the mine in good shape, and further developing it. The Junction mine, owned by Press, Wand, J. O. McCormick and others, have struck a body of ore, assays from which show over \$100 per ton, and improving as work continues. The owners think they have a good mine, and are sticking to it and pressing work ahead. The Senator mine, Drolette, Clymo and Lynch owners, are prosecuting work vigorously, and the mines are improving rapidly. There are numerous other mines in the Jackrabbit mining district which we could mention that are all making a fair showing for their owners, but we reserve them until further developments have been made.

The work being done and the developments being made show that these two districts will be of immense importance in mining circles before a great while. —*Pioche Record.*

**IRON SAILING SHIPS.**—The New York *Tribune* says that "up to last year only one iron sailing ship had been built in the United States. There were iron shipyards enough, and competent builders, and the builders were offering to construct vessels as cheap as they could be bought abroad, and as an illustration of what they could do in shipbuilding they have been producing some of the fleetest, staunchest, and most beautiful iron steamships which sail in and out of the ports of the United States, but no one ordered an American iron sailing ship. From various causes shipmasters were content with wood. There now begins to be an inquiry, however, concerning American iron ships. The state ment that such vessels can be built as cheaply in this country as abroad has attracted wide attention, and a prominent builder is now in receipt of letters from Boston and Liverpool, saying that if he can build iron sailing vessels at the rates claimed, the writers will certainly order ships from him. The rate in England for a first-class iron vessel of, say, 1,000 tons burden, with a double outfit of sails, is about £9 per ton, the offer is made to construct the same sort of ship precisely for \$45 a ton, in currency, and negotiations are now in progress in regard to the matter.

**EBERHARDT AND AURORA.**—*Eureka Sentinel* Oct. 28: We are in receipt of reliable information confirming the development in the Eberhardt and Aurora tunnel, in White Pine. The strike was made at a distance of 2,100 feet from the mouth of the tunnel. At latest accounts the whole face of the tunnel, which is 9x14 feet, was in good ore, assaying \$100 per ton. Great importance attaches to this discovery, as it establishes the depth and permanency of the mines of Treasure Hill beyond any reasonable doubt. We may now hope to see White Pine take on something of her former prosperity. The ores of that section are the richest and freest in the State, and the only question hitherto has been one of depth. The strike in the Eberhardt and Aurora tunnel settles that matter, and it is not improbable that hundreds of old White Piners will now hasten back to look after mines that have long remained idle.

**FORMATION OF CANNEL COAL.**—A discovery has been made in Australia which confirms with singular minuteness the theory that assigns to the cannel coal an origin from leaves. It is difficult to understand how leaves can accumulate free from dirt in sufficient quantity to form beds of cannel coal, now several feet thick, and representing their mass many times in leaves. But in Australia just such a mass of leaves have been found, partially but not completely altered to cannel. The appearance and fracture of fresh blocks are the same as of this kind of coal found elsewhere, but after several years exposure it can be separated into thin laminae, which shows that the mass is composed principally of leaves. The bed is six feet thick, and the government geologists call it "incipient lignite."

## Montana Mining Items.

The shaft on the Burlington is now down 115 feet. The crevice at that depth is three feet and a half wide, very clearly defined, and yields ore at least as high a grade as any ever taken from the lode. There is very little water, and the shaft is still going down.

The double whim on the western shaft of the Lexington is completed and has been in operation for something over a week. The shaft is an incline, having a pitch of 45° and the ore is hoisted in regular ore cars instead of clumsy buckets.

The Centennial mill will probably remain idle for some time. Mr. Howe is going to San Francisco and St. Louis to raise funds to enable him to run the mill.

The Green Campbell mill, at Silver Star, has changed hands. Its present owners are Messrs. Morris and Johnson, of Virginia City, and Col. W. F. Saunders, of Helena. The new owners have refitted and put in good order their mill by adding two new settlers and removing the four Horn pans formerly in use. The mill is now running on ore from the Broadway lode. The above-named gentlemen, together with Mr. F. R. Merk, own one-half the mine and Messrs. Dabler, Largey and others the other half—according to the late decision of the court. The mill has ten stamps and a capacity of from 12 to 15 tons of ore per day, and is well adapted for working gold ores. There are 500 tons of ore on the dump, with plenty more in sight, and when the two companies can agree upon a basis of working this valuable mine, their respective mills at Iron Rod and Silver Star can be kept running constantly, and at a fair profit to their owners, as the ore mills from \$12 to \$30 per ton. The Green Campbell started up on the 17th ult. —*Butte Miner.*

**NEW MOTOR.**—An improved motor, which depends for its action upon the well-known law of the increase of pressure of a fluid jet as its velocity is diminished, has been invented by Mr. R. Adams, of Coathbridge, England. The motor consists of a wheel or disc carried on a revolving shaft, and contained within a closed casing in which it is free to rotate. The wheel or disc is formed at its circumference with teeth, which are straight on one side and curved or inclined on the opposite side. At a point in the circumference of the casing between the interior of which and the circumference of the wheel there is a clear or free space, a nozzle of a small hose is situated longitudinally or approximately so, and this being in connection with a source of water supply at high pressure admits a small jet of water at the high velocity corresponding to the pressure to the interior of the casing. This jet of water after it escapes from the nozzle strikes (at a tangent or nearly so) the straight side of the teeth in the circumference of the wheel or disc, and its velocity becoming reduced it escapes by the outflow formed at an opposite point or other part of the casing. The inclined or curved side of the teeth in the wheel or disc enables it to rotate in the water with a minimum of retardation.

WOODWARD'S OARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

## HOW TO ADVERTISE.

The following views of some of our most successful business men, says an exchange, will be very generally concurred in:

"The laundry lithographs so freely used by certain manufacturers neither express good sense nor good taste; they suffer even by comparison with the comic valentine, for although the latter is essentially vulgar, and frequently a hurtful missile in the hands of a foolish or a malicious person, it means something; it has about it some touch of humor—it tells for what it was designed. But the stove manufacturers' valentine, I mean the red and yellow lithograph, has no redeeming qualities about it. At best, it but announces the thoughtlessness or want of dignity of its author; and if it does not hint with a certain degree of positiveness at the probable inferiority of its wares, it is less injurious than I have been inclined to regard it."

"Fence advertising cannot be too emphatically condemned; to characterize it as vile is scarcely to do it adequate justice. It is primarily objectionable, because it brings the manufacturers who wish to advertise into doubtful company on the public highway; and every prudent business man must know, if he has given to his advertising the careful attention it deserves, that the money devoted to papering fences is utterly wasted. We know a gentleman who expends \$150,000 annually for advertising, but you cannot find his name on the fences; he is the best advertiser in the country, but there is nothing comical or grotesque about his way of doing business."

"The glaring poster neither inspires confidence nor conveys the information the public desire; and if it would make the best possible use of our money in giving publicity to our claims as manufacturers, we should patronize able and responsible newspapers. The newspaper is immeasurably the best medium open to our trade; the most liberal and expert advertisers testify to its value; and in the employment of its columns we would find a means of escape from the wasteful, undignified and ineffective methods to which so many now resort in their eager desire to secure attention and patronage."

## OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THOMPSON—San Francisco.  
B. W. CROWELL—California.  
A. C. KNOX—Pacific Coast.  
C. N. WEST—Santa Cruz, Monterey and San Benito counties.  
A. C. CHAMPION—Tulare, Fresno and Inyo counties.  
JOSEPH DUMICK—Mendocino, Humboldt and Del Norte counties, and Oregon.  
W. D. WHITE—San Bernardino and Los Angeles counties.  
J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.  
B. E. LLOYD—Alameda, Contra Costa and Napa counties.  
E. M. DENNY, Oregon.  
F. B. ALDERSON, Nevada.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly. The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to book binding.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 15, 22, 26, 30 and 34 inches, inside measure.

Single samples will be mailed from this office for 50 cents, postpaid. Wholesale and retail agents wanted.

**CAUTION  
TO HYDRAULIC MINERS.**

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 10th of May, 1876, and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

**HENRY C. PERKINS,**  
 North Bloomfield Nevada County, Cal.

**SCRIBNER'S  
LUMBER and LOG-BOOK.**

OVER HALF A MILLION SOLD.

Most complete book of its kind ever published. Gives correct measurement of all kinds of lumber, logs and plank by Doyle's rule, cubical contents of square and round timber, stave and heading bolt tables, wages, rent, board, capacity of cisterns, cord-wood tables, interest, etc. Standard book throughout United States and Canada. Ask your bookseller for it, or I will send one for 35 cents, post-paid. G. W. FISHER, P. O. Box 235, Rochester, N. Y.

SOLD ON THE PACIFIC COAST BY

**DEWEY & CO., San Francisco,**

And mailed post-paid on receipt of 35 cents in currency or postage stamps.

**To Mill and Mine Owners.**

Having made arrangements with competent and reliable parties in Washington City, by which we will be able to secure prompt and careful attention to our business, we are now prepared to assist Mill and Mine, Canal and Ditch owners in securing patents for their lands, mines and claims, in addition to our former line of patent business.

Many who are acquainted with the manner in which this business has heretofore been conducted, (with or without assistance by local attorneys,) will see at once the great advantage of patronizing an establishment that is thoroughly organized and has its representatives in Washington to look after and prosecute their applications before the Commissioner of the General Land Office. The business on this Coast will be attended to by **JOHN L. BOONE, Esq., Attorney-at-Law**, one of the members of this firm.

Correspondence from persons desirous of securing patents for Lands, Mines, Mill Sites, Canal and Ditch property, promptly attended to.

**DEWEY & CO.**

Solicitors of Patents for Lands, Mines and Inventions,

MINING AND SCIENTIFIC PRESS OFFICE,

No. 202 Sansome St., S. F.

We have the best Imitation Gold Watch in the Market for Trading Purposes. The metal is a composition of other metals, and only resembling gold that the best judges find it difficult to detect the difference, except by a chemical test, and it has the virtues requisite to make it the best substitute for gold known. GENUINE AMERICAN MOVEMENT. EXPANSION BALANCE. BEAUTIFULLY ENGRAVED OR ENGINE TURNED HUNTING CASES, and equal in appearance to a GOLD WATCH THAT COSTS FROM \$150 TO \$200. It sells and trades readily, for from \$60 to \$100, and if you wish a watch for your own use or to make money on, try this. Owing to our large sales, we are enabled to reduce the price of them to \$12 each with an elegant Chain attached. They are used on Railroads, Steamers, and in Manufactories, and other places where accurate time is required, and gives general satisfaction. We send them by Mail or Express, on receipt of \$12, to any part of the Country, or it will be sent C.O.D. when the customer desires and remits \$3 on account. These elegant CHAINS weigh about Fifty Pennyweights, and the same pattern in pure gold would cost \$100. We sell those Chains at \$2 each. But we sell the Watch and Chain for \$12, sent by Mail in a Registered Package, post-paid, to any Post Office in the United States.

WE SELL THE WATCH WITHOUT THE CHAIN FOR \$10.

Continued from Page 293.

shipped 6,500 pounds of ore which the owners say is from the same pay streak as that from which the former owners sold one ton in San Francisco for over \$18,000. This is said to be a better lot of ore than that exhibited here of which we spoke last week. We are told that \$3,200 will pay the expenses of taking out this ore, boxing and shipping it to this place.

**LITTLE SPRING MINE.**—*Arizona Miner*, Oct. 27: Messrs. Gudgeon & Winslow have recently taken out some excellent ore from the Little Spring mine, situated about three miles east of town. Assays from ordinary ore gives the value at \$353 to the ton.

**BIO BUE.**—We learn that the Messrs. Devore & McMichael, who purchased the Clifton mine from Charles E. Hitchcock for \$1,000 about two months since, have been taking out weekly since that time, by anastha process, \$100 per week.

Work on the Adel mine, about five miles south of town, is progressing nicely and it is yielding a large quantity of ore which assays \$175 to the ton.

## Oregon.

**THE TELLURUM MINES.**—*Oregonian*, Nov. 3: Mr. I. N. Miles, of Canyonville, Douglas county, has been in the city during the past week for the purpose of interesting capital to aid in the development of the several rich lodes of the Tellurium mining company. These mines are only about two and a half miles from Canyonville, and are said to be of great richness and extent. There are six well-defined lodes, specimens of which have been assayed and found to yield largely of gold, silver and copper. Several shafts have been sunk, one to the depth of 50 feet. At present a force of 15 men are engaged day and night in working these mines, and already 100 tons of the rock have been got out. The furnace has been completed and will soon be in working order.

**LUCY QUEEN.**—A meeting of the Directors of this company was held in Roseburg on the 19th. It was ordered that work on the mine be commenced and the water taken from the shaft, preparatory to sinking to a greater depth and getting out ore from the mine, and that material be purchased for erecting a roasting and chlorizing furnace. Prof. J. M. Tiernan, mining engineer of this city, has been engaged to inspect and work the mine.

The Emeline quicksilver company, in Jackson, have shut down their retort until next spring. Work on the vein continues.

**QUARTZ MINES** on the Pebastin (Yakima) are still thought to be valuable, but owing to lack of capital their development is rather slow.

The placer claim of Baisley & Bulger, near Pochontas, Baker county, yielded \$11,000 as a result of six months' run. It was done with hydraulic pipe and the labor of four men.

Two mining companies at Spanish gulch, on the road between here and Canyon City, cleaned up, a few days ago, \$6,000 in gold dust. This was the second clean-up this season.

**SALT LAKE MINES.**—*Willamette Farmer*, Nov. 3: Mr. Frank Glover, of the Capital Mining company, arrived in the city yesterday and reports work progressing rapidly on the shaft which is being sunk to give ventilation to the tunnel. He also reports good work being done in the Nonpareil mines, which lie a short distance from the Capital lead.

## Utah.

**LITTLE COTTONWOOD.**—*Salt Lake Tribune*, Nov. 3: The Emma continues to make regular shipments of high-grade ore, which is sampled at the Pioneer mills and sold to the Sundry smelters. The Carbonate shows up bigger than ever, each foot of development adding value to the property and profit to the owners. Indeed, it is now believed that the mine will develop into the grandest piece of mining property on the Pacific coast. The grade of the ore keeps up in silver and lead, and bids fair to knock the spots off the Eureka, Nev., mines next season. Mr. John McDonald, the old-time recorder of Little Cottonwood, has made a new and rich discovery just below the Flag-staff dump, which promises to be a second Emma. What the extent of the vein is and the assay value of the ore we have not learned, but those who have visited the new prospect say that Mac has struck it big at last.

## The Mining Share Market.

A little life has been infused into the market of the past week by reported developments in the east crosscut of the 1900-foot level of the Ophir mine, backed by an improvement in the 1750-foot level of the Consolidated Virginia. What these strikes amount to is a matter of profound mystery to the general public, as both mines have been closed to visitors, pending the examination of "inside" experts, who have flocked to Virginia. Considerable complaint is made that the lesser stockholders are not permitted to see for themselves. According to law any one representing a one-hundredth interest in a mine can demand and secure admittance to it, and so the lesser stockholders can, of course, obtain their own reports by combining and bringing together sufficient stock. Meanwhile the news, while not authoritatively verified, has had its influence on the market, and has caused a small spurt in Ophir, which has not been sympathized in to any great extent by the other stocks. Of the outside stocks, Grand Prize, of Tuscarora, has been the sensation, making a break to \$10.50 on Wednesday, under heavy pressure.

**THE ARIZONA BONANZA.**—We are asked for further information concerning the "Arizona bonanza," of which we spoke last week; and whether, notwithstanding the very rich ore, there is not stock for sale in the company? We have never seen the mine and are, therefore, not competent to pass on its merits. The information published, we derived, as stated, from the superintendent who is now in town. We have no knowledge of the value of the stock or the value of the mine outside of seeing the ore which, of itself, is a massive showing.

**LUTTRELL'S bill** in Congress for the introduction of fresh water on the desert west of Fort Yuma is the Wozencraft measure of last session, with two modifications. The first provides that the Secretary of the Interior shall appoint three competent persons to appraise the present value of the lands, and that Wozencraft and his associates shall pay for them at such appraised valuation before acquiring title. The second amendment provides that water rates, to be fixed by the army engineer detailed by the Secretary of War for the examination of the work, as it progresses. The bill requires the work to be commenced within two years and completed in 10.

## Duhem & Bennett's Dry Placer Amalgamator.

**EDITORS PRESS:**—We are in receipt, through your having noticed the "dry placer amalgamator," of numberless inquiries as to the construction, capacity, operation and cost of the machines. We send to your address a copy of the *Mining Record*, in which is an answer to all these questions by a disinterested eye-witness, Mr. J. Vandemoer. If you will be kind enough to copy, you will furnish information much desired by many readers of your truly valuable journal.

DUHEM &amp; BENNETT.

Denver, Colorado, Oct. 25th, 1877.

In my former letters I have several times briefly referred to the so-called "dry placer amalgamator," but with the fear that like its many predecessors, it would fail to warrant the high expectations entertained of it by the inventors, Messrs. Duhem & Bennett of this city. I am agreeably disappointed, however, in this respect, and may say that the machine, by actual working in the mine, has proven itself to be not only all that the inventors have claimed, but more. This, of course, opens up a new field of industry, which will furnish employment to thousands of men, and bring into market at high figures many thousands of acres, indeed, I might say, square miles of hitherto worthless mines, though rich in the precious metal, because they were entirely unavailable by any of the methods in use for extracting the gold. It is well known that, without a large and continuous supply of water, placer gold cannot be saved by the hydraulic or sluice. It is equally well known, that only the heavy gold can be saved by these methods. Every placer mine has a proportion of fine gold, which is invariably carried off by the sluice stream. It is a fact conceded by all experienced sluice miners, that mining operations in the upper waters of a stream in the course of a year or two, will produce profitable placers in the bars or bends below, so imperfectly do these contrivances for saving the gold perform their work. In fact, tailing mines are worked with much profit, wherever they exist, though the gold of course is much finer than in the original deposit, and much is again lost. The dry placer amalgamator is intended not only to work ground which is lacking in water supply, but to save both the coarse and the fine gold. Much doubt was entertained as to the possibility of handling with the machine a sufficient amount of dirt to make it profitable even though all the gold were saved. The practical test has settled this question.

The machine, substantially constructed, mostly of iron, and weighing about 4,000 pounds, is mounted permanently on wheels. It is accompanied with an eight-horse-power engine and boiler, also mounted, so that the whole is extremely portable. An automatic feeder passes the dirt into a partly submerged, revolving cylindrical grate and sieve, in which such coarse material as stones, gravel, etc., are separated from the finer, most thoroughly scoured, and thrown out as part of the tailings. The finer particles pass through the grate and sieve, dropping through water to the sides and bottom of a main tank, which is lined with amalgam plates; here it is received by a series of water jets which throw it upward and forward toward the tailing end of the tank. Each time that it is thus thrown, it falls on a new spot on the plates, but each time a little nearer the tailing tank, in which it is finally thrown; thence it is taken, drained, and thrown out by a simple arrangement. In passing from one end to the other the sand passes over 26 of these jets. The heavy gold settles at once between and below the jets, and is not again disturbed until the clean-up. The machine which I have seen working in South Park, on an abandoned mine, handles from 80 to 100 cubic yards per day, by actual measurement. And though constantly tested by parties who seek to reach the truth, no gold has yet been detected in its tailings.

The mine upon which the trial machine is placed had been tried with the sluice, and abandoned, the two men having cleaned up less than \$6 for their joint labor for six days. This, together with the fact that on this mine could be found various kinds of dirt, renders it the best spot that could be selected for a thorough and severe test. The machine is taking out from this mine from \$125 to \$150 per week, at a necessary expense of about \$60 to \$75 per week. In conversation with the proprietors, we were informed that the present machine is extremely faulty as compared with future machines, and that, without perceptibly increasing their size or weight, they will increase their capacity to upwards of 100 cubic yards per day of 10 hours.

A number of machines are already contracted for by parties who have watched its operation. It is the purpose of the proprietors to organize a stock company in each gold-bearing State and Territory, as fast as capital comes forward, to manufacture, use, and rent out in its own State or Territory, machines under their patents. The company for this State is already organized, and its prospectus will soon be in print. It is understood that the rent charged by this company will be \$100 per week, and many parties are ready to take them at that rate. This may seem a high price, but, when it is taken into consideration that the say 40 inches of water required to run 40 yards of dirt per day, will supply 20 of these machines, running about 2,000 cubic yards per day; while to run 40 yards

in the ordinary sluice costs from \$10 to \$12, an amount which will run 100 yards through the machine; moreover that, while the sluice will not save more than 60% to 70% of the gold under the most favorable conditions, and often not more than 10% or 20%, this machine practically saves it all; therefore, the rate of rent will not seem so extravagant. The cost of the machines complete, including engine, is about \$2,500. This invention will before long undoubtedly cause the development of large tracts of placer ground, where the necessary water for sluicing could be brought only at a tremendous expense.

## Technical Education of Miners.

It is unfortunate that more attention has not been paid in the United States to technical education for miners. England, France and Germany lead us in this respect, for in all those countries there are schools for miners which exist under Government patronage. The German schools is the best, and is world-renowned; its graduates holding responsible positions as superintendents of mines and metallurgical establishments all over the globe. Most of our prominent experts on this coast were educated in Freiberg, which shows that where there are so many good miners, their training must have been the best. Our Government, however, has not turned its attention in this direction at all, and beyond the Columbia School of Mines in New York, and such mining departments as exist in various colleges and universities, there are no mining schools in America, and there are none at all under the patronage of the Government.

Working miners, themselves, seem to care too little for their own good, for pursuing studies in connection with their own good, and such schools as are open to them are attended more by those intending to become professional men than by those who do the manual work in the mines. The Royal School of Mines, in London, has comparatively few of this class who avail themselves of the facilities offered for the acquirement of scientific knowledge. The lectures delivered there, however, are published in the papers and a great deal of useful knowledge is disseminated in this way. At that school the mode of instruction is by systematic courses of lectures, by written or oral examinations and by practical teaching in the laboratory and drawing office, and also, under certain conditions, by field excursions. The courses of instruction are distributed over three years, but those students who possess sufficient knowledge may, if they see proper, pass through the whole in two years. Those desirous of obtaining the distinction of Associates of the Royal School of Mines, who acquired a knowledge of the subjects of the first two years, may proceed at once to the courses of the third year by passing the final class examinations on those subjects before the professors, and paying a fee of £1 for each examination. The aggregate fees for the three years are £30, paid in advance or two annual payments of £20 each.

Still the really intelligent student can naturally reduce his expenses by working for exhibitions, prizes and scholarship, of which the school offers a large number. We glean some points on this subject from the *London Mining Journal* of recent date. It seems there are more Royal exhibitions to the Royal School of Mines, Jermyn-street, of the value of 50% per annum, entitling the holders to free admission to all the lectures and the chemical and metallurgical laboratories at the Royal School of Mines, to be held from year to year for three years, on the condition that the holder attends the courses regularly during those years, complies with all the rules laid down for his guidance, and passes the examinations required for the associateship of the school. There are two Royal scholarships of 15% each, which are given to the students who stand highest on the list of those who have passed their examinations for the first year, and a scholarship of 25% to that pupil who has gained the greatest number of marks in the examinations of the first two years. The Royal scholarships will be granted to those students only who have obtained first-class places in the examinations of their year, or in the examinations of at least two of the professors, in the case of such students as take the first two years in one. In addition to these there are the Edwards Forbes medal and a prize of books competed for annually, and to be awarded to the student who, having passed in the first class in the natural history examination, shall have obtained the greatest total number of marks in that examination, and in the examination in paleontology for the year; the De la Beche medal awarded annually to the student who, having passed the highest in the first class in mining, stands high in the examinations of any other branch of science taught in the school, a bronze medal and a prize of books, established in memory of the late director, Sir Henry De la Beche; and though last, not least, the Murchison medal and a prize of books, the gift of the late director, Sir Roderick Murchison, awarded annually to the student who stands highest in the geological examination, having passed in the first class in any one of the other subjects taught in the school.

The principal object of the Royal School of Mines, and that has certainly been fairly attained, has always been and is, to discipline the students of the school thoroughly in the principles of those sciences upon which the

operations of the miner and metallurgist depend. Of course, nothing but experience in the mine and in the laboratory can confer the skill and tact requisite for the practical conduct of those operations; but, on the other hand, it is only by an acquaintance with scientific principles that the beginner can profit by that experience and improve upon the processes of his predecessors. But while it has been the chief aim of the Royal School of Mines, to become to Britain what the Bergakademie of Freiberg and the Ecole des Mines, of Paris are to Germany and to France, the minister by whose instructions the British equivalent to these well known foreign institutions was founded, expressly stipulated that the professors should deliver annually, at a nominal admission fee, a course of lectures to working men. It appears to have been considered right that an institution subsidized by the nation should contribute to a certain extent to the great national object of educating those who are prevented by circumstances from educating themselves. These lectures were commenced in 1851, and the attendance upon them was so large, and the interest taken in this subjects discussed by the classes to whom they were addressed was so great that in the following year the officers of the School of Mines voluntarily determined to increase their labors in this direction, each professor engaging to give a course of six lectures in alternate years—and thus providing the working men with an average of 24, instead of six lectures in each year.

## No Delay in Patent Business.

As Mr. George H. Strong, of the firm of Dewey & Co., and especially engaged in the patent department of our establishment, has recently returned from a visit to the Eastern States, we requested him to prepare for us a brief statement of his observation at the Patent Office in Washington, with reference to the effect of the late fire on the transaction of business. Mr. Strong's personal observation, as will be seen by the note printed below, is that there is no delay or embarrassment whatever in the office at Washington. This fact will be of interest and importance to inventors who may be waiting for assurance of this kind before submitting their cases. Mr. Strong writes as follows:

**EDITORS PRESS:**—The fire at the Patent Office occurred during my visit to the Eastern States, and I purposely delayed visiting Washington for some time, fearing that affairs would be so deranged by the accident, that no business could be done for some time. When, after 10 days, I finally went to the Patent Office, I was surprised to find that business was moving on in its accustomed channel, with no appearance of any hindrance, and that there had been no interruption beyond the one day necessary to rearrange and clean up the various offices. Owing to the energetic action of the Commissioner of Patents and the able assistance of the force of examiners, clerks, etc., in the office, everything was restored to working condition in an exceedingly short time.

As has before been stated, the damage was confined mostly to the destruction of a vast number of old models which formed a part of the Patent Office museum; some of them being of course interesting because they showed the first steps and gradual development of industries which have since reached enormous proportions, but the model cases were altogether too crowded, and when the burned portion has been restored and a redistribution of the remaining models takes place, the general visitor will find very little to remind him of the loss. As the museum or model room was situated upon the third floor, which was of marble and fire proof, the fire was confined to this floor upon two sides of the hollow square occupied by the office, leaving the remaining two sides unharmed.

The business of the office is carried on upon the first and second floors, and the specifications and drawings being kept here, were unharmed, as were also most of the models in applications which were not finally disposed of, either by being allowed or rejected.

As the examinations are made by the aid of the specifications and drawings, it will be seen that the loss of the old models is of comparatively little moment. An effort will be made, however, to replace some of the models, and the Office issues a circular to each inventor whose model has been destroyed, stating that such model may be replaced if made to correspond with the specification and drawings, but the replacement of the model is optional with the inventor.

Our clients need have no fear that their business will not receive the prompt attention heretofore given to it. The firm of Dewey & Co. have the reputation in the Patent Office of being conscientious and careful of the interests of their clients, and my recent visit to Washington has resulted in arrangements by which our business will be even better managed than heretofore.

Geo. H. Strong.

202 Sansome street, S. F., November 8th.

**THE Edinburgh Scotsman's** London correspondent says: "In political circles there is great expectation that Earl Beaconsfield will shortly make a speech on the Eastern question which will provoke the renewal of last year's excitement and agitation. It is reported that he will put his foot down on the question of opening the Dardanelles to Russian and other war vessels."

Continued from page 297.

**Smartville.** The total capacity of all the ditches is 5,000 Smartville miner's inches, and the whole investment in this class of property in this locality approximates \$1,200,000. The Spring Valley and Cherokee ditch is 32 miles long, and has 3 1/2 miles of iron pipe, 30 inches in diameter. The size of the ditch averages 5 feet wide, 3 1/2 feet deep, discharging about 2,000 inches of water.

The Hendricks ditch in Butte county, is 4 1/2 miles long. Grade of the upper line of ditch, 12.8 feet per mile. Grade of the lower line, 6.4 per mile. Respective sizes, 5 feet wide, 2 feet deep. Total cost, including the Beatson ditch and Oregon Gulch ditch, \$136,150.

The La Grange ditch, including the Patrikville branch, is over 20 miles in length. Size, 9 feet on top, 6 feet bottom, 4 feet deep. Grade from 7 to 8 feet to the mile. The greater part of the ditch is cut in granite, and in places there are solid walls 50 to 70 feet high, built of stone. It discharges 3,000 miner's inches of water, and its cost to date is about \$450,000.

General Observations.

Ditches in California with carrying capacities as large as 80 cubic feet per second have been built, and are now in successful operation, with grades of from 16 to 20 feet per mile. In a mountainous country where steep grades can be generally obtained by a slight increase in the length of the canal, and where the cost of excavation is large, a great saving can be effected by using the smallest sized canals and aqueducts practicable to carry the given quantity of water, or, in other words, by running water rapidly through a small channel rather than slowly through a large one. It is found to be safer and more economical, on account of the deep snows and terrific storms which rage in the mountains during the winter, to run and maintain in repair narrow and deep ditches on heavy grades than broad ones with light grades. The experience of ditch builders in this State has been highly favorable to these steep grades, but little trouble being caused by the washing of the banks due to high velocities. In the valleys with ash soil such grades, of course, would not be practicable.

See Raymond's Report 1873, pp. 73, 74. The original ditch, about 10 miles long, is said to have cost \$375,000. Since its completion the Patrikville ditch and reservoir have been built at a cost of \$75,000.

These narrow ditches with steep grades do not discharge within from 25 to 30 per cent. of the amount of water given by the formulae for "the discharge of water in canals."

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

**WEIGHING SCOOP.**—Michael L. Mery, Chico, Butte Co. This is a novel combination scoop and weighing device, and consists in constructing a scoop in combination with a spring balance, located in the handle, with scale and pointers on the handle, and a stop so arranged as to save the spiral balance spring from damage when the scoop is thrust into any hard unyielding material. The invention also relates to certain anti-frictional devices and a balance adjustment. The combination of handle and stem is made stiff and unyielding by reason of the stop. When the material to be weighed is raised up in the scoop the stop is released and the balance being free to act, the weight of the material will show on the scale. This arrangement of scoop and scale gives two useful articles in one, and is very serviceable where a large amount of material has to be divided by weight into small quantities.

**CHEESE PRESS.**—Wm. H. Ahrens, San Luis Obispo. The patent covers certain improvements in presses, more particularly applicable to cheese presses. It consists of a frame within which the board or platen moves up and down, carrying with it the cheese or article to be pressed. The platen frame is suspended from a lever which has its outer end fixed, and from its inner end a bar extends down so as to rest upon the pressing board, so that the weight of the article to be pressed and the movable frame serves to do the pressing without additional weights. The moving parts are elevated at will by a drum and crank.

**DEVICE FOR RELEASING ANIMALS FROM STALLS.**—Samuel B. Martin, S. F. This invention relates to a novel means of releasing animals from their stalls or fastenings, either singly, for the purpose of removing them for ordinary use, or, in case of a fire or other emergency, to free all the animals at once by a single operation. It consists in the use of a stationary socketed plate, which is secured to the side of the stall, and a sliding bolt, which crosses the socket, and which is provided with a local means for the operation of each one singly, and a general connection whereby all of the fastenings may be operated at once.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

Week Ending October 25th, 1874.

MOLD FOR MAKING PIPE FROM MORTAR.—Ezra M. Hamilton, Los Angeles, Cal.  
LATHS FOR VEHICLE SEATS.—J. J. Newcomb, S. F.  
MACHINE FOR MAKING BARREL HEADS.—David Pomeroy, S. F.  
BREACH-LOADING FIRE-ARMS.—Henry Sulter, Baker City, Oregon.  
TRANSMITTING TIME MOVEMENT TO DISTANT PLACES.—Hermann J. Wenzel, S. F.  
BEERY BOXES.—Chas. W. Weston, S. F.  
STARCH FOR FOOD.—Krygers, Rasmussen & Co., Gold Run, Cal.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.  
NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

THE principal portion of the town of Cuffey's Cove, Mendocino county, was destroyed by fire on Tuesday night.

Gov. IRWIN has commissioned Dr. W. G. Wayman, of this city, a member of the State Board of Health, vice Dr. Herz, who has left the State.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies, Oregon and Nevada, in this paper, as the cheapest appropriate medium for the same.

California and Oregon Land Company.

Location of principal place of business, San Francisco, California. Location of works, Jackson County, Oregon. Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of October, 1877, an assessment, No. 1, of thirty-five cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 418 California Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the twenty-eighth day of November, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Monday, the twenty-fourth day of December, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.  
J. W. CLARK, Secretary.  
Office, 418 California Street, San Francisco, California.

Excelsior Silver Mining Company.—Prin-

cipal place of business, San Francisco, Cal. Location of works, Potosi District, Lincoln County, Nevada. Notice is hereby given that at a meeting of the Board of Directors, held on the second day of November, 1877, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold and silver coin, to the Secretary, at the office of the Company, 312 Post Street, San Francisco, Cal. Any stock upon which this assessment shall remain unpaid on the third day of December, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Monday, the twentieth day of December, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.  
W. A. KOLLMYER, Sec'y.  
Office, 312 Post Street, San Francisco, Cal.

Fresno Quicksilver Mining Company.—

Location of principal place of business, San Francisco, Cal. Location of works, Mexico, Fresno county, Cal. ## Iron and Machine Works.

**PACIFIC ROLLING MILL CO.,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Con-  
necting Rods, Car and Locomotive  
Axles and Frames,

—ALSO—  
Hammered Iron of Every Description and Size.  
Orders addressed to PACIFIC ROLLING MILL  
COMPANY, P. O. Box 2032, San Francisco, Cal., will re-  
ceive prompt attention. Office: 16 First Street.  
The highest price paid for Scrap Iron.

THOS. PENDERGAST.

HENRY S. SMITH

**ÆTNA IRON WORKS,**

MANUFACTURERS OF

**IRON CASTINGS**

and **MACHINERY**

OF ALL KINDS.

mont Street, Bet. Howard and Folsom

SAN FRANCISCO.

**SHEET IRON PIPE.**

**Risdon Iron and Locomotive Works**

Corner Howard and Beale Streets,

Are prepared to make **SHEET IRON AND ASPHALTUM  
PIPE**, of any size and for any pressure, and contract to  
lay the same where wanted, guaranteeing a perfect work-  
ing pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special pat-  
terns for Mining Cars. These small wheels are made of  
the best Car Wheel Iron, properly chilled, and can be  
fitted up with the improved axle and box—introduced by  
this company, and guaranteed to outlast any other wheels  
made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

**PHELPS  
MANUFACTURING COMPANY.**

Manufacturers of all kinds of  
Wharf and Bridge Bolts, Railroad Trestle  
Work, Car Frames and Bolts, Machine  
Bolts, Set Screws and Tap Bolts,  
Lag or Coach Screws.

**ALL STYLES OF FANCY HEAD BOLTS.**  
HOT AND COLD PRESSED HEXAGONAL AND  
SQUARE NUTS, WASHERS, BOLT ENDS,  
TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

**SACRAMENTO BOILER WORKS,**

37 Fremont St., cor. Mission, S. F.

**HALL & KELSHAW,**

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks,  
Hydraulic Pipe, Oil or Water Tanks, Ore and  
Water Buckets, Gasometers, Girders, Bridges  
and Iron Ship Building.

**ALL KINDS OF SHEET IRON WORK.**  
Repairing promptly attended to at the  
lowest possible terms.

**GOLDEN STATE & MINERS' IRON WORKS.**

Manufacture Iron Castings and Machinery  
of all kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board **AMALGAMATORS,**  
Golden State Pressure Blowers.

First St., between Howard & Folsom, S. F.

**CALIFORNIA BRASS FOUNDRY,**

No. 125 First Street, Opposite Minna  
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt

San Francisco.

Patented May 12, 1873.

USE NO OTHER, AND INQUIRE FOR THESE  
GOODS ONLY.

These goods are specially  
adapted for the use of  
FARMERS, MECHANICS,  
MINERS, and WORKING  
MEN in general. They  
are manufactured of the  
Best Material, and in a  
Superior Manner. A trial  
will convince everybody of  
this fact.

**HUNT, DOUGLAS & STEWART Process,**

Used in Connection With PURVINE

Wooden Amalgamating Pans and Settler.

This is a complete, perfect and economical adaptation  
of the humid method to the treatment of Gold or Silver  
ores, associated with

**COPPER**

And other base metals, or to ores free from base metals.  
It can be adapted to any first-class Gold or Silver mill, at a  
reasonable additional expense.

For further information, address

J. O. STEWART,  
Georgetown, Colorado.

## Machinery.

**SNYDER'S  
LITTLE GIANT STEAM ENGINE.**

For Farmers, Machinists, Printers and all requiring  
light power. Sizes from one to six horse-power. Prices  
for engine and boiler complete, from \$150 to \$450. We  
make the strongest boiler and the best engine in the  
country. Call at our factory or send for free illustrated  
and descriptive catalogue.

SNYDER BROS., 94 Fulton Street, N. Y.

**The Ingersoll Rock Drill**

Mines Using these Drills on the Comstock  
Lode—Virginia City, Nevada:

Com. Virginia M. Co.,	Best & Belcher M. Co.,
California M. Co.,	Crown Point M. Co.,
C & O Shaft,	Belcher M. Co.,
Utah M. Co.,	Yellow Jacket M. Co.,
Ophir M. Co.,	Sierra Nevada M. Co.,
Mexican M. Co.,	Prospect M. Co.,

Gould & Curry M. Co.,	Sutro Tunnel Co.,

J. B. REYNOLDS,  
320 Sansome Street.

**THE O'HARRA  
CHLORIDIZING FURNACE**

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man .....	\$ 4 00
One mail .....	3 00
Wood—23 Cords at \$3 per cord .....	5 25
Salt—1,600 lbs at 2 1/2 cents .....	40 00

Cost of 20 tons .....	\$52 25
Cost of one ton .....	2 61 1/2

In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines in Fresno District, Nev., and at  
the Exchequer mill, Alpine Co., Cal. For further infor-  
mation, apply to

D. J. O'HARRA,  
Reno, Nevada.

For their Improved  
TURBINE WATER WHEELS**

# TULLOCH'S AUTOMATIC ORE FEEDER, \$1,000 Challenge Ore Feeder.

Awarded the Centennial Medal.

Refer to the Following Named Mills:

## SILVER MILLS.

Con. Virginia; California; Trench; Douglas; Northern Belle; Leopard; Humboldt; Eagle; Columbus; Central America; Guyamas; Martin White; Tasso; Rye Patch; Everett; Heberlein & Co.; Manhattan; Duncan, L. S.; Phenix Copper, L. S.; Barranico; Emigrant; Sunrise; Maumee.

## GOLD MILLS.

Gold Mountain, Amador; Gold Mountain, San Bernardino; Buchanan; Green Mountain; Santa Rita; Riverside; Shawmut; Knox & Boyd; Spring Gulch; Magruder; Douglas; Hite; Phenix; Amador; Bandereta; Church Union; Mount Tomales; Crescent; Tiffany & Hepburn; Gold Stripe; Thomas Evans; Republic; Omaha; Sumner Mill.

**FRED'K OGDEN, Sole Owner Tulloch Patent,**  
ROOM 72, NEVADA BLOCK.

Extract from a letter from C. G. Rodgers, Superintendent Green Mountain Mining Co., Plumas County, September 10th, 1877: After using both the Tulloch and Hendy Ore Feeders, side by side, for eight months, I can candidly say, that in my opinion, the Tulloch is much the best machine; it will feed any ore that can be fed by machinery; there is nothing about it to wear out, and should anything break, any blacksmith can repair it. Whereas, the Hendy machine is wearing from the moment it is started, and when any thing is worn out, or broken, you must have a machine shop or foundry to make the repairs. The Hendy Feeders are not in use at the Gold Stripe Mill; they were thrown out after a fair trial of some two weeks.

## REGISTER YOUR

TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

## HENDY'S \$1,000 CHALLENGE ORE FEEDER.

I call my Automatic Ore Feeder the \$1,000 Challenge, because I challenge the owners or backers of any other feeder to a competitive test for that amount. As Mr. C. G. Rodgers, Superintendent of the Green Mountain mine, near Greenville, Plumas county, appears prominently as a detractor of the merits of my feeder, and seems confident that another one is better, perhaps he will accept this long-standing challenge which the owners of other patents will not, and give me an opportunity to prove publicly the superiority of my machine. As to Mr. Rodgers' assertion about my feeder wearing out, it is no less fallible in that respect than other machinery; but I have over 250 now in use, some of them for over two years, and have never had to expend 25 cents for repairs. The fact that my feeder received the premium at the late Mechanics' fair, and that I am shipping several feeders weekly to different parts of the country, is sufficient proof of the appreciation in which it is held.

As to my feeders having been thrown out of the Gold Stripe mill, they were not displaced for inefficiency, as the following letter will show, and it answers also as a complete refutation of Mr. Rodgers' statement:

OFFICE SUPERINTENDENT OF THE GOLD STRIPE G. M. CO., )

JOSHUA HENDY, Esq.—Dear Sir:—Your favor of the 15th instant at hand. In reply to your inquiry as to the working of your ore feeders at our mill, we can say that there is no fault in the machines, and we consider them the best now in use. At present they are not in use with us, owing to the construction of the mill, which we are about to rebuild and make proper arrangements for putting in your feeders.

J. K. OWEN,  
Superintendent Gold Stripe Mine.

One of the principal owners of the Gold Stripe and Green Mountain mills is also largely interested in the Plumas National mine, where I have just shipped several feeders, showing the confidence placed in the machine by these gentlemen who have used it.

Now, if Mr. Rodgers is sincere in his belief as to the merits of a rival machine over mine, here is a chance for him to make a thousand dollars easily, if he can get the owners of the machine to lend him one for the trial, which is the only doubtful thing in connection with the matter. Mr. Rodgers' eight months' experience with both machines ought to give him confidence enough in his own convictions to accept the challenge offered to him, or any one else.

JOSHUA HENDY.

Corner Fremont and Market Streets, San Francisco.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the *carrier*, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply *dropped*. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other the market, and will sell them as cheap as any other of its class.

## ARITHMETIC MADE EASY. ROPP'S EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months.

The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Granaries, Bins, Wagon Beds, Corn Cribbs; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mechanical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided.

The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00.  
Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter or receipted by express. Address

DEWEY & CO., San Francisco.

SANTA CLARA, CAL., April 6th, 1875.

Messrs. DEWEY & Co.—Gents:—We have just received Patent No. 160,535, for J. T. Watkins & Co.'s Mammoth Road Grader, which was patented through your Agency. It is the neatest and best that we have ever received. We feel proud of it and thankful to you for the care and attention that you have given it, and when we have anything to do in that line of business, we will surely give you a call. Very respectfully,  
J. T. WATKINS & CO

SCIENTIFIC PRESS.—As the old year is drawing to a close and the new is rapidly approaching, all our mining friends should subscribe for this scientific journal, especially devoted to their interests. It is a California enterprise, and compares favorably with similar organs of years more experience and age in the old countries.—*Golfax Enterprise.*

## Patent Foot-Power Machinery.

A few years ago comparatively little attention was given to foot-power machinery. Its utility was supposed to be limited to the narrow capacity of the old crank and treadle motion, which had followed down unchanged from the time of the ancient Egyptians. Good mechanics, being well aware of the defects of this old motion in driving machinery, knew that they could not accomplish anything in actual business to pay for the expense of such machines. Some six years ago radically new inventions were offered to those having use for foot-power machinery, and the new foot-powers without dead centers were made successful in actual business. The Barnes foot-power machines made a radical revolution in foot-power machinery. The machines have been thoroughly tested in workshop business, and meet the long felt want of practical foot-power machinery without dead centers, with a positive motion always in the right direction, and with the largest economy of power. In these machines the pressure of the foot can never retard the motion already gained, but, on the contrary, sends more power from the treadle to the work than is possible in any old-fashioned machine. They have no dead centers to pass, and therefore no necessity to press the treadle at exactly the right point, and raise the foot at exactly the right moment. In all the old-style machines the operator must do this or else retard the motion, and often cause it to stop by a wrong pressure. With these patent foot-power combinations, any pressure of the foot upon the treadle, wherever made, always develops a machine motion in the right direction, and always adds to the working power. This great advantage all good mechanics can appreciate. The stroke of the treadle can be made fast or slow. The difficulty resulting from the old motion, with its dead centers, necessitated a heavy balance wheel to carry the motion through the time when the foot could not be pressed down without deranging the action. This difficulty does not exist at all in these machines, so no heavy balance wheel is needed to meet it.

The patent foot-power combination referred to is herewith illustrated in Fig. 1, the parts being shown detached. The wheel A is the only continuously revolving wheel. The wheel B oscillates about once around, and is termed a take-up wheel. C is an oscillating thimble with two straps, which wind on and off by the action of the treadle, and a spring (composed of an upright piece of wood attached to the leg of the machine), and wheel B. E is termed a dog, and connects motion from the thimble C to the wheel A. The thimble C is caused to oscillate by the two straps winding on and off. One is attached to the treadle and the other to the wheel B. The wheel B is acted upon by the wooden spring referred to, which rewinds it, and thus causes the treadle strap to rewind upon the thimble C. The thimble C carries the dog E back and forth, which engages in the wheel A in its forward motion, and, without checking its speed, runs back idle for a fresh hold. By this simple arrangement, and by the effort of an ordinary walk, the wheel A can be driven at the rate of from 800 to 1,200 revolutions per minute. On scroll saws only one continuously revolving wheel, A, is used. For lathes a cone of pulleys is arranged in this wheel and held to a corresponding one on the lathe spindle. The smallest pulley of these cones is three, and the largest eight inches.

Fig. 2 shows this device applied to a scroll saw. The ordinary motion of this machine is from 800 to 1,200 strokes per minute. The motion is obtained by a very plain device, only one continuously revolving wheel being used, to which the arms are attached. The stroke of the pedal can be made long or short, to suit the operator, for high or low speed. The saw leaves the work as smooth as possible. The swing around the blade, under the arm, is 24 inches; blade, seven inches long. The table is made of white ash, arms of hard maple and the frame of cast iron, weighing in all 55 pounds. The revolving wheel runs on a steel arbor. This machine is sold in this city for \$25.

Fig. 3 is a combined scroll and circular saw

and boring machine. Each machine is perfect, neither being subordinated to the other. The owner can put three machines in one, ready for work in either way, in one minute, and each will do its proper work. The foot-pad is adjustable the whole length of the rod to suit any variety of work. The circular saw, while remaining on its maudrel, can be taken at once out of the way when the scroll saw or boring attachment is to be used. The table to the right of saw is mounted on true planed iron ways. On this table the material is placed at any desired angle and moved to the saw with perfect accuracy. The table is adjusted up or down by a screw, to allow any desired depth of cut being made by the saws or cutter tools. This machine is sold for \$40.

Fig. 4 is a lathe with the patent foot-power attachment. The swing of this lathe is nine and three quarter inches, and will take work 30 inches long. No wrench is required to

FIG. 2. FOOT-POWER JIG SAW.

adjust the tail stock or other parts, hand wheels being used instead. The speed can be varied from one revolution to 3,000 per minute at will. It is not necessary to pull the belt to start it in the right direction, for when the treadle is moved it goes at once in the proper way. This arrangement does away with the usual cumbersome frame-work for a treadle, nor does the treadle jar the machine. The lathe-bed is of wood and can be made any length. All the bearings are of steel. The centers are fitted to taper holes. There are three cone pulleys on the machine. The price is \$35.

This machinery can all be seen at the store of Oshorn & Alexander, 628 Market street, in this city, they being agents for this coast. They

Fig. 1. Patent Foot-Power Combination.

have a great variety of lathes and saws of different styles, run by this same foot-power attachment, and also a large and varied assortment of mechanics' tools of every possible kind.

These machines have proved so successful that the agents are willing to send them on trial and will take them back if not found satisfactory.

MINE PATENTS.—Dewey & Co., of this city, have recently added another important branch to their already extensive mining business, viz: the procuring of patents for mine and mill claims. This firm has facilities for procuring patents that will insure promptness and accuracy, which will be appreciated by Sierra mine owners, many of whom have been sorely annoyed by needless delays in procuring patents. —S. F. Correspondence Mountain Messenger.

## The Mechanic Arts College.

We see that the Regents of the University of California have adopted a plan for the new edifice for the Mechanic Arts College, at Berkeley. Bids will be immediately advertised for, and the contract for the construction of the building will be let and the work prosecuted at an early day. The plan includes a substantial structure of brick and stone, with massive walls, to stand the weight, wear and tear of machinery. The cost of the edifice must come within the appropriation of \$40,000.

It is to be hoped, after this new building is completed, that the Legislature will appropriate sufficient funds to equip it in a manner commensurate with its need. Simply a Mechanic Arts College building amounts to little unless properly equipped. The machinery, tools, etc., requisite will, in all probability, cost considerable

FIG. 3. COMBINED MACHINES.

more than the building; that is if the College has an equipment such as is hoped for. The people of the State must be prepared, however, to spend some money in properly establishing this College if it is to be of any practical utility.

During the past year the University has overflowed with students, but the appropriations have been meager, and business has been conducted on an extremely economical basis. An institution of this character, with a large corps of instructors, is an expensive one to run, but

Fig. 4. Foot-Power Lathe.

it is of inestimable advantage to the State. Limited means cause many drawbacks, and increase the labors of the teachers. Many things are required from time to time, which should be purchased, but have to be dispensed with. The Legislature should take into account the importance of the institution, and help it as much as possible.

When the Mechanic Arts College is in full swing there will be no better place in the country to acquire an industrial education; for taken in connection with the Agricultural College, the University of California will offer every encouragement possible in this line. As we stated before, it is to be hoped that the Legislature will deal liberally, not only with the University, but the new College in particular, so that every facility will be supplied to aid the instructors in their several departments.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

BERRY BOXES.—Chas. W. Weston, S. F. This invention relates to that class of berry boxes in which the boxes are constructed by crossing two or more thin shavings or veneers at right angles to each other and bending their ends upwards and then securing the edges by a sheet metal or other binding. For convenience in transporting the empty boxes it is necessary to make their upper open ends wider than the bottoms, and this is done by flaring the sides outward toward the top of the box, so that any number of the boxes can be nested together. The strips of veneers heretofore used were made with straight edges, so that when the upturned sides were flared, an opening gradually increasing in width from the bottom to the top of the box was formed in each corner. This opening is by some considered objectionable, because the small fruit or berries which were placed in the boxes would get into these openings and get jammed, and the juice would run out over the box and soil the clothes of the person who carried it; moreover, it spoiled the appearance of the fruit. To obviate this trouble this inventor cuts the edges of the top in a peculiar manner. He also provides an improvement in the binding, whereby he is enabled to make larger boxes of this construction, whereas they have heretofore only been made for small fruit on account of the difficulty of making them strong and rigid enough.

"LAZY-BACK" FOR VEHICLES.—John J. New-some, S. F. This is an improved arrangement for attaining a yielding or elastic motion for the lazy-back of a carriage or other vehicle seat. Ordinarily the back is rigidly secured to the back proper of the seat by standards, and the elbows are similarly attached. This invention consists in supporting the rail or lazy-back upon hinged standards and then connecting the elbow at each end to the standard, so as to allow the loose or free motion, while the front end of each arm is mounted on a coiled spring which admits of free action when a strain comes on the back.

HEADING MILL.—David Pomeroy, S. F. The invention relates to improvements in heading mills, and consists in a novel arrangement for feeding the saw table in such a manner that the approach to the saw is slow, to allow the cutting of the timber, while the downward, or withdrawing motion, is made rapidly, thus increasing the capacity of the mill and causing a saving in the labor employed. It also consists in the use of adjustable jaws attached to the saw table for holding the stick of timber to be sawed, which do away with the necessity of using dogs to hold the holt, and allow a rapid feed with little labor.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Con. Virginia, Nov. 10th, \$238,944.79; Standard, 6th, \$46,291.11; Northern Belle, 5th, \$5,524.85; Arizona, 7th, \$1,335.38; Endowment, 10th, \$2,656.72; Grand Prize, 9th, \$12,500; Leopard, 10th, \$4,700; Modock, 9th, \$5,945.27; California, 10th, \$141,706.97; Northern Belle, 7th, \$5,884.78; Alps, 10th, \$1,800; Raymond & Ely, 7th, \$14,288.48; Northern Belle, 10th, \$7,109.50; Modock, 11th, \$3,411.37; Tyho, 10th, \$8,426.75—total to date, \$27,472.25; Grand Prize, 15th, \$14,700; California, 13th, \$161,508.57; Con. Virginia, 13th, \$59,575.07; Martu White, 10th, \$11,964.97; Arizona, Oct. 30th, \$1,547.23.

GOOD RUNS.—The Sentinel says that one of the Eureka Consolidated furnaces has run uninterruptedly for over 130 days, and two others 100 days, not an hour having been lost during that time, outside of the necessary stoppages. An effort will be made to keep all four in operation during the present month, and relieve them, one at a time, in the month of December. Nos. 1, 2, and 4, will be shut down, each furnace taking about seven days to repair, and in consequence, an average of but three furnaces will be in operation the ensuing month.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### The Silver King Mine.

EDITORS PRESS:—In coming from San Francisco to Globe district, Arizona, I laid over a few days at Pioneer district, 35 miles nearer Florence, mainly with the view of taking a general external look at the above named well-known mine. I say "external," for no man, friend or foe to the company, is allowed to examine its internal workings. What the object of this mysterious procedure can be, and what evidences of sagacity may be drawn from the fact that the owners will not permit a visitor, as I was given to understand, even to set his foot on the ore dump, I am unable to say. My memory it may be added however, carries me back to a time in a certain mining district in Nevada, where a man who owned a rich mine took great pains to show it to all comers, but when it unfortunately became barren, he promptly found satisfactory excuses for excluding visitors, and actually succeeded in creating a mystery out of a common-place occurrence. While one's suspicions are naturally excited in regard to the condition of the Silver King mine, I must admit that in the conflicting testimony I was able to gather in respect to it, there is a preponderance favorable to the property, in estimating its present and future value. I was informed by men who worked at the bottom when the last work was done, that there were large bodies of high-grade ore in sight, very little of which was allowed to come to the surface. On the opposite side, men generally well informed, who had been in the district or who had lived in the vicinity of the mine for months, assured me, with equal confidence, that the ore deposit was completely exhausted. This conflict in testimony is the first fruits of the secret policy adopted by the owners, and if they are pleased at this state of things, if they believe they can possess a rich mine and gain benefits from it without the public becoming aware of the fact, or if they imagine they can sell the property to men who are not allowed to look at it, I confess I do not see any reason why they should be taught any sooner than experience will teach them, that there is a practical limit to all such fine little plans.

There has been a difference of opinion expressed, also, in regard to the nature of the rock in which the King mine is found. One gentleman I heard expatiating in San Francisco some months ago, declared that its country-rock was sandstone, just such as grindstones were made of, and that the ore was in an egg-shaped mass, without any evidence whatever of a vein-formation. I saw no sandstone near the mine, and I found on the surface a continuous vein of ore-bearing rock for several hundred feet, about as regular and well defined as lode-croppings are usually expected to be. I do not undertake to describe technically the yellowish colored and rather uncommon rock adjoining the ledge, but may say that there is a formation seen at one point on the eastern side of the Comstock lode, which scientists call porphyry, that unmistakably resembles it. A Comstock miner, looking at the white rock on the Silver King dump, will almost think himself in Virginia City, and until he goes off some distance to the north or south, where shafts are being sunk in harder granite material, he will find nothing that will take the "grindstone" shape.

There have been numerous opinions given, also, in reference to the Silver King mine being a "slide" or a "faulted" body of rock which had come from higher ground, and in respect to its being laid out by the locators as an east and west lode when its true course was really north and south. So far as a careful examination of the surface enabled me to judge, I could see no evidence of such "faulting" as would swing the ledge completely out of its place. The vein is regular, with a southwest and northeast strike, its dip being to the northwest. The locators may not have laid down their surface lines exactly parallel to the trend of the vein, but they are so near the true line that it will be a very extraordinary thing in the future if the Silver King, north, captures a single foot of the original claim, or if the Silver King, south, secures more than a diagonal slice at a considerable distance from its present shaft. As the two extensions named have cost round sums of money, and, withal, are \$10,000,000 California incorporations, it may not please some parties to see this opinion expressed in print, but the truth ought to be told whatever the result may be.

There are two belts of silver-bearing veins in Pioneer district, the one running into the other at no great distance from the Silver King. The latter mine, and the "petered" out Athens claim, as well as others, run northeast and southwest, while the Guanavato, a rich lode recently discovered by the Connolly brothers, is in a belt running south southwest and north northeast, and inclining to the east. The evidences of deep fissuring are very plain in the latter belt, and several very promising mines are found along its course.

If the Silver King mine is only a slide, it must

have come from this belt, which strikes along the western slope of the range several hundred feet above its works. A break from a lode dipping to the east would not be found pitching to the northwest after being thrown at least 100 or 200 feet, without presenting on the surface a loose and shattered appearance, such as is not seen on the King croppings. I do not think that the lode is much out of its place, or that it will be found running north and south with a western inclination, when it would have to belong to a belt all of the ledges in which, even on the surface and parallel to the King shaft, are found dipping to the east.

I see no reason why the mine should cease to be productive. It has yielded in high-grade ores several hundred thousand dollars, and will, I have no doubt, if properly managed, continue to enrich its owners for years to come. In the past it has been very badly managed. Its ores, assaying thousands of dollars to the ton, were thrown into the waste dump, so that after an immense amount of assortment and re-assortment, now going on as has been the case for months past, as much money will be obtained by this means as was originally taken out of the vein when the ore was separated from the waste before being brought to the surface. One man who paid \$15,000 for the right to pick over the dump made \$75,000 out of it, and then sold his right to another, who it is believed will realize about an equal sum. The company is also concentrating the rock rejected by the sorters, and making a handsome profit by the operation.

I had not an opportunity of visiting all the mines of the district, but I saw enough to convince me that, by the effective application of capital, there is a prosperous future for it, and liberal returns to those who skillfully engage in developing its resources.

J. D. E.

Globe City, A. T., Oct. 25th, 1877.

### Forest Hill Mining Items.

The Placer Herald says: The activity displayed by the miners of this section in thoroughly and extensively fitting up their claims in anticipation of a bounteous water season has given quite a stimulus to the town of Forest Hill. Improving and repairing has been the order for some time. A vacant house is not to be found in that town, and business of all kinds is fairly prosperous. The Dardanelles Consolidated company, whose property comprises what was formerly known as the Oro and Dardanelles claims and ditch property, under the superintendency of Mr. Joseph McGilvray, have had a large force of men employed all summer and fall, and have effected some extensive and important improvements. They have cleaned out and enlarged their ditch from head to foot, a work which will materially increase the water supply of that part of the divide. They are now at work on the claim running drifts and fitting up generally for the washing season. In place of the one pipe that heretofore carried water down into the claim, they are preparing to put down two pipes, each 22 inches in diameter. These will carry a large amount of water and will enable them to tear away the bank at an astonishingly fast rate. The gravel in this company's claim is known to be rich, and with their increased facilities for washing it, we may expect to hear of big returns from this source as soon as the water season commences.

Willis Jones is fitting up the Green Spring claim, which adjoins the Dardanelles Consolidated on the east, and intends to work it this winter.

West of the Dardanelles Consolidated, lies the Big Spring claim, owned by May, Pecht & Neuman. This is thought by some to be one of the best hydraulic claims for its size on the ridge. The owners have been drifting this past summer and have made it pay. They propose, however, to wash during the water season, and with this view have put in new pipe and otherwise fitted up their claim in excellent shape.

The Jersey, which lies just under the hill from town, owned by Howell & Co., is a drift claim, and has been operated steadily all summer, yielding, we understand, very fair returns.

At the Young America, owned by Harris & Co., they are at present employing 20 odd men in fitting up and prospecting their claim. Their washing thus far has been, so to speak, on top, and yet it has paid well. There is no telling how rich their ground may be on the bottom, but for the purpose of prospecting it they are now sinking a shaft down to the bedrock.

The Adams brothers have recently bought out Mr. Beswick, out near Brushy. They are fitting up their claim for hydraulicing, and if water should prove plenty this coming winter they will work it by that method. But in the event of water being scarce, as was the case last winter, they will work the claim on the drift plan. The gravel is rich and will pay by either process.

Cranage & Co., at Smith's point, profiting by the experience afforded by last winter, which was a dry one, are also prepared for either hydraulicing or drifting, and like the Adams brothers, will do the one or the other, according as the winter shall be wet or dry.

Mr. Arthur, whose claim is also near Smith's point, discouraged by losing last season's time, owing to the lack of water, commenced to drift last summer and has made it pay. He has taken no pains to fit up for hydraulicing, determined to keep on drifting until assured of plenty of water.

The Sebastopol, owned by Fox & Co., is a cement drift claim, the material from which has to be put through a mill process in order to give up its gold. For want of water they have been

able to run the mill only a few hours a day recently, but when the rainy season fairly sets in and water becomes plenty, they will run steadily and make it pay.

Wm. Borland, near Smith's point, continues steadily at work in his drift claim. He is now in over 1,000 feet. His gravel is good and growing better. His prospects are such as to indicate that he is opening up one of the best claims on the divide.

Breece & Wheeler have their celebrated hydraulic claim at Bath all fixed up in good shape, ready to commence washing as soon as the water supply is sufficient. We might mention, right here also, that Mr. Breece has just completed one of the finest dwelling houses in the mountains, at a cost, it is supposed, of but little less than \$10,000.

Grinnell & Ford have been opening up a new claim in Lady's canyon, and are ready to commence operations whenever the water comes. They have a location that promises to prove rich.

Burt & Dewey are taking good paying ore from their quartz mine at Bath, and keep their mill running nearly all the time.

Hosmer & Co. have their tailing claim in Volcano canyon ready for the winter's run. This claim consists of a bed of gravel some 30 or 40 feet deep that has collected mainly from the rich mines above it, and is quite rich.

Wm. Lee, whose claim is in Volcano canyon just below Hosmer & Co.'s, is of a similar character, and pays well. Mr. Lee has been sluicing pretty much all summer, utilizing the water that flows down the canyon, and has made it pay. He is now making preparation for more extensive operations this winter.

From the foregoing it will be seen there is much vitality yet in the mining interests of Forest Hill and vicinity. The preparations for the winter's work are indeed more extensive and thorough than for years before, and a fact that indicates a recuperation of our mining interests, the result of increasing confidence in the richness of Placer county's gravel deposits.

### Prescott and Vicinity.

There are fewer idlo men in Prescott than in any town on the coast. The demand for labor to develop the newly discovered bonanzas, and the increased forces put to work on the older mines, have taken almost all the floating population. The erection of new quartz mills in every section of the county has given an additional impetus to prospecting, and the extent of country being explored is wonderful. The number of claims recorded will average about 20 per week. All the mining camps are filling up, and our merchants are seizing the opportunity to establish branch stores at the different towns, thus showing that they too have faith in the future prosperity of the country.

The Humboldt district is panning out well. The Tip-top and other mines are yielding larger quantities and richer ore than ever. As soon as the new mill is completed and in running order, this district will turn out an amount of bullion that will belie its name.

Peck district still holds up to its former standard, although the Tip-top excitement withdrew the attention of the public for a short time, but the near completion of the new 20-stamp mill for the Peck mine, and the fact that the company ship at least \$3,500 worth of bullion every other day, assures us that the owners have the bonanza of the district. The Black Warrior, also in this district, is showing up unusually well, and the company is taking out a quantity of very rich ore. Some specimens in town the other day show rich in native silver.

In Turkey Creek district everything is rushing. Masterson's mill will soon be ready, and will make its first run on 50 tons of Goodwin ore. The Black Warrior company have contracted with Mr. Masterson to have 40 tons of ore from their mine worked after the first clean-up. The Turkey Creekers now have as complete a silver mill as there is in the Territory, and are not going to be slow to take advantage of it. Great activity is displayed at all the mines and a very large amount of rich ore is being taken out.

Already the effect of this activity is being felt throughout the county, and is drawing the attention of California and Eastern capitalists this way. New companies are being organized in San Francisco, almost every week, to work some of the numerous rich mines in this Territory, and the day is fast approaching when Arizona will rank foremost among the "Silver States."—*Arizona Miner*.

PERSONAL.—We are grieved to learn of the death of William Henrici, at his home in Pennsylvania. Not long since we took leave of him and bade him God speed upon his journey to recover his lost health under his mother's care. The journey was too much for his diminished strength, and he was unable to rally from its effects. He is sincerely mourned, and his memory will be fondly cherished by his associates in our establishment, where he discharged with unusual skill and fidelity the difficult work of proof reading. We esteemed him for his gentlemanly bearing, and for the upright manner of his life, and we can assure his Eastern friends and relatives that his course among us was such as to reflect honor upon those from whom he came hither. He is gone but will not be forgotten.

### Mining Affairs at Eureka.

The Eureka Sentinel says: Outside districts, as everything off of the Comstock were at one time contemptuously called, are beginning to take front rank among mining localities, and this is especially true in regard to this portion of eastern Nevada. A locality that sends forth a stream of bullion aggregating monthly over \$500,000, and keeps up a steady stream of production at that rate uninterruptedly, cannot be pished and pshawed down by all the stock sharps that ever congregated on California street, and its merits are too patent not to be recognized by the veriest doubter that ever pretended to a knowledge of the resources of this favored land. Notwithstanding all the drawbacks that has attended base metal mining, and the depressions incidental to all mining communities, we can point with some degree of pride to the fact that Eureka district has contributed \$40,000,000 to the wealth of the world since its discovery, and this amount has been taken out during the last eight years. Another, and more gratifying fact in connection with our resources, is that at the present time our prospects are brighter than at any former period in our history.

The older mines are developing new and larger bodies of ore in the deeper workings, deposits that outrank in size and magnitude the surface bonanzas that made them famous, and new locations are being daily developed, giving promise that they will equal the older properties in yield and value.

#### Active Operations.

There is renewed activity all along the line. Mining experts flit to and fro, between Eureka and San Francisco, examining properties and reporting to their employers, and the owners of claims, confident of the merit of their respective mines, ask prices therefore, and readily obtain them at figures that would have been looked upon as enormous at an earlier date. There has been no notable operations during the week. The usual amount of ore has found its way to the furnaces, and the fumes pouring from the tall chimney stack are evidences of continued prosperity. The amount of work being done at present, affects all classes favorably, and every one benefits by the lively season now at hand. We made a computation last week of the number of miners and furnace men employed in the district, the total reaching 1,100. Taking this as the total number, and averaging their wages at \$4 per day, we find that from this source, coin to the amount of \$132,000 is monthly disbursed to this class, the money finding its way into general circulation and stimulating every branch and artery of trade.

The present consumption of charcoal will amount to an average of 10,400 bushels daily, or 312,000 bushels a month. The companies pay for this fuel an average of \$80,000 per month, every dollar of which is a direct contribution to a home industry, and is retained within our borders. Taking into consideration wood, timbers, and mining supplies, the amount of cash disbursed monthly, that finds its way into home channels, will not fall short of \$250,000, which we submit, is a very respectable sum, and an evidence that we are on the top wave of prosperity.

### Copperopolis and Vicinity.

From Thomas McCarty, Esq., of the old Log Cabin ranch near Copperopolis, we learn that a San Francisco company have purchased a quartz ledge, situated about two miles west of Copperopolis, and work is being prosecuted with vigor, Henry Botcher Esq., is the superintendent of the mine. It being ascertained to a certainty that the lode is a good one, a contract has been entered into to erect a quartz mill for the company, and crushing will be commenced as soon as the mill can be completed.

The Eagle mine formerly known as the old Quail Hill mine, one mile west of Telegraph City, is being worked, and large quantities of quartz have been taken out. The quartz from this mine is said to contain quite a large percentage of superior nickel.

Messrs. Saunders and Little have leased the old Napoleon mine situated one and a half miles south of Telegraph City. They are working the mine by the lixiviating process. Bluestone is also made by this same process.

The times around this section of the State are improving, and it is to be hoped that Copperopolis will once more be the important mining center that it was several years ago.—*Advertiser*.

THE TRANSPORTATION OF PETROLEUM IN VESSELS.—The Kingston British Whig, of October 5th, says: "An oil tank vessel, designed for the oil trade between Sarnia and Montreal, has just been completed. Some 85,000 pounds, or 42 tons of iron, have been consumed, and the tanks, of which there are six, three on each side, will carry about 400 tons of oil. It is the intention, we believe, to have two more tanks made to lie on the deck of the schooner to make her deep enough to sail down the lake. These will be lighted here. The capacity of the six tanks will be nearly 114,000 gallons, and the total, when full loaded, about 150,000 gallons.

LANDER HILL AHEAD.—At the Nevada State fair held at Reno recently, a specimen of ore from the Manhattan mines took the premium for exhibits of silver ores. Lander Hill ores are the richest in silver and the most showy of any produced in Nevada.

## MECHANICAL PROGRESS.

## Improved Method of Drilling for Petroleum.

As many of our readers are interested in developing the petroleum resources of the lower counties of our State, we compile from a Pennsylvania exchange the most approved method in that oily State. The system of drilling now in vogue is a great improvement on that pursued a dozen years ago in the use of "casing" to shut off the surface water. The surface wells, 300 or 400 feet deep, put down from 1861 to 1864, were drilled about two and a half inches diameter, with a set of tools weighing about 300 pounds, attached to a "spring pole," with a derrick about 25 or 30 feet high, operated by two men; the spring pole being something like the pole of an old-fashioned well, and 15 or 20 feet per day was considered rapid progress. As the weight of the tools, the diameter and depth of the well was increased; horse power and afterwards steam power was substituted for the "spring-pole." With the present system, a derrick of 65 to 75 feet high is first put up; steel-edged cast-iron driving pipe, eight inches internal diameter, is then driven through the surface soil until it rests on solid rock; then a hole, eight inches diameter, is drilled with tools, weighing about 2,000 pounds, to a depth below the surface, varying from 150 to 500 or more feet, when a "casing" of light iron pipe, six inches internal diameter, is lowered down and rested in the rock and the holes continued down, five and a half inches diameter, until oil is struck or a depth usually sufficient to reach it in that region has been attained. When the well is tubed and pumped for a reasonable length of time; if no oil is yielded, some torpedoes are exploded in it, in order to open up communication with crevices containing oil, if possible, and if no oil is then obtained it is abandoned. Sometimes the elastic force of the confined gas is so great that upon striking the crevice containing it, it forces the tools out and the oil commences to flow without pumping; at other times pumping may be required for a few days or continuously. With the heavy tools now in use, 70 feet per day is sometimes averaged. In the old method of boring without casing, the hole was kept full of water, which followed the drill down, exerting a pressure of over 300 pounds per square inch at a depth of 700 feet, which the gas must overcome before the oil would flow spontaneously, and in many cases is supposed to have driven the oil into other channels before the pump was put in, sometimes even flooding another well at some distance which had been yielding oil. By using casing these risks are prevented, as the surface water is prevented from reaching deeper portions of the well. As the tubing and casing are withdrawn from abandoned wells, they should be required to be plugged below the surface water-veins, otherwise the producing wells of the district will sooner or later be ruined by being flooded with surface water or the escape of gas.

**A NEW MAIL CAR.**—The postoffice authorities have been greatly aided by inventors in devising means to enable them to do the quick work necessary on the flying postoffices on the railroads. We read that a new and improved mail car has just been completed by the Chicago, Milwaukee and St. Paul Railroad Company for use on their road, the car having been constructed in Milwaukee by Mr. Bailey, master mechanic of the road, from plans furnished by Captain J. E. White, Superintendent of the railway mail service, sixth division. It is 50 feet in length, and has 12 wheels, carried under two patented trucks. It is fitted with Miller platforms, and the improved Westinghouse automatic air-brake. The principal improvements are, first, the increased space given; second, the new arrangement of the mail bags, whereby the distribution is facilitated; and third, the increased light and superior accommodation for the distributing clerks. In the old cars the papers were distributed into a semi-circular case, which occupied a full half of the car and admitted light from one side only. Now the bags are carried on iron racks and rest on the floor, while the letters are sorted into pigeon-holes at one end of the car. It is estimated that fully 50% more mail matter can be handled under the new arrangement within a given time than was possible in the old cars, and that the clerks can attend to this extra business with less trouble than they formerly could. A second car will be completed within the next two weeks, the cost of the two being less than \$10,000.

**MEASUREMENT OF WATER SUSPENDED IN STREAM.**—P. Gazi, in view of the difficulties introduced into calculations of boiler efficiency by foaming or other mechanical suspension of vapor, has described an apparatus for determining the degree of humidity, as well as for finding the density, either of saturated or of dry steam, at high pressures. His invention was suggested, in part, by the recent investigations of Hiru, Leloutre and Hallauer.

**A BRIDAL CAR.**—We are pleased to learn that the Cincinnati Southern railway has determined to place a "bridal car" on its line—a luxury which we are assured will supply "a felt want" in that section of country.

## Warming the Piston.

The use of the steam jacket, remarks the *American Manufacturer*, in connection with the cylinders of steam engines and the advantages attendant thereupon are well known, but the diagrams taken by the dynamometer show that a large amount of condensation still takes place; a portion of the condensed steam in the cylinder is evaporated anew during the expansion and another very important portion is also evaporated; but by taking the heat from the surrounding parts of the engine, thus causing a rapid cooling of such parts; those parts which are immediately surrounded by the steam jacket are instantly reheated; but those parts which are not so surrounded, such, for instance, as the piston and rod, are relatively cold on the arrival of the steam in the cylinder, and they therefore condense a large portion of it before they arrive at the same temperature as the steam which flows in. The object of the invention of Madam Veuve Andre, of Thann, Alsacia, is to avoid this latter condensation, such object being attained by forming the piston and piston-rod hollow; the spaces in the two parts being made to communicate with each other. Steam is introduced into the piston and rod through a pipe which is attached to the piston and passes through a stuffing box in the end of the cylinder. This pipe slides in a steam supply-pipe, which is provided with a stuffing box, and has an inlet for the admission of steam and an outlet for the condensed steam. The outlet may communicate with a pump to draw off the condensed steam.

**USING OLD RAILS FOR CAR SILLS.**—Mr. Geo. Richards, the Master Mechanic of the Boston and Providence railroad, says the *National Car Builder*, has recently built two gondola cars in which old steel rails are used for longitudinal sills. He also contemplates building a flat car for carrying lumber and a merchandise box car upon the same plan. Four 30-foot rails, weighing 57 pounds to the yard, are used in each of the two cars already built. They are placed tops down, with strips of plank bolted to their flanges as a foundation for the floor. The bolts are three feet apart, and the floor planks are spiked to the strips in the usual way. The transom timbers are bolted to pieces of iron riveted to the web of the rails and bent around underneath their reversed tops, so as to secure a complete bearing from floor to transom. The end sills are of oak, in which recesses are made with pocket castings inserted in them for the reception of the rail ends. These are held to the sills by forked bolts riveted to the web of the rails, and passing through the sills and castings. There are four longitudinal truss rods 1½ inches in diameter. The drawing attachments are put in as easily and as cheaply as in a wooden floor-frame, and the entire construction is quite simple and free from difficulty. One of the completed cars weighs 17,270 pounds, and the other 18,750 pounds, with sildings, and they have carried 34,630 and 43,550 pounds of coal respectively. Their length over end sills is 30 feet 11 inches.

**CASING SHAFTS AND GEARS.**—Many suggestions have from time to time appeared upon the subject of preventing or lessening the liability to accidents arising from the entanglement of some portion of a workman's garments in a swiftly revolving shaft, such accidents, as is well known, being lamentably common. The *American Manufacturer* says that one of the simplest methods, it would seem, of rendering these casualties impossible, without involving the necessity of constructing a railing or fender about the moving piece in dangerous places, is to cover the shaft with a loose sleeve along its entire length. This may be made of sheet-iron or zinc, and should be movable if desired; it should also be covered within, and at the ends, with leather, to prevent noise. Arranged in this manner, the friction between it and the revolving shaft will be sufficient to cause the sleeve to rotate with the latter; but in the event of any decided resistance being brought to bear upon it, as in the case of the entanglement of an operative's clothing, the sleeve will at once be brought to rest and permit of its extrication without serious injury. The same plan of loose covers is of course applicable to cog-wheels or pulleys.

**WROUGHT IRON WHEELS.**—The object of the invention of Mr. L. Schwartzkopf, of Berlin, is to make the nave and the spokes of wrought iron wheels, especially for railway carriages, without any weld and out of a single bloom. For this purpose he uses a mold of cast iron or other suitable material consisting of two parts, each part having on its face the half mold of the nave and spokes to be produced. Moreover, the upper part has in its center an opening about the diameter of the nave, and of a length sufficient to contain the bloom out of which the nave and spokes are to be made. The two parts of the mold are firmly bolted together and placed under a powerful hydraulic press connected to an accumulator or other arrangement for storing up water pressure. A bloom of proper size, to which a welding heat has been given, is then thrown into the aforesaid central opening of the upper part of the mold, and by means of the hydraulic press, a piston is made to enter into this opening, thereby pressing or squeezing the material of the bloom during its soft state into all the cavities of the mold, so as to complete the nave with the spokes at a single operation. The parts of the mold are then separated, and the finished piece is taken out.

## SCIENTIFIC PROGRESS.

## New Edible Fungi.

At the last meeting of the San Francisco Microscopic Society, as reported by the Secretary, Col. Kinne, Mr. J. P. Moore furnished the Society with the following technical descriptions of two new fungi found on this coast with remarks concerning them. The *Tremella* he speaks of, might be cultivated and cut up into steaks for a good-sized family, which would be an object these hard times. Messrs. Moore and Bigelow seem to have eaten it, enjoyed it and both live.

*Agaricus (pleurotus) nemorosus*, (N. S.p.) Pileus.—At first slightly campanulate, then in age, expanded and slightly depressed at center; cuticle thick, separable, pale yellow, and broken up into deep angular scales, which in many cases overlap each other; edge incurved; flesh thick and solid, nearly white, not changing in drying; hymenophoriform confluent and homogeneous with stem.

Gills.—Crowded, deep, coriaceous, adnate or slightly decurrent, much laciniate, pale, straw-colored, and at the edge quite farinaceous, giving a pure white color.

Stem.—Eccentric, firm, solid, tapering downward; upper portion slightly striate; dingy white; 4-6 high; rooting cuticle separating.

This fungus grows mostly on dry, exposed, rocky hillsides, among sage brush, Gold Hill, Nevada, Pileus from 3-4 broad, and readily recognized by its very deep area or scales, into which it breaks up. It has a marked and agreeable odor of decaying wood. Taste, sweetish, resembling liquorice. The whole plant, on drying, retains its color and becomes very hard, almost of a woody texture.

*Tremella fruticulosa*, Fr.—"Caespitose very large even, pallid yellow, base plicate, lobes gyroso-undulate." The above is the description as given by Fries. The specimen which I have was presented to me by Mr. H. H. Bigelow, an enthusiastic collector of fungi. Its size is about two feet by 18 inches, and from six to eight inches thick. When young it is of a pinkish yellow. Its taste and smell are both agreeable. I do not find that the *Tremellini* are put down as edible, but, on trial, I find that this makes an excellent and savory dish when young. No injurious effects were perceptible. There seems to be, however, a slightly exhilarating tendency to it. I wish that those who have experimented with this order would give us their results.

**PRESERVATION OF THE YELLOWSTONE PARK.**—In the *Tribune* report of the Nashville meeting the American Association of the Advancement of Science, it was mentioned that a series of resolutions had been passed with reference to measures for the preservation of the natural curiosities of Yellowstone park. The Secretary of the Interior is charged by law with the maintenance of that reservation as a National park, but no provision has been made for carrying out the intent of the law. The American Association will petition Congress to take active steps to prevent further destruction of the natural curiosities of the park, as their loss would be irreparable, and they have a value to science as a means of settling some open questions. The committee having the subject in charge consists of Prof. Joseph Henry, O. C. Marsh and Theodore B. Comstock, Maj. J. W. Powell and Lieut. George M. Wheeler. The first meeting of the committee will probably be held within a short time, at Washington. It is to be hoped that the measures for preserving the beauties of the park from the ravages of tourists, will be taken before the devastation is complete.

**ON THE TOP OF THE ANDES.**—*La Nature* hears that Mr. Wiener has ascended Mt. Illimani, one of the loftiest if not the most lofty of the Bolivian Andes. This mountain presents a beautiful aspect from the village of La Paz. According to the authority of M. Pentland, it has an altitude of 7,300 metres. M. Wiener has given it an altitude of 6,000 metres; M. Mehin estimates at 6,400. If these figures be exact, M. Wiener has made the highest ascension ever made in the Andes, in fact anywhere outside of Asia; here it has been surpassed by M. Johnson, who arrived at a height of 6,800 metres at the Kingdom of Cachemire, and Mm. Schlagintweit, who in 1855, ascended 6,766 metres in the Himalaya. Ascensions by means of balloons have of course exceeded these figures. M. Glaisher arrived at an altitude of 8,800 metres, and M. G. Tissandier, in the company of Sivel and Croce Spinelli attained 8,600 metres.

**THE JUMPING BEAN OF MEXICO.**—At the last meeting of the San Francisco Microscopic Society Mr. Henry Edwards stated that the so-called "jumping beans" of Mexico, which had been handed him at a previous meeting, had developed a beautiful moth of the family *Tortricidae*, and he would soon be able to report as to whether it was a new species, which he thought very probable. He stated further that this proved to be one of the few instances in which the *Lepidoptera* encroached on the vested rights of the *Coleoptera* in the way of piercing the seal capsules with their ovipositors and laying an egg which, when hatched, destroyed the seed, as the curculio and kindred insects are wont to do.

## Some New Minerals.\*

We gain from the *Polytechnic Review* some notes on new minerals described by European authorities: *Uranocircite*, phosphate of baryta and uranium resembling antinite, for which it was long mistaken, occurs in quartz veins in the granite of Falkenstein, Saxon-Vogtland. *Synrocobalite*, occurs in spheroidal forms with roselite at Schneeberg, Saxony, structure coarsely radiated, rhombohedral, in microscopic crystals. Color, peach-red; H=4; sp. gr. 4.02-4.13; blackens on ignition in closed tubes. Dissolves in warm hydrochloric acid with effervescence, compactive carbonite of cobalt.

*Szuikit* is a new sulphate of manganese. This mineral is amorphous, forms stalactitic aggregates having an uneven fracture. H.=1-5, G.=3.15. Color, a dirty white and a reddish white where newly fractured. If a new surface be exposed for several days to a moist atmosphere, it is turned to an intense red, and an increase in weight is noticeable. Two analyses made of this mineral, the one by Albrecht Schrauf, and the other by Dietrich determine the formula as being Mn. So 4 + H 2o. This mineral was found in notable quantity in an abandoned mine in Felsobanya. It is named in honor of Szmit, the counsellor of mines.

**PHOTOGRAPHING COLORS.**—Joseph Albert, according to the *Vienna Press*, has finally succeeded in inventing photography to render the natural colors in the picture by a photographic steam press of his own construction, without the aid of a pencil. I have seen some of the proofs of such colored photographs by the Albert press. An expert painter could hardly give the colors of the object more faithful in living reality and with a distinctness to the nicest shades. The secret of the invention consists in the analysis of the white light into the three colors—yellow, blue and red—and in their recovery of the three colors ready for the press. On a plate, chemically prepared, so as to receive but the yellow parts of the light, and the tones of the colors of the object to be reflected, the first photograph is taken, when a negative of that plate is at once put under the press, whose cylinder is dubbed over with yellow paint. None but the tones of the yellow colors are now seen in the impression. After that the object is photographed on a plate made to reflect but the blue colors. This plate now under the press reflects a blue impression, the cylinder being dubbed over with blue paint. In the same manner he receives but the tones of the red colors by means of a third plate. Printing the individual pictures of a yellow, blue and red, over each other, a picture is produced true to nature, the colors intermixing by having been printed over each other. The idea, long entertained and prosecuted by Albert, to photograph colors, may no longer be considered as not feasible. It is hard at present to foretell what revolution the new invention will produce in the many departments of art.

**THE AIR AS A GEOLOGICAL AGENT.**—In a foreign publication we read as follows; An all-powerful geological agent is the atmosphere we breathe. Without its aid we should know never a stratified formation. The earth would simply form a ball of truly primitive rock, resulting from the cooling down of the original nebulous mass set apart for our globe, the only variation in which primeval and perennial crust being that of the different strata of higher specific gravity towards the interior. We should have no coal, no metalliferous deposits, no rivers or seas, and no rain—consequently no denudation by "rain and rivers"—for the vapor of water could not ascend into empty space. We should have—but, last and worst of all, there would be no "we." Life would be impossible, and the earth would finally degenerate into a "pale-faced moon." That this is probably her ultimate mission cannot be denied. The only consolation is that owing to her larger size, and therefore slower rate of cooling than the moon, she will have gone through a somewhat more extended geological course. There is undoubtedly a very intimate connection between secular cooling and withdrawal of atmosphere, for the cooler the interior the smaller will be the return of gaseous elements to the surfaces; and probably before Saturn and Jupiter have cooled down to a habitable temperature, the senescent earth will roll through space—cold, void and airless. Sooner or later nothing is more certain than that—"to this favor she must come."

**NOTE ON CADMIUM.**—The uses of metallic cadmium, says a writer in the *Journal of Chemistry*, are limited to the manufacture of alloys having low melting points. One of these alloys, known as "Wood's fusible metal," melts at 70° C., and consists of

Cadmium.....	3 parts or 2 parts.
Tin.....	4 parts or 2 parts.
Bismuth.....	15 parts.
Lead.....	8 parts or 1 part.

A spoon made of this alloy, when placed in boiling water, will melt like wax. By varying the proportions, alloys may be obtained having any required melting points, and may be used as safety plugs on steam boilers. Wood's alloy is also used in taking impressions of objects and making molds. An amalgam of cadmium is sometimes employed by dentists for filling teeth.

# MINING SUMMARY.

The following is mostly condensed from journals published at the Interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**CONSOLIDATION OF MINING PROPERTY.**—Amador *Leijer*, Nevada, The Loyal lead and Pennsylvania mining companies have consolidated. The claims join each other on the north of the Gover ground. This consolidation is expected to lead to important results. The owners have already taken steps looking to the erection of a new mill. The crushings of Pennsylvania rock made recently realized handsomely, justifying the immediate construction of a mill. The contract for the work has been let and operations were started this week. The machinery of the old Loyal lead mill will be utilized in the new one as far as possible. The contractor says he will have the mill in running order inside of 50 days. The shaft of the Pennsylvania, now an incline, is to be straightened, and from this the ore for supplying the mill is to be raised. Lively times are in store for New Chicago when the Gover and Pennsylvania mines are employing their full complement of hands and both mills are in active working.

**THE ONIDA MINE.**—This mill is running its full complement of 60 stamps this month, to dispose of the piles of rock which have accumulated at the dumps during the period of water scarcity.

**THE WORKMEN ENGAGED IN MAKING A NEW FLUME TO SUPPLY THE GOVER WITH WATER EXPECTED TO GET THROUGH WITH THE JOB LAST TUESDAY.** By this time the Gover mill, we presume, is operating on the quartz, infusing new life into New Chicago and vicinity.

**VOLCANO.**—On Monday last the Volcano gold and gravel mining company resumed operations, the recent rains having increased the water supply sufficient to run their drifting machinery 12 hours. Their tunnel is in 700 feet and they have 1,400 feet farther to run in order to tap the basin, but with a drill that strikes 500 blows per minute and bores a 20-inch hole in the hardest kind of rock in 25 minutes, it will be seen that it is only a question of time, and short time at that.

**ON THE DOWNS MINE** they are getting down to water level and the fode is somewhat broken up, but the rock is good, and Bill Downs, the Superintendent, thinks they are all right for a good mine.

**THE GRIZZARD MINE** has tapped his lode with the drain that he has been running, and has now a body of ore two feet in width, 120 feet in length and 15 feet in depth, that is considered good for \$50 per ton.

**MR. BARBER, from the Danc mine,** has brought in some fine specimens and is confident that he has a good thing.

### CALAVERAS.

**BIO CLEAN-UP AT SAN BRUNO.**—Calaveras *Chronicle*, Nov. 10: A large quantity of rock—about 300 tons—from the San Bruno, at Mosquito, has lately been crushed in Garland's mill at that place. The rock averaged \$20 per ton—a splendid yield, considering that all the vein matter was put under the stamps. Sinking the main shaft has been commenced, the most favorable indications being observed in the work progress. The San Bruno is being very energetically worked under the superintendency of J. L. Hoye.

**BLUE JAY—RICH ROCK.**—The richest quartz in the world continues to be taken from the Blue Jay, at Mosquito. There is nothing to equal it this side of that place whose streets are popularly supposed to be paved with the precious metal. Dumas, *per se*, when he gave wings to his imagination through the column of Monte Cristo, never dreamed of such wealth as there is in the Blue Jay. Instead of the rock containing gold, like ordinary quartz, the ledge is a vein of gold contaminated with a little ore. We hear that a third interest in the mine was lately sold at a high figure.

### FRESNO.

**FRESNO GOLD MINE.**—Fresno *Expositor*, Nov. 10: The quartz mill designed for the Fresno gold mining company was shipped from San Francisco last Friday. It will have capacity for 10 stamps, but only five will be put in at present. The mill building is already completed, and it is expected that the machinery will be put in and the mill ready for work by the first of December. The mill will be run by water power. The main shaft is now down over 100 feet, at which depth a drift is being run on the ledge. The drift is now in about 30 feet. At the bottom of the shaft the ledge is about two feet wide and is gradually widening out, and the walls of the ledge are well defined. About 50 tons of choice milling ore are already in the dump, and it is expected that it will yield over \$150 per ton. Charles E. Striven, is Superintendent of the mine.

**PETROLEUM.**—Fresno *Republican*. From Deputy Sheriff Witthouse, who has just returned from the Coast Range, we learn that J. D. Jones, of Visalia, has dug a well 18 feet deep near the Poso Chino, in the bottom of which there is now eight inches of oil. The oil burns freely, and the owner is sanguine of finding a large deposit of it. He is now preparing to bore down to 300 feet and make a thorough test of the matter. In the vicinity of the oil discovery some Mexicans are opening a coal mine, the vein being four feet wide with other smaller veins dipping toward the main one. They are running a tunnel, and with a good prospect of developing a large body of bituminous coal.

### INYO.

**BULLION SHIPMENTS.**—Coso *Mining News*, Nov. 10: The Emigrant mining company shipped, last Wednesday, two bars of bullion; weight, 178 pounds, valued at \$3,000. Some 30 pounds of amalgam yet remains in the pans, and claims from 10 to 15 tons of five stamps.

**LUCKY JIM.**—We are informed by those who visited the mine, as also by miners working therein, that the Lucky Jim, under the skillful foremanship of Jas. Hickey, is looking splendidly, and, in fact, never looked so well, large bodies of good ore having been developed within the last few weeks.

**EXCELLENT PROSPECTS.**—Scarcely a week passes that we do not hear of some new find in this mining section. Yesterday we went to see one of the best, so far as development, of any yet brought to our notice. It is the El Monte mine, situated in the same mineral belt as that of the Defiance, Cuervo, Hidalgo, Promontorio and other important mines in this district, and situated some two miles easterly from Darwin. The mine is owned by John McEnroy, who discovered some three years since, but the work development only commenced some two months ago. An incline shaft has been sunk upon the ledge to a depth of 70 feet, following the foot-wall, and in fine ore from the surface to the bottom. We found upon the dump about 100 tons of splendid ore, all taken from this shaft, which gives some idea of the strength of the ore, no drifting having been done. The ore is good grade, assaying to run \$40 to \$50 in silver and carrying from 30% to 60% lead. A road is now being built, down an easy grade, to connect with the road in the Darwin Flat, which will facilitate the delivery of ore to the furnaces at very little expense. We do not think we exaggerate in the least when we say that the El Monte is one of the best prospects yet struck in Darwin.

**CERRO SAN JUAN.**—Cerro *San Juan*, Nov. 3: The Cerro Gordon Co., silver mining company has sold to the Cuervo mining company the Cuervo mine and such portions of the St. Louis, Capital and Grand mines as are covered by the present location of the Cuervo, situated in Darwin. The Cuervo company execute a note for 60 days for \$50,000, secured by mortgage on all their property, including future production.

**PANAMINT.**—Capt. J. G. Messie, of Panamint, paid our sanctum a visit on Monday last. The works of the Surprise Valley M. & M. Co. have been entirely closed down for the winter, two men being left in charge. None of the expected ore bodies have been so far developed in the sinking which has been going on so long in the Homelock and Wyoming mines, though the ledges are still very

powerful ones. It is certainly to be hoped that the company will resume sinking next season.

### MONO.

**THE MILLS.**—Cor. *Inyo Independent*, Nov. 3: Notwithstanding the inclemency of the weather, the mills keep dropping their regular quota of stamps. The Indian Queen mill has just completed the most successful and profitable mill of 30 days within our knowledge, and is producing a four-stamp mill, having crushed 120 tons of ore, assaying in value \$138.17 per ton, thereby producing \$22,570.50 worth of silver. Their average chlorination being 93%, and the assay amalgamation 94%, thereby producing \$1,041.64 more than the 80 guaranteed. The mill is now owing to the roasting furnace, being White's patent, with Howell's improvement, which we believe to be unparalleled in the history of roasting furnaces, together with the proficiency of the Superintendent, Mr. Howell. However, the above mentioned run was made under the direct superintendency of Mr. Mr. Adams. The Indian Queen mine, like the Diana, is being worked on what we call the tribute system. The Superintendent thinks this the most profitable. The Diana mill is producing a reasonable amount of bullion, having shipped this month \$1,500, and unsurpassed in the sage brush country for fineness, assaying about 107 fine. The Diana mine is looking up. A rich and extensive body of ore was struck recently in the 350-ft level. The stock is not on the market now. Mr. John Robinson is just in from the market. He states that owing to this Alaska snap, Lake district is almost depopulated, but feels confident the mines there will bloom and produce next summer. Parties here talk of building a road from Benton to the Lake district mines next spring.

### NEVADA.

**BLUE TENT.**—Nevada *Transcript*, Nov. 9: The Blue Tent gravel mining company's claims at Blue Tent are the richest and most extensive of any in this section of our country. The owners have spent an enormous sum of money to get the diggings opened in a first-class manner, and have succeeded admirably in so doing. On Wednesday last they set off a blast of 700 kegs of powder, and it was a success in every respect. It broke up the ground for a long distance, and, in fact, much more work was accomplished than was expected. This is the second blast that has been set off since the water gave out, and still an other of 800 kegs of powder is in course of construction, and will be set off as soon as completed. The improvements that are now being carried on are of the most extensive and most character, being greatly to the value of the property. They have had their ditches thoroughly overhauled from one end to the other, and we venture to say they are in as good condition as any in the State. Under the able management of D. T. Hughes the property is bound to pay handsomely in the future.

**RICH STRIKE.**—A number of years ago a man named Kingsbury took up a quartz ledge on Little Deer creek, about three-quarters of a mile from town, at the mouth of Pleasant ravine. He took out considerable rock after running a tunnel in about 100 feet, but it did not pay as well as he expected. He abandoned the claim and left this part of the country. About two years ago Mr. A. Coe and son re-located the claim and extended the tunnel 400 feet, and have taken out a large amount of rock which yielded from \$1 to \$12 per ton. This kind of rock did not give them much profit, but they pegged away with the firm belief that there was a rich chute of rock there, and they were determined to find it. A few days ago, to their great delight, they found the expected new chute of rock, which contained free gold and very rich sulphurates, and it is said to be as pretty and as rich rock as was ever found in that vicinity. They have taken out about 20 tons of this kind of rock, and it is now being hauled to the Murchie mill to be crushed. About a year ago the mine was bonded for \$50,000, and a short time before this pay chute was discovered the bond expired. To-day the mine cannot be purchased for \$20,000, as it shows up now to be worth more than that sum. We are glad that Mr. Coe and son have met with such good luck, for they are hard workers and deserving men.

**GRACE.**—J. Jacobs has returned from San Francisco, and will now commence active work on the Jacobs claims, at Quaker hill. We understand new hoisting works have been purchased, which will arrive in a few days. It is known that a blue gravel lead runs through the ground, and a shaft will be sunk without delay for the purpose of finding it.

### PLACER.

**SHADY RUN MINES.**—Dutch Flat *Forum*, Nov. 8: The Wild Yankee mine, superintended by Charles Wedgewood, is fitted up and ready to commence another season's hydraulic. This company, since the closing down of last season's washing, have done a large amount of work in prospecting their drift diggings, a great deal of which, though not about as rich as the first, is nevertheless pay well to work at the present rate of prices. The ground to be worked this winter pays large for hydraulic.

**THE NORTH AMERICAN MINE,** worked under the supervision of H. K. Develing, has not during the past few months worked but four men, owing to scarcity of water. This is entirely a drifting mine, and from the systematic manner in which it is being worked, and the promptness with which the claims are being worked, it is yielding splendidly. The late rains having increased the supply of water, a larger force of men will be put to work immediately.

**NEW LOCATIONS.**—The Bilk and the Charter Oak, are the names of two mining claims pre-empted recently. They contain 80 acres each, embracing the southeast quarter of section 25, and are therefore located on the Little Bear river about one mile above the mouth of the Little Bear river sawmill. At this point the river is running in bedrock, but within a short distance of the south bank a gravel wash is discernible. Both tunnels are started from the Little Bear river, and are being run in a southerly direction. The tunnel in the Bilk is advanced 100 feet in bedrock, but as yet there are no signs of gravel. The tunnel in the Charter Oak is advanced 100 feet, and is yielding splendidly. The late rains having increased the supply of water, a larger force of men will be put to work immediately.

**QUARTZ MINING AT AUBURN.**—Grass Valley *Union*, Nov. 12: On a recent visit to Auburn we learned something of the progress of quartz mining in that neighborhood. There are several mills running, mostly on custom rock, at Ophir, and considerable prospecting is being done on the divide of the Chain and the Crest of a new ledge is very satisfactory. A new quartz mill is being erected on North ravine, 15 miles west of Auburn, in the center of the district, which will be furnished with water power from the Auburn canal. Duncan hill, one mile west of Auburn, is the scene of busy operations, and the developments made upon the Centennial mine, on that hill, are of a most encouraging character. The location of one of the ledges being in the series of east and west veins which traverse the district, and have been noted from the early days of California mining for prospecting well in the croppings. No systematic work was ever done upon the Centennial mine until about a year ago, since which time work has been steadily prosecuted. The main ledge is now down 120 feet, and the lower shaft is down 105 feet. At the bottom of the incline the ledge is from 15 to 25 feet in thickness, and shows well in free gold and sulphurates. The ledge is in a metaphoric slate, which is highly mineralized, and makes firm walls. A level has been run at the depth of 105 feet, connecting the two shafts, and at the bottom of the main incline (170 feet) another level has been started. The location of the mine

is very favorable for working, there being scarcely any water to handle, and so far but little blasting ground encountered. The quality of the rock is very similar to that taken from the best mines of the Grass Valley district, mills easily, and pays handsomely, as we were assured that the rock taken out and crushed had averaged \$10 per ton, and the rock being taken out at the time of our visit, from the depth of the lowest workings, was estimated to go \$100 per ton. All appearances go to indicate that the Centennial is a really valuable mine, and when the drifts have been sufficiently extended and stopes opened, to demonstrate that the mine is one of the best of size and quality, it will take rank among the good mines of California, and its success will go far toward the development of the resources of the Auburn quartz mining district, which should be among the very best districts in the State, although it has been greatly neglected by mining men and energetic prospectors.

### PLUMAS.

**WORK SUSPENDED.**—Plumas *National*, Nov. 10: We are sorry to have to note the cessation of operations on the Franklin mine for the present. The machinery which has been used by the company proved totally inadequate, and one day's work was done, and the mine was suspended. The shaft is 204 feet down, and it is said to have to go from 20 to 40 feet farther to strike bedrock. What the managers of the company propose to do we do not know, but it seems as though, after an expenditure of nearly \$22,000, they would certainly risk enough more to find out what is in the channel. It seems almost a certainty that the channel is a rich one. The Franklin shaft goes up deep into the mountain, and the Gravel company are on a higher bar, and that, too, on the "long side" of a bend in the old river bed. Now the experience of river miners is that the "short side" of a bend is invariably the place to look for the rich deposits, and if the "long side" shows such paying gravel as is to be found in the Blue Gravel claim, the channel itself must be rich. We cannot state the exact value of the mine, and believe that if the company put on machinery of sufficient capacity to pump the water and complete the shaft, they will be rewarded by opening a claim worth a hundred times the amount of their investment.

**GRANITE BASIN.**—Batchelder & Brown are running their little quartz mill in this new mining district with good success. The ledge is about three feet in width, and pays well and rapidly. The mine is now running at figures per ton, but in the short time the mill has been running they have sold some \$3,000 worth of dust. They have found a streak of decomposed quartz in the granite below the mill, which they are now working, and which promises to be rich. "Bach" has the reputation of being the best quartz prospector in the county, and it seems that his recent discovery in Granite basin proves it. Serrin & See are opening another ledge near by, and have good chances for a paying mine. The chances for a good district at Granite basin are very flattering.

### SIERRA.

**MONTE CRISTO.**—Mountain *Messenger*, Nov. 10: This company has instructed Mr. Day to make every arrangement for working this winter. No effort will be spared to complete the tunnel, and get ready for a new mill by spring. The Secretary of this company, T. G. Humphrey, Esq., from Stockton, has been at this mine within the last few days, and has gone below again perfectly satisfied with everything done in connection with the mine. This ledge prospects well and is in every way likely to be a success.

**RELOCATED.**—The old Sierra Nevada Lake, water and mining company's ditch has been relocated recently. Where the locators intend to get water to run in it we are not advised. Perhaps they may find water for a portion of the year.

**FOURTH CITY.**—Our rain has started the water but very little. The Bald Mountain mine was able to wash the most of last night. The North Fork mine at last, the little accident occurred in the North Fork mine last night, by which Supt. McDougal and a man by the name of McDonald were slightly injured. They put off a blast of giant powder in a body of pipe day, to make a connection, and supposing it had blown through, commenced to dig a hole, and when they got to the bottom, instead of finding it had found vent in a seam and when suddenly weakened the concentrated gas from the powder, blew the dirt into their faces in such a manner that at first it appeared to be a second explosion. Both eyes of McDonald and one of McDougal's were well filled.

### VENTURA.

**GOLD.**—Los Angeles *Express*, Nov. 10: Mr. Eggleston exhibited in our sanctum this afternoon 50 ounces of gold amalgam cleaned up from two weeks' run of the 10-stamp mill at the Frazier mine. The amalgam commands \$17 an ounce in its crude state, and makes an average of about \$10 a ton for the ore reduced. This mine is located in the Piru district, Ventura county, and is owned by Maxwell & Co.

## Nevada.

### WASHOE DISTRICT.

**CALIFORNIA.**—Gold Hill *News*, Nov. 14: Daily yield 650 tons of ore. The ore stops on the 1650-ft level continue their usual yield of rich ore. The lateral drift in the ore vein on this level, running to connect crosscuts Nos. 3 and 4 is now in a distance of 23 feet, the face still in rich ore. East crosscut No. 4 is in 90 feet, the face still in low grade ore. The connections between the upraise from crosscut No. 1 and the main shaft will be completed, and a good circulation of air obtained on that level a day or two more. On the 1600-ft level the vein is widening to the westward, the character of ore showing better as the stopes advance. The ore stops on the 1550 ft level continue their yield of rich ore.

**CON. VIRGINIA.**—Daily yield 550 tons of ore, keeping the mills churning at full capacities. The ore stops on the 1650-ft level are showing splendidly, and the usual quality of good ore. The conjunction of the east and west ore bodies on this level going south gives a continuous body of pay ore, from wall to wall of the ledge, of a very rich quality. No work is yet being done at the 1550-ft station in the C. & C. shaft.

**CALIFORNIA.**—The north drift on the 1600-ft level is being rapidly advanced toward the north line, the face in fine healthy vein matter.

**JULIA COX.**—The face of crosscut No. 1 on the 1500-ft level has passed through a fine character of ledge matter for over 100 feet and has now reached the west clay wall. East crosscut No. 6 on the same level is steadily advancing, the face in soft porphyry streaked with seams of clay and quartz, and a strong seepage of water coming in from the ledge. The chance of finding the east vein in this drift are growing more favorable.

**YELLOW JACKET.**—On the 2200-ft level the main drift east toward the new shaft is in 504 feet, and the last five feet of it as well as the face is in a solid body of quartz, assaying from \$5 to \$11 to the ton. Some water is coming from it. The new shaft is down 970 feet, and sinking in the soft ground.

**OPHIR.**—Great interest has been created during the week in this mine by the finding of a fine vein of good ore, 10 feet in width, in the east drift on the 1900-ft level. This ore was struck at a point 390 feet east of the shaft, and is evidently but the tail end of a good-sized body of ore lying somewhere in the immediate neighborhood. The drift, at the mouth of the vein, which is about 200 feet long, passed through and into what is undoubtedly a horse of porphyry, beyond which it is more than probable that the ore will be again found. There are no other changes of importance in any other portion of the mine. Work is progressing as usual at all points.

**SILVER HILL.**—The north drift on the 650-ft level is steadily advancing at the rate of 45 feet per week, toward the south line of the Justice. The east drift on the 800-ft level has advanced 28 feet during the past week, the face being in very favorable ground. M. C. Hillier, well-known as a mining man of much experience, has been appointed Superintendent and commences the management of the mine to-day.

**SIERRA NEVADA.**—The connecting winze between the

1500 and 1700-ft levels has been enlarged and put in the best condition possible, preparatory to starting an incline to prospect the ledge at greater depths. Preparations are being made to do some active sinking on the ledge and lively prospecting to the south and eastward on the 1700-ft level, very short time.

**UTAH.**—The north drift at the 1350-ft level is fairly started and is being pushed vigorously toward the ore vein. The south drift on the 1150-ft level, running to connect with the north drift from the Sierra Nevada, is making good progress and will complete the proposed connection some time during the coming week. This will thoroughly ventilate and cool the mine to that depth.

**OVERMAN.**—The east and south drifts on the 1400-ft level are being steadily advanced, the face of the east drift being in porphyry, carrying occasional streaks of quartz. The south drift is following the course of the vein, which shows a greater concentration of the ledge as the work progresses toward the south.

**RELIOS.**—The air connections between the upraise and the main incline on the 1500-ft level have been completed, and a drift started south in the ore vein to more thoroughly prospect that portion of the mine. The north drift on the 2000-ft level of the Imperial is steadily advancing, the face in quartz mixed with porphyry.

**JUSTICE.**—Daily yield 300 tons of ore. The upraise from the 1000-ft level has completed a connection with the 500-ft level, giving a much better circulation of air.

**NORTH COX, VIRGINIA.**—The mine was closed up last night before last, everything working the very best day. The new strike in the Ophir has infused new life into the managers and stockholders of this mine, as their claim lies in a direct north and south line with the new discovery.

**GOLD & CARRY.**—The machinery is working well and good progress is being made with the prospecting at every point.

**CROWN POINT.**—About 50 tons of good milling ore per day is being taken out of the 1600-ft and 2300-ft levels. The ore stops on the 1600-ft level still show fine ore, and the face of the south drift on the 200 level still continues in a fine character of ore.

**BROWN.**—Sinking the south winze below the 1600-ft level is making excellent progress. It is now down 123 feet. The main drain shaft is down 160 feet below the 2000-ft station.

**CHOLAR-POHOS.**—Driving the east drift on the 1500-ft level was resumed during the first part of the week. It is now advancing at the rate of four feet per day. About 50 tons of ore per day are being extracted from the old upper workings. The assay value of the ore is \$20 per ton.

**DALE & NORCROSS.**—In the main incline the lava has now been passed and the head of water appears to be completely overcome, so that there appears to be no impediment whatever to soon reach and drain the 2000-ft level.

**SOUTH COMSTOCK.**—The north cross-drift on the 500-ft level is now in 95 feet from the main shaft, the face showing quartz which gives low assays, improving as the drift advances.

**BEST & BELCHER.**—Sinking the winze below the 1700-ft level is making good progress. West crosscut No. 1, on the 1700-ft level, is in 120 feet, the drift having passed through several streaks of quartz during the week.

**SUCCESS.**—Sinking the shaft goes steadily forward, and the material at the bottom of it is the most encouraging description. It is bird's-eye porphyry, with good looking seams of quartz.

**ALTA.**—The bottom of the shaft is in soft vein matter of a favorable character. The bottom of the winze being sunk below the 1050-ft level is in ore.

**CON. IMPERIAL.**—The station in the joint Alpha-Imperial crosscut is finished, and sinking the joint winze commenced.

**DALE & NORCROSS.**—Ore extraction from the 350-ft level goes forward lively, keeping the Vivian mill steadily running. The bullion yield of the ore is not, of course, ascertained as yet, but it is bound to pay.

**NORTH DAYTON.**—The lower tunnel has been cleaned out and put in good repair, and now the exploration of the ledge is being commenced. The pumps are running splendidly, lowering the water daily. It is now down 143 feet below the 1900-ft level.

**LADY WASHINGTON.**—The machinery has been thoroughly overhauled and put in complete order, work was resumed in the mine this morning.

**MEXICAN.**—Sinking the joint winze on the Ophir line is making the best of progress, so also are the prospecting drills on the 1405-ft level.

**LADY BRYAN.**—Not ready for resuming work.

**SITRO TUNNEL.**—Very good progress continues to be made in advancing the beader, the face being in favorable working material.

### CORNUCOPIA DISTRICT.

**MINING PROSPECTS.**—Cor. *Silver State*, Nov. 12: Tuscarora, lately, has overshadowed us, and it is hard for a Cornucopiate to continually tell of the buildings here that have been torn down and taken over there this last summer and fall; but that business is closed now, and we cannot help thinking that those who are left here are better off, and that many who have left will, within one year from this, wish they were back here again. The mining outlook for this camp never was brighter. True, Cornucopia stocks are "way down in the market, but we feel that that is no criterion to go by. The developments in the Leopold are most favorable. The other day, in the south-easterly drift from the 900-ft level they struck water, and there is every indication of soon hitting a fine body of ore in that mine. Mr. Coffin, the Superintendent, is now in San Francisco making arrangements for the funds to settle up all back delinquencies of the company. The Hussey cannot, from its present showing, be too highly spoken of. Every day's work in this mine demonstrates the fact that it is a mine of the first-class. They are now working their ore at the Leopold mill. During the last few days they have had about 90 tons worked there, which turns out well; but the workings at the mine show that they have a body of ore in sight which will work up into the hundreds—sufficient to supply a 20-stamp mill for a year's run at least. The Panther hoisting works started up a few days since, and make quite an addition to our camp. Superintendent Willard says that the company will have a mill of 20 stamps next season, and be shipping large quantities of bullion.

### ELY DISTRICT.

**RAYMOND & ELY.**—Poche *Record*, Nov. 10: The work is going on in this mine with satisfactory result. The winze being sunk from the 1200-ft level is down about 50 feet, and as yet have encountered no water to interfere with the progress being made in sinking; are shipping the usual quantity of ore from the mine, which is working well. The mill is running along as usual, producing bullion at a fair rate, \$14,000 having come up on Wednesday, and there will be \$8,000 more come up to-day. The tailings are now being worked with much more satisfaction than ever before.

**DAY MINE.**—The work of development and opening the mine is being pushed with vigor and with satisfactory results. Work is kept up on the two tunnels night and day. Whilst excavating a place on what to build the blacksmith shop, near the mouth of tunnel No. 1, a large body of fine ore was developed, which has been opened about six feet, showing well that distance.

**ALPS CONFRATY.**—The usual amount of chloride ore is being taken from the Yerington stoep on the ninth level. The development on the 11th level is still improving; a drift has been run 65 feet on the vein and stoping commenced during the week. It is expected when both stopes are open, sufficient ore will be mined to run the mill up to full capacity. Sixteen hundred feet steel wire cable has been ordered and will arrive about the 20th inst., when it is the intention of the company to sink the shaft 100 feet deeper, making total depth 1,340 feet, and then drift west. \$27,000 in bullion was shipped by the company during the month just past.

### EUREKA DISTRICT.

**EUREKA COX.**—Sentinel, Nov. 10: The magnificent ore body of this company, first found on the ninth level,

### Meteorological Analogies.

EDITORS PRESS:—Is not your querist, in issue of October 20th, who suggests that the rainfall in Australia may be the gauge of our rainfall, a good deal out in his reckoning? It is well known that the rain-bearing currents originating in the tropics have a westward velocity of something near 1,000 miles per hour, and, as they go north, this motion bends them to the westward, giving us a southeast wind. In the nature of things, we cannot, therefore, receive more than partial showers from the Pacific, while currents originating in the Caribbean sea would take us in their course. Now is it not more probable that the rainfall in old Mexico is the true gauge for our coast? Of this much, at least, I am certain, that floods in Mexico are almost invariably followed by floods in California, and I feel confident that a study of this subject, by some one possessing the necessary facilities and time, will aid us materially in predicting our seasons.—A READER, Davisville, Cal.

We have little faith that any constant correspondence or sequence can be found between special localities in the northern and southern hemispheres, as our querist upon this subject, a few weeks ago, believed. There is a general relation between the aggregate rainfalls north and south of the equator, and the northern hemisphere has about one-third the greater downfall. Keith Johnston, who was one of the earliest of the modern school of investigators on this point, computed the average annual rainfall in the southern hemisphere at 26 inches, and in the northern at 37 inches. Later writers think averages drawn from fuller data will reduce this estimate somewhat, but will still show considerable difference. While this fact is upheld by Reclus, Flammarion, and Arnold Guyot, and all of them have written carefully of the causes affecting the distribution of water upon the surface of the earth, we find in none of their writings, which we have read, any hint of a relation between special regions north and south of the equator in the sequence of wet or dry seasons.

That there are relations between the two hemispheres, taken as a whole, is thus expressed by Elisee Reclus, in his large work on "The Ocean": "By a remarkable contrast, the northern hemisphere, which receives the greatest quantity of water, supplies the least proportion of it. In fact, the ocean restricted in the north by continents, spreads on the south of the equator, so as to cover almost the entire circumference of the earth. It thus presents to the solar rays an immense surface of evaporation, incessantly feeding the clouds of the atmosphere. In this way that half of the globe which furnishes the most vapor is that which receives the least rain in exchange; a circuit of the aerial currents is, therefore, necessarily established between the two hemispheres, and thus equilibrium is maintained. It is in great part the vapors from the southern Atlantic, that supply the rivers of Europe."

Although such general interchanges between the hemispheres are noted, the question assumes different form when application is made to special regions. To California, especially, with its climate, which may be termed accidental and not that generally prevailing in our latitude, it may be difficult to apply lessons drawn from conditions elsewhere. Of our exceptional location, Arnold Guyot says: "General laws governing the rainfall are often considerably modified by the structure of the continents, the local features and the climatic situation of the different countries in each belt. California, for instance, and the Southern States east of the Rocky mountains, are on the belt of winter rains, and still the regime of their rains is entirely opposite."

Regarding the points made by our correspondent, whose letter is printed above, we can only observe that he is altogether wrong in his premises, and therefore wide of the mark in his conclusions. The earth moves from west to east, thus giving the sun an apparent westward course. The currents of air from the north pole, as they traverse southward, find themselves continually lagging behind as they approach points on each lower parallel which have a greater eastward motion. This current moving south and west gives rise to what we designate as northeast winds. Now if we reverse this, as is the case with the currents moving from the tropics toward the north pole, we find that the currents start with a high impulse towards the east, or an eastward speed 1,000 miles per hour greater than the eastward movement at the north pole. As they pass northward they find themselves continually more and more in advance of points on parallels they traverse, and the result is a movement towards the north and east, and this gives rise to what we term southwest winds. It is upon these winds we rely to bring us the humid vapors rising from the tropical regions of the Pacific ocean.

With this corrected starting point in his reasoning, our correspondent will find that the great quantities of vapor gained from the Gulf of Mexico and the Caribbean sea are carried by southwest winds towards the western coast of Europe, where they are, in fact, deposited. There is no movement of humid tropical currents from the Caribbean sea toward this coast. If there were the now arid regions of New Mexico and Arizona would be plentifully watered, and our coast would probably be as dry as is the coast of Peru. If, then, it be true that seasons of floods in Mexico correspond with seasons of floods in California the coincidence may be accidental, during a short period of observation, or, if constant, the causes must evidently be other than our correspondent imagines.—Pacific Rural Press.

### Rural Homes.

Our illustrations on this page show two pretty rural homes, and they may be suggestive to California home-makers. They are just such light and graceful structures as our gentle climate demands. Not upon us is laid the costly weight of fortress-like habitations, impenetrable to hoisterous blasts or silent power of frozen mercury. Home comfort and cosiness are not bought in California at the price of "listed" doors and doubled windows, nor need enclosing walls be measured by the cubic foot. No! give us hut tight "weather hoarding" and a touch of snow-white plastering within, and a pretty open fire will have full power to repel the fiercest

in the line of home making is the comment of all travelers in all directions. And this is but the beginning of the end. The coming year, if its realization be but a part of the promise, which the easily falling rains declare, will give rural building throughout our State a brisk impulse forward. Thus it ought indeed to be. The outcome of the season just passed has been much better generally than was anticipated. The proper place for the investment of farming surpluses is in the improvement of means for production and in the improvement of rural homes. Thus invested, surplus earnings are safe and gloriously productive, both in marketable commodities and in family comfort and content. Never in the history of our State have building materials been so cheap and abundant as now. Never has constructive

[DESIGN FOR COUNTRY VILLA AND CARRIAGE HOUSE.]

winter chill which most of our counties ever know.

This is indeed a great advantage on the side of the California home-maker. Thus it is that a pretty cottage answers most of our farmers' needs, and if it be tasteful in design, neat in furnishing and beautiful in surrounding growth of tree and shrub and flowering plant, it is a home than which princes have no better. Nature aids us not alone in temperature and sunlight, but hides these potent agencies serve us farther. It calls up around our homes a growth of luxuriant foliage and crowns of fragrant bloom. It gives us hedges and arbors of plants which in severer climes cannot escape the compass of the jardiniere. It covers our roofs with vines which there creep but sluggishly around the fire-warmed window frames. It surrounds

skill been so plenty and so desirous for employment at reasonable wages. The plain deduction is, build and beautify.

The cottages, which our illustrations show, are simple and inexpensive. As such they can hardly fail to come within the means and answer the needs of the humblest of our readers; and yet are they not very tasteful and suggestive of simple beauty and comfort. One is just such a habitation as one of our young men could plan to encase his little family, and the other is commodious enough to serve as a casket for quite a string of home jewels. They are put forth on our part as little more than suggestive of what can be done in designing homes of moderate expense, and we doubt not readers can remodel them and devise interiors according to their tastes and ideas of convenience. We he-

RURAL COTTAGE AND BARN.

our habitations with vineyards and orchards of fruits which there must have glass above and fire beneath. And yet, with all these generous gifts, by far too few are pretty rural homes. In some instances, the newness of the settlement and the harsher duties of payments for the land itself have, thus far, crippled handsome home building and adornment. In others, there is a lack of taste and deplorable disregard of everything which does not yield according to the standard of the dollar, but this condition of affairs is rapidly passing away. In still other instances there is an unexplained neglect, as though the cultivators of the soil had forgotten how easy it is to give the house a tasteful outline.

We have no doubt that the closing year will add hundreds to our lists of pretty rural homes. We hear of them from all the wide circle of our readers. The improved aspect of the country

lieve every family should have a voice in the planning of its own home. Build your homes. The RURAL PRESS will be a delighted guest at the "house-warming."

METEOROLOGICAL SUMMARY FOR OCTOBER.—The report of the U. S. Signal Service officer, of San Francisco, for the month of October is summarized as follows: The mean height of barometer for the month was 30.01; mean temperature, 58.2°; mean humidity, 71°; prevailing winds, west; highest barometer, 30.174; lowest, 29°; highest temperature, 81°; lowest, 1.871; monthly range, 32°; greatest velocity of wind, 38 miles per hour; total number of miles traveled by wind, 6,896; total rainfall, .65 of an inch. Rainfall in October during former years: 1871, .07 of an inch; 1872, .11 of an inch; 1873, .83 of an inch; 1874, 2.69 inches; 1875, .24 of an inch; 1876, 3.36 inches.

### The Irreverent Spirit.

The irreverent spirit is a demon of destruction. We take it for granted that irreverence toward the Almighty is the highest crime to which the irreverent spirit can attain, but it is our present purpose not to demonstrate this leading proposition, but to bring to mind a few of its corollaries as they are suggested by the events of the day.

At the present time both the city and the country are forced to think seriously of adopting unusual measures for the defense of life and property. In the city, under the glare of the street lamps and in halls for public concourse, words of ruin are spoken and threats and menaces are made against the lives and property of citizens. Long suffering and hopeful authorities have determined that free speech has overstepped its rights and privileges, and the law has placed its hand upon mouths which gave loudest voice to incendiary threats. In the country, threats of the torch have been freely made, and there are farmers in our State who have divided the night into watches and mounted guard to save their property and lives from the match of the barn burner, creeping through the darkness. Both in town and country there are those who freely threaten destruction and those who believe the danger is great enough to call for measures to avert it. Such is the present situation. It is a condition of affairs which is ruinous to the prosperity and comfort of our citizens, fatal to the progress of our State, an insult to our civilization. Society cannot tolerate it. The law proclaims against it. If it should be permitted to gain the ascendancy, we should be plunged at once into a recurrence of those dark days, which history describes and which cause the reader to shudder and grow sick at heart. The mind recoils from the thought that such events can occur in our day of light and law, and we have no idea that the law-abiding and enforcing classes of our population will permit the evil to proceed to even temporary victory. But let no one forget the possibility of evil in the fancied security of belief that it is powerless. No one can tell to what end of madness the ill propensities of reckless men may be driven by the wretched devices of the demagogue. It is the duty of every true citizen to do everything within his power to strengthen public sentiment in favor of the right and the rule of the law. No doubt the constituted authorities will guard against overt acts, but let all warn the unwary, counsel the weak and wavering, explode the fallacies of the heartless and reckless "agitator"; in short, see to it that the good sense and true strength of the people are not stolen from it by those who aim to live upon the fragments of the destruction which they may lead others to execute.

Such being our general exhortation, it is timely to make prominent the one cause to which the present danger owes its origin, and urge its repression. It is the irreverent spirit. If it be not repressed, by wholesome restraint and by inculcated perception of its ruinous tendency, it generally overflows in manhood into a stubborn and reckless defiance of laws, human and divine; a bold disregard of rights of property and a total appreciation of the value of human life. Destroying all respect for others, it, naturally enough, destroys all self-respect. It leads men, on the one hand, to perpetrate the most satanic crimes, and, on the other, to stoop to the most debasing ambitions and alliances. It misguides the intellect; it banishes all true impulses; it blunts all perceptions of right; makes the world the worse for every life over which it gains control.

As it is in youth that this irreverent spirit generally begins its ever widening course, in youth it is easiest repressed. All streams are easiest turned near their sources. The wide prevalence of this spirit should, then, read a sharp lesson to all those who are now charged with the training of the youthful mind. Here lies the key to the future. The reckless men who now raise seditions cries in our city streets, or lurk in sullen silence in country shades, are beyond the reach of any power but that of the law. Their hopeless condition is a most potent warning. They came not suddenly into their evil state. Perhaps their first lesson was in unpunished disobedience to parental authority. The steps from disobedience in youth to lawlessness in manhood are rapid as the flight of the years. If the tender mind is uncultured in the reverent thought the sure result is an intellect deficient and wayward, false in its conceptions and reckless in its actions. The youth who is not taught by sound precept and right example, will, in the majority of instances, never have a true perception of right or justice.

Experience is a good teacher, and those whom either thoughtlessness or engrossments in the world's affairs lead to forgetfulness of precept, can hardly shut their eyes to events which are now passing. Let the uprising of the turbulent and law-defying spirit to-day enforce the resolution that no one shall go out from our households to swell the ranks of future organizers of evil. We have already developed on this coast a style of youthful depravity so peculiar and so demonic that we have been forced to give it a special name. The poor city outcasts are all the seeds of future "hoodlumism" which this generation can afford to sow. Let those who rule and guide the youth in country homes be true to the charge placed upon them. It is in such homes that the true reverent spirit may best be instilled into youthful minds.

## The Greenville Quartz Mines.

During a run over in the Greenville country last week, we gathered some mining notes which indicates that that section is sound in the quartz line, and sure to show well in results in the future. Much prospecting has been done in the past few months, and many ledges have been found which only await the necessary capital to open and develop them, to make them paying enterprises. Quite a large number have been opened, and among these the Soda creek mines are in the lead. First on the list is the Plumas National company's mine and mill. This is the location made by Ellis & Lowery, and sold to Lawrence and Reed. The new mill is now at work, and the results are very flattering indeed, the rock paying from \$14 to \$15 per ton, with ordinary stamps and batteries. Of course nothing but free gold is saved in this process. Fully 3% of the rock is sulphurets, and assays have proven them to be worth hundreds of dollars per ton. The company have ordered eight of Hendy's concentrators, four of Hendy's ore-feeders, and a supply of pans and settlers—\$7,000 worth in all—which are now on the road, and will soon be up and running. The company propose to make the mill worthy of the mine, which gives every assurance of being one of the best in the county. The vein is a true fissure vein, in slate walls, and carries an average width of six feet. It is thought the rock, when the new machinery is in, will pay regularly, upwards of \$20 per ton.

A short distance from the Plumas National is the location of Compton, Williams & McBeth, a fine ledge, and showing better and better as the work of development goes on. No mill has yet been put up, but a crushing of 125 tons of the rock has recently been made in the Kettle mill at Cherokee, which resulted in an average of \$13 per ton. The rock was taken out while prospecting, and was not the best in the mine. With good machinery and everything in running order, it is thought that it can be made to work up to \$20 per ton, and possibly more.

The old Indian Valley mine is under the management of Mr. Jno. Blood, who is "reconstructing" it, and putting it in shape for a permanent working. This mine was badly worked, and, as will be remembered, caved several times, once with loss of life. It is known that a portion of it never was worked, and when again opened in good shape, it will pay big dividends to the future owners.

At Wolf creek much labor is being done, with good results. The Wisconsin mine is showing well—14 feet of pay rock, and the 10-stamp mill now in operation, shows it to be worth \$9 per ton.

The Gold Stripe company have their mine in good condition for winter, and it is said by good judges that the ledge never looked better. They have a very large vein, a part of which is rich, the balance being "low grade." They "breast" it all out and crush it altogether, which brings down the figures, and in the judgment of some good miners, is not the way to work it. But one thing is certain, it has proved itself a valuable mine, and promises to last for several years to come.

Mr. Blake, a San Francisco capitalist, has purchased an eight-stamp mill from the Gold Stripe company, and intends to work rock from the Wilson mine, which, we are informed, he has recently purchased for \$16,000. This mine is near the Gold Stripe, and is certainly valuable.

Messrs. Vance, Peck & Coble, and Levi Austin have opened lodes on the north side of Clear creek, which show free gold and promise well.

Quite a number of "prospects" are being made, some with flattering indications, and the evidences of a future prosperity for the Greenville quartz miners, are plenty. We wish them the best of good fortune, for much depends on their being successful.—*Plumas National*.

**PLIOCENE.**—We visited the Pliocene works a few days since, and found the work of getting ready for winter advancing rapidly. The buildings are all up except the boiler house, which was being erected as fast as men could do it. The boilers are set (two being used) and the smoke-stack up. Wood and lumber are coming in rapidly. The engine is on the ground and is said to be the one used at the Mechanics' fair of '66 to run all the machinery. It looks as though it might be powerful. The foundations for this machine, now being laid, are superb, consisting of huge square timbers. The good weather will enable the company to get in good order before snow comes, and it will be necessary to do so as it is a "snowy" country, to be sure. The company realize this fact, and have provided a dozen pairs of snowshoes, for the use of the workmen. The shaft is down 55 feet and substantially timbered. In the setting of the boilers they are using lava rock, and for lining the furnaces and finishing, they employ a soap-stone brought from Plum valley, which is worked to the desired shape and size with a hand saw, and appears to cut as easy as old cheese. It makes a handsome finish and is said to wear indefinitely. This company is doing a land-office business in the way of fitting up for a permanent work. If there is any gold in the channel they will find it, and when it is found they will be in a condition to take it out at a minimum of expense and with celerity.—*Mountain Messenger*.

## Useful Information.

## Finding Iron Ore with the Magnetic Needle.

Prof. Thalin has communicated to the Swedish Scientific Academy a paper of much importance on a new method of prospecting for iron ores by means of the magnetic needle, which is described as follows in the *Iron Age*: At a great number of points in a field which is to be prospected for attractive iron ore, the horizontal components between the magnetism of the earth and the distributing force of the ore deposit are measured, and with the aid of these observations isodynamic curves are laid down, from whose form and nature conclusions of the location and importance of the ore deposits are drawn. The instrument by which the above field operations are performed is called a magnetometer, and consists in its principal parts of a common tripod-compass graduated only into whole degrees. From the compass-box a horizontal arm extends, upon which the field magnet required for determining the direction can be laid in such a manner as to keep constantly the same distance from the movable needle. In addition to this, the instrument possesses a leveling apparatus and a diopter with tangent-screw. The diopter can be fastened to the horizontal arm. In using the instrument the needle of the compass is set on zero, while the deviation magnet is left loose; after the latter again occupies its former position the angle of deviation is read. In order to be able to arrive at accurate conclusions about the location of the ore deposit, a great many of these observations must be made. For this purpose, the field is first subdivided into squares, with sides about 100 feet long, after which, at each corner, observations of the intensity are taken. It is easily ascertained whether more readings will be required at intermediate points. After these measurements are plotted, the points of equal angles of deviation are to be connected. These isodynamic curves are in an ore field usually closed lines, and they group around two distinct points. One of these points is situated north of the ore deposit. It is determined by an angle which is greater than any other, and which is called the maximum angle; the other point is situated in a southern direction, and determined by an angle smaller than any other, and which is therefore called the minimum angle. The former point corresponds to the least intensity, and the latter to the greatest. Underneath the connecting lines of these two points, which Thalin calls the magnetic meridian of the ore field, the most important portion of the ore deposit is, in general, to be expected. This method, in its application to prospecting, for attractive ores, has proved to be very useful, and at several places magnetic maps have already been delineated.

**TO REMOVE MILDEW.**—Wet the spot in lemon juice, then spread over it soft soap and chalk mixed together, and spread where the hottest rays of the sun will beat upon it for half an hour, if not entirely removed repeat the same. Or wet in clear lemon juice and lay in the sun; or soak for an hour or two, and then spread in the sun. Or mix soft soap, powdered starch and half as much salt together, and moisten quite freely with lemon juice. Spread this on both sides of the spots and spread in the sun. As soon as dried wet the spots again with the same mixture, lay in the sun and repeat the operation till the spots disappear. If newly spotted once wetting will be sufficient. Or wet the spots in chloride of lime just dissolved in water, and spread in the sun only a few minutes, then rinse. Repeat if the mildew is not all removed; but do not let this preparation remain but a few minutes at a time before rinsing, even if the process has to be repeated several times, as chloride of lime will injure the cloth if left on long.

**THE BLEACHING OF SPONGES.**—As the bleaching of sponges by means of sulphurous acid or chlorine is injurious to the health of the operator, a writer in a foreign journal recommends a process in which no noxious gases of any kind are evolved. The sponges are first soaked in hydrochloric acid to remove the lime, then washed with water, and immersed in a 2% solution of potassium permanganate. When taken out they appear brown, from the despotism of manganese oxide, which must now be removed by steeping them about two minutes in a 2% solution of oxalic acid, to which a little sulphuric acid has been added. As soon as the sponges appear white, they are well washed out with water, to remove the acid. Strongly diluted sulphuric acid may be used in the place of the oxalic acid.

**HOW TO DISTINGUISH STEEL FROM IRON TOOLS.**—It is impossible to distinguish between iron and steel tools; they have the same polish, the same workmanship; use will commonly alone show the difference. To make this distinction quickly, place the tool upon a stone and drop upon it some diluted nitric acid (four parts of water to one of acid). If the tool remains clean, it is of iron; while if of steel it will show a black spot where touched by the acid; these spots can easily be rubbed off.

**ENGRAVING ON SILVER.**—Cover the silver-plate with wax, engrave into the wax down to the metal, pour nitric acid on the plate, allow the acid to corrode the metal, wash off and remove the wax.

**MICROSCOPIC EXAMINATION OF FLOUR.**—To ascertain whether there are *acar*i in a specimen of flour M. Troupeau in the *Journal of Chemistry* recommends to place some of the flour between two sheets of paper, and thin it out by pressure with the finger. If *acar*i are present they soon reveal their existence by appearing as small molecules, visible to the naked eye. These may be transferred by means of a moistened point to the stage of the microscope. To study the legs and hairs of *acar*i it is indispensable to use a mixture of glycerine and acetic acid, which increases the transparency. To avoid bruising the insect a hair should be placed between the plate and the cover-glass. Examining in this way a number of specimens of flour, of various source and age, M. Troupeau has found that nearly all have contained *acar*i, and that these animals are more abundant the longer the flour has been exposed to the action of air and moisture.

**OZONE FROM FOUNTAINS.**—That fountains are ornamental no one disputes, but according to a paper read by Mr. Binney before the Manchester (Eng.) Literary and Philosophical Society, they have also an important sanitary utility. He contends that the atmosphere of towns may be "sensibly ozonized and improved in quality" by their action. He says: "A water fountain may be regarded as a hydro-electric machine, the friction of the water issuing through the jets developing electric action, materially assisted by the conversion of the spray into aqueous vapor. I would suggest that this fact should be prominently brought before municipal bodies, to induce them to erect fountains in all available places in large cities as sanitary agents. They might prove highly beneficial in crowded localities." The subject of ozone, in its various phases, is engaging the attention of many scientific inquirers.

**FASTENING INDIA RUBBER ON METALS.**—A mastic for fastening India rubber on metals may be obtained by steeping gum-lac, in the form of pulverized scales, in 10 times its weight of concentrated ammonia. A transparent mass is thus formed, which, at the end of three or four weeks, becomes fluid without the use of warm water. This substance, applied on India rubber, becomes hard, and completely impervious to liquids and gases.

**AT YOUR OWN RISK ON THE TRACKS.**—The Supreme Court of Michigan decides that railroad companies are not responsible in damages for injury to persons voluntarily exposing themselves to danger by walking on the track. In such a case the negligence of the person injured contributes to the injury, and the court should instruct the jury that the plaintiff is not entitled to recover.

**GUM TREES IN JAMAICA.**—The eucalyptus globules planted in Jamaica some six years ago, have acclimatized themselves so thoroughly on the plateaus of this island that many have attained a height of 60 feet, with a trunk of one foot diameter near the earth. They do not prosper in the low lands of the island.

## GOOD HEALTH.

## Reliable Remedy for Ringworm.

**EDITORS PRESS:**—Several children in this neighborhood have been troubled this season with that curious and unsightly tetter known as "ringworm." Probably what is common in Monterey is common throughout the State, only "rather more so," as our climate is exceptionally salubrious. I judge, therefore, many of your readers may be glad to hear of a simple, effective remedy for the above disease. Take a piece of bluestone (sulphate of copper), and having wetted it in water, gently touch the whole of the affected surface, being careful to circumscribe the outer circumference. One application will probably be sufficient.

If the scalp is the seat of the disorder applications of strong vinegar, as hot as it can be borne, twice or thrice daily, may be preferable to the bluestone. Unctions dressings are worse than useless. EDWARD BERTICK.

Monterey, Cal.

## How to Treat and Avoid Diphtheria.

The State Board of Health has issued a timely address to the people of the State on the continued prevalence of diphtheria in the State, and an apparent increase in some localities, and calls attention to precautionary measures. When diphtheria appears in a family, precautions commonly taken to prevent communication of the sick with the well should be adopted. A person being attacked with the disease, access to the room should be prohibited to all except those in the capacity of nurses. Other children should not be allowed to visit the house, and the same rule might be judiciously applied to adults. The room of the patient should be well ventilated. All woolen clothes, curtains, and where practicable, carpets should be removed therefrom. The saliva and expectoration of the sick should be kept disinfected by requiring the vessels used to receive them, to contain a little of one of the disinfectant solutions. The clothes removed from the body of the patient, as well as the bed linen, when changed, should be immediately dipped in boiling water, to which should be added to every gallon one ounce of the sulphate of zinc, or half an ounce of chloride of

zinc or condis fluid. Chloride of lime, sulphate of iron and common copperas are objectionable, as the former, if used of sufficient strength, will injure the fabric, and the latter will stain it. The funerals of those dying of this disease should not be attended by children. There is reason to believe that diphtheria may be communicated in the school room, the liability being increased by the fact that the disease may not be at once recognized by parents, who consequently exercise no restraint upon the attendance of their children. There cannot be too much caution used to avoid this too common method of disseminating this and other infectious diseases. After convalescence the child should be kept from the school until it attendance is considered safe by the physician. Cleanliness in and about dwellings; drawing off or providing a suitable receptacle for the waste water, slops, and accumulations in the kitchen; the cleaning and disinfection of cesspools, sewers and privies; and where drains into these lead from the interior of houses, the provision of a suitable trap, preventing the entrance of sewer gas, is of first importance, as the traps in use are often insecure, and we cannot too strongly urge the necessity of close attention to this subject. In addition to the trap the connection of a ventilating tube with the soil pipe, extending above the roof of the house, would afford yet greater security. Disinfection in such cases may be cheaply effected by the free use of sulphate of iron, copperas, or by chloride of lime. In towns which rely upon wells for drinking and culinary purposes, care should be taken to avoid their contamination by contiguous cesspools and other filth deposits. When diphtheria is suspected in a member of the family, send for the family physician, and under no circumstances rely upon the various nostrums or specifics so often published in the newspapers, or recommended by kind-hearted and ignorant advisers.

## A Peculiar Case of Lead Poisoning.

We learn from the *Medical Record* that a popular district of Paris has lately suffered from an epidemic of lead poisoning which presents some noteworthy features. Dr. Ducamp has had 65 of these cases under observation, and he made them the subject of a paper read before the *Société de Médecine Publique* on July 25th. The patients belonged to all classes of the population; in some families all the members, both old and young, were affected. After careful investigation, Dr. Ducamp found that all his patients were served from the same bakery, and, as he could positively exclude all other methods by which the poison could be introduced into the system, he came to the conclusion that the bread was the agent morbid. Chemical examination showed that it contained lead; it was evident, however, from the character of the baker, and from the fact that he and all his family were among the most severely affected victims, that the lead was not placed in the bread with criminal motives, while, on the other hand, the fact that the water and flour were the same as were used by the neighboring bakers, whose bread was not poisoned, showed that these substances were not toxic. Dr. Ducamp finally ascertained that the baker had been using old wood taken from demolished buildings to heat his ovens, and here he struck the root of the trouble. This wood had been repeatedly painted with white lead, and when it was consumed by the fire an oxide of lead was formed, which was deposited in a pulverized form on the floor of the oven. When the embers were withdrawn, and the bread put into the oven, the oxide of lead probably adhered to the bottom of the latter, and was removed with it. The correctness of this theory was confirmed by two striking facts: The persons whose duty it was to brush the bread, and who must have detached a portion of the lead and inhaled it in the form of dust, were the first to be affected and had the most severe attacks. Again, in one family there were two women, of whom one ate only the soft part of the bread while the other ate the crusts. The former escaped entirely, but the latter was attacked so severely that her life was in danger.

**THE NERVOUS PERSON.**—A writer in the *Journal of Chemistry* holds out some hope to nervous people who will make the effort. The nervous ones, made so by physical defects, contrive to secure a considerable amount of happiness and largely to influence the world for good. This is accomplished by a will power which in a measure dominates over bodily imperfections. This power can be cultivated and strengthened, and every nervous sufferer should strive to gain it and never yield to despair. Fight out your destiny, rise superior to your weakness; this is the text from which sermons cannot be too often preached. A nervous person exists in the world under great disadvantages. It is like being compelled to play a perfect tune with an imperfect instrument or to row a boat against wind and tide. Life is fitful, capricious and every step uncertain. One may be progressing pretty fairly to-day, but to-morrow the nervous currents are reversed and thick darkness rests upon everything. This is applicable only to the intense forms of nervousness, such as are often met with. There is hope for even these; not that congenital infirmities affecting the mind can be wholly restored, that is not to be expected, but by clearly comprehending the situation, exercising the will power and taking the best possible care of the imperfect body, life may be rendered, in a large measure, comfortable and useful.

## The Week.

The week has brought the "best rain of the season" in many parts. On the mountains the snow has fallen, and the crests which have been well high bare for nearly a year and a half, will soon, we trust, acquire a depth of covering which will yield abundant water for the streams and ditches during the year to come. Although the season is not yet far enough advanced to determine its several characters, the impression is that it will be a wet one. The hydraulic miners are all ready for active work, and in many places are actively washing down the banks. The sluices, flumes and ditches have all been repaired and put in order for the winter's work, and now that the water has come in abundance, the miners will begin to reap their harvests and repay themselves for many weary days of hard labor and "dead work." A good wet season will set California "on its legs again," and we are happy to believe that the signs point that way.

The *Coso Mining News*, a valuable exchange which pays careful and intelligent attention to the local mining interests of Inyo county, has entered its third volume.

The Leopard mine produced \$18,584 in October, the net yield being \$16,735.

The Grand Prize mine produced in October \$117,444, the net yield being \$105,689.

## The Engines for the California Street Wire Railroad.

The California Street Hill Wire Rope railroad, to be operated on the same general principle as the Clay Street Hill railroad, will shortly be in operation, the machinery for working it being nearly completed. The engines will be placed at the corner of Larkin and California streets, for operating the endless wire rope by which the cars are moved.

We had an opportunity of examining this week, at the Hope Iron Works, on the Potrero, the engines for this work. They are very heavy and strong and made in the best manner. The engines are upright inverted engines, with cylinders 22 inches in diameter and 30-inch stroke. They are calculated to work at about 90 revolutions per minute, and can be worked up to 250-horse power. There is a pair of these engines, so that either one or both may be used, and in case of damage to one the other is fully capable of doing all the work. Piston valves are used which have separate chests for steam and exhaust. The valve motion is operated by stationary link. The governor is attached directly to the steam valve rod and varies the point of cut-off according to the duty required. The Porter governor is used and is so arranged as to apply to either or both engines.

The bed plate for each engine is cast separate, and they are bolted together; on them stand the columns which support the cylinders. The bed plates weigh about six tons each and the frames for each engine also weigh six tons. The cylinders and steam chests weigh about four tons for each engine. The shafts weigh a ton and a half a piece. The crank disks weigh four tons each and are six feet in diameter. The fly wheels weigh six tons each, and are nine feet in diameter. The two driving pinions on the engine shaft weigh two and a half tons each. They are four and a half feet in diameter, eighteen and a half inch face, and three and a half inch pitch. The engine shaft is nine and a half inches in diameter.

The engines have all brass bearings, there being about a ton of the best quality of brass castings in the two engines. All complete, the engines weigh combined upwards of 60 tons.

They are to be placed in an excavation under the sidewalk at the corner of Larkin street, and the main shaft will extend out to the middle of California street, where the main driving gears are in line with the center of the railroad track. This obviates the necessity of bringing the wire cable at right angles from its general line. The whole arrangement is under the charge of Henry Root, who is the chief engineer of the road. Mr. Hanscom has done all the work on the engines at the Hope Iron Works, except the heavy shafting, which was made at the railroad shops at Sacramento. The foundry has been engaged entirely on this work for about five months past. The wrought-iron work on the road was done by the Pacific Rolling Mills, and McAfee & Spiers built the three boilers (locomotive style) which are now being put in place.

The engines stand 12 feet high. The bed-plates will be 20 feet below the sidewalk, and are to be set in brick and cement. The engines are plainly made, with no extra finish, the valve gear alone being highly finished. They will be entirely completed in about three weeks.

## An Unjust Rule.

In ordinary business transactions, and according to strict law, if a person pays a sum of money to another and afterwards changes his mind about the disposition he originally intended to make of it, the person to whom the money is paid is held to be a depositary in trust and is bound to return the money to the depositor on demand, or dispose of it in accordance with his order, upon the proper indemnification of the depositor for the trouble and losses, if any, which he has sustained by such change of determination. The person, who in the absence of a specific contract to that effect, should attempt to retain, as a forfeit, money paid to him, because the depositor had changed his mind, in regard to the particular use he wished to apply it to, could be compelled by law to return it to the payer. Nevertheless, while this is the law for the people, it seems that our Patent Office officials do not recognize it as being applicable to Patent Office proceedings. By the office rule if an inventor pays into the United States Treasury the first Government fee, amounting to \$15, to be applied on an application for a patent on a specific invention, and either, through inability to proceed further, or because he discovers that his invention is old or not practicable, or if he fails to proceed further for any other reason, the office refuses to return him either the whole or any portion of the money. It does not even give him the Jew's privilege of "taking it out in trade" by applying it on a subsequent application. Whether this forfeiture of an inventor's money is regarded by the office in the light of a punishment or as a lesson for his future benefit we do not know. We do know, however, that the rule is an unjust one, and works a great hardship to inventors. We know of a number of instances where parties have, through ignorance, deposited the first Government fee, under the impression that they were thus pro-

tected, while they tested their inventions. If the final result of their experiments should not be satisfactory, their money is forfeited and cannot by any means be recovered or applied on a subsequent case, although the Government has returned them no equivalent therefor. This looks very much like what we call a "gouge game." It certainly is contrary to the law that money paid without a consideration therefor, can be recovered.

## Another Dry Placer Machine.

During the past month we have referred to two different machines applicable to working dry diggings, and this week we saw still another, apparently simpler than either of those before spoken of. The one in question is the invention of J. C. McCurdy, an old Montana miner, who has it in operation in a blacksmith shop on Jessie street, between New Montgomery and Second streets, at the rear of the Grand hotel.

The machine is about the size of an ordinary ore feeder, but narrower, and is made so as to be taken apart for transportation on mules. It weighs altogether about 500 pounds, and is operated by crank motion, one man being able to run it easily. The dirt is fed on an inclined screen which separates the larger particles, the finer falling on to an inclined table about 20 inches wide by four feet long. This table is covered with sheet iron. When the dirt falls on the upper end of the table it passes under a kind of agitator or stirrer, which consists of a square board with spikes two and one-fourth inches long, passing through it from above. The points of these spikes rest on the table, and the lateral motion imparted to the board has the effect of stirring up and disintegrating the lumps of dirt. Passing under and through these spikes the dirt then comes to five mullers. These are composed of half oval bars of iron flat on the under side and pointed at the upper end, which fit snugly to the bed or table. They lie lengthwise the table, and a lateral motion is imparted to them the same as to the board and spikes. They keep the material loose and broken so that the heavy and fine particles settle to the bottom. The lower ends of these mullers have upright iron spikes projecting upwards to clear the debris and assist in discharging it over the end of the machine at the riffle.

The table itself is hung at each corner on galvanized iron wire cord, and the revolution of the crank imparts to it a forward and back shaking motion, while the mullers and spikes have only a lateral motion. It is intended as far as possible to imitate the motion of a miner's pan. A simple arrangement admits of regulating the inclination of the table as desired. At the lower end of the table a tail-board is placed which forms a riffle, and the space between the table and tail-board allows the concentrated earth to pass back under the machine to the ground, while the debris goes over the end of the machine.

One of these machines made in a rude manner was tested practically in Montana, entirely to the inventor's satisfaction, and he has come here for the purpose of introducing them where he has the facilities for cheap manufacture. There is very little cast iron work about the whole thing, the idea having been kept prominently in view to make it as simple as possible, and put nothing on which could not be repaired by any ordinary blacksmith. The only casting used is the gear wheel on the crank shaft. It can be used advantageously not only in dry diggings, but where there is say two and one-half inches of water, in which case the inventor says it will do as much work as 70 inches will in sluices. By using this small amount of water a slight modification is necessary, but the owner can clean up every night.

In working dry dirt the idea is to concentrate say 100 yards into one, and then pack the one off to water and wash it. If necessary this can be put through again and re-concentrated to still less bulk before washing. The machine will work, dry, in a day, about what one man would shovel, or more according to the size of the machine.

They are to be made with bed plates from 16 to 30 inches wide, and will be sold at from \$400 or less, according to size and capacity. While we examined the machine the inventor passed through it a quantity of talc slate, dirt and rock, containing a few small flattened shot. The fine material and shot settled to the bottom before reaching the end of the plate, and fell back under the machine through the aperture, while the coarser part passed over. The machine is hauled, like all concentrators, on the principles of specific gravity, and the dirt is simply kept loose so that the fine and heavy material can settle down as the whole passes through. The power required to run the machine with a 20-inch bed plate is no more than a man would expend in shoveling all day. Those interested in this class of machines will do well to examine it in operation at the place indicated above, or the inventor can be addressed at the drug store, N. W. corner Second and Howard streets. Many places in California, Arizona, New Mexico, Sonora and elsewhere could be made to pay handsomely with a machine of this character, which have been heretofore untouched on account of a lack of water. Mr. McCurdy has spent considerable time in perfecting this machine and has delayed introducing it until he had practically tested its merits to his satisfaction.

## The White Patent Furnace.

A decision involving the title to one-fourth interest in the White patent rotary furnace was recently made by Judge Wheeler in the Nineteenth District Court. This White patent furnace is the original inclined revolving cylinder furnace, patented in 1864-5; being continuous in its operation, and is rapidly growing in favor for roasting and chloridizing silver ores, and on this account a number of spurious imitations have at different times since the patents were issued, been attempted to be introduced, but all embracing its main features, which are essential for the successful treatment of the ores.

It is on account of the importance and value of this furnace to the mining public that we make known the facts concerning the title to the patents. The action was brought by James M. Thompson against George W. White to compel White to convey a one-fourth interest in the patent for said furnace, and decided by Judge Wheeler in favor of the plaintiff.

On Feb. 13th, 1875, Thompson agreed to loan White \$1,000 to aid in erecting a furnace in this city, for which White agreed to give his notes and to pay them at the end of 16 months. Should Thompson not elect to purchase one-quarter interest in the patents then the \$1,000 to be loaned was to apply as a payment on the purchase of the interest at \$5,000, the balance of \$4,000 to be paid out of the first profits of the interest for two years, or until they reach that amount. The facts brought out by the evidence, at the trial of the case, showed that White purposely kept out of the way when Thompson was looking for him to tender his notes and demand his conveyance of the interest, and that he had, from the first, intended, if possible, to avoid making the conveyance to Thompson.

The decision which has the effect of vesting in Thompson one-fourth interest in the entire furnace patents, is a favorable one for the mining public, for with the important improvements which he has made in the furnace, as well as also its improved mechanical construction, as made at the Pacific Iron Works in this city; the defects in the furnace, as heretofore constructed by White, are entirely overcome, and its action is very much improved, as well as its capacity and economy of operation greatly increased, and it is probable that the furnace, as constructed at the Pacific Iron Works, under Thompson's license will constantly grow in favor, as its merits over other roasting furnaces of this description become more generally known.

A peculiar feature of the patent law, which we have frequently stated before (see John L. Boone's articles on patents and patent law), and which we will again make known for the benefit of our readers, was referred to by the learned Judge in giving his decision of the case. This is, that joint owners of patent rights are not necessarily partners, and that each of them, no matter how great or how small his interest, has the right to act independently of, and without accounting to the other owners, and that purchasers of patent articles from a joint owner of however great or small an interest in the patent, have as full right to the same as purchasers from exclusive owners of an entire patent would have.

The Judge, in reviewing the case, said men who advance money to inventors assume great risks, and have some rights. Thompson came forward with his \$1,000 and assisted White in an invention that he (White) had been working on for 11 years. He took the risk and had a right to share in the profits. The defendant contended further that it would be unjust to convey a fourth interest, as a man might as well own nine-tenths as one-fourth, because with any interest whatever he could proceed with the manufacture and sale of the furnaces. The court observed that counsel had replied with great mathematical precision to this objection by holding "if one-fourth is equal to the whole, three-fourths is not less than the whole." The court found in the evidence that this objection had no force, as a man in New York was also owner of a fourth interest, and concluded by saying: "Thompson's claim is meritorious both in law and equity, and the decree is in favor of the plaintiff."

COMSTOCK BULLION.—According to a statement made to the Assessor, the quantity of ore and gross value of the bullion produced in Storey county, Nevada, for the quarter ending September 30th were as follows:

Mines.	Tons.	Average.	Bullion.
Andes.....	936	\$15	\$14,000
Belcher.....	2,685	24	64,000
California.....	55,180	75	4,337,200
Con. Virginia.....	49,681	106	5,223,200
Chollar-Potosi.....	5,282	15	\$1,800
Justice.....	34,285	17	598,200
Ophir.....	1,407	21	31,100
Stevenson C. C.....	3,967	13	55,300
Totals.....	\$147,459	\$64	\$9,505,000

The Silver King mine of Arizona, has been listed at the S. F. Stock and Exchange Board. Other Arizona mines will soon be called in the same board.

The Manhattan mines have paid \$400,000 in dividends, without the levy of a single assessment.

## HYDRAULIC MINING IN CALIFORNIA.\*

No. 6

(By A. C. J. BOWIE, JR., A. B., Mining Engineer.)

## Flumes and their Construction.

In crossing ravines, flumes or wrought iron pipes are used. Many miners object to flumes on account of their continual cost and danger of destruction by fire. Where used, and practicable, they are set on heavier grades than ditches, 30 to 35 feet per mile, and, consequently, are proportionately of smaller area than the ditches. In their construction a straight line is the most desirable. Curves, where required, should be carefully set, so that the flume may discharge its maximum quantity. Many ditches in California have miles of fluming. The annexed

one of better make on which the round seams are made with rivets three-quarters of an inch apart, and the longitudinal seams are double riveted with rivets one inch apart in the row, and with about one-half inch apart from one row to the other. If riveted with care such pipes, after being dipped in an asphaltum bath, are excellent and will last for many years. For the asphaltum bath the following preparation can be used:

Crude asphaltum..... 25.  
Coal tar (free from oily substances)..... 72.  
Or,  
Refined asphaltum..... 164.  
Coal tar (free from oily substances)..... 83.

When the mass has been boiled to a proper consistency, and by test the coating is found to be brittle, it at once indicates that the mixture

The following table shows the usual distances of rivets for corresponding thickness of iron; items relate to 22-inch wrought-iron pipe:

Thickness of the iron	Diameter of the rivets	Length of the rivets	Pitch of the rivets	No. of rivets in each circle seam.	Pitch of the rivets in the longitudinal seams or double row.	Width between the centers of the rivets in the double row.
No. 12 5-16 in	5/8 in	1 in	1 in	60	1 1/2 in	1 1/2 in
No. 11 5-16 in	5/8 in	1 in	1 in	60	1 1/2 in	1 1/2 in
No. 9 3-16 in	3/4 in	1 1/2 in	1 1/2 in	60	1 7-16 in full	1 1-16 in
No. 8 1/2 in	3/4 in	1 1/2 in	1 7-16 in	39	1 11-16 in full	1 1-16 in
No. 7 1/2 in	3/4 in	1 1/2 in	1 7-16 in	39	1 11-16 in full	1 1-16 in

## Reducing Ores.

Quite a remarkable fact seems to have become apparent lately in the reduction of gold bearing quartz, namely: That a process which acts admirably with a small quantity of rock, will not give proportionate results with a large quantity. There is more than a rumor afloat that the Monnier process at the Providence mine is somewhat of a failure in its present stage of development, though what may be attained in the future may far exceed the highest anticipations of its intelligent inventor. And this supposition is confirmed by the report that a large sized stamp mill is to be erected on the site of the present hoisting works. Yet this process worked exceedingly well with a small quantity of quartz, and so confident were the proprietors of the Providence of its complete success, that they invested thousands on thousands in adapting it for the reduction of their ore. What the cause of the failure is, cannot be accurately ascertained at present. It is possible it may be in the direction of the chemical law of equivalents; it being far more difficult to accurately weigh and combine large quantities of rock and the necessary chemicals, than small quantities of the same. But whatever the cause, the fact stubbornly remains, and must of necessity be considered, especially in all attempts at the reduction of obstinate ores. We see that some enterprising man has, in his own opinion, discovered a process for the successful reduction of the rock of the Meadow Lake mines, and reasons that because a small quantity has been well worked by the process, therefore, as a matter of course, a large quantity can be just as well worked. May there not be room for a great mistake here, and would it not be well before going to great expense in the erection of works to be certain of the efficacy of the method in regard to a comparatively large portion of rock? Perhaps it is in this as in chicken raising. A small number of chickens or hens will do first rate, and grow and lay well, but if the experiment be tried with a very large number, it signifies little; or as an author may find that an article, poem or address will sound very well before a small company of friends, and he received by them with much applause and commendation, which, before a large miscellaneous audience, would fall dead and meet only with hisses and contempt. It is possible that there is a law which necessarily prevents enormous success in the generality of mining enterprises as well as in other matters, and that it is better for us that slower and more laborious methods be adopted. It is certain that we need more of the cool, plodding perseverance exhibited in the business of mining in the old countries, before our mines are developed to the extent, and with the thoroughness that they should be.—*Nevada Transcript*.

## Mining Enterprises in Oregon.

A correspondent of the *Oregonian*, speaking of enterprises in eastern Oregon, says: If the rains hold off for two or three weeks more, several of the mining ditches, in course of construction, will be completed to the gravel deposits and ready to commence operations. The Sterling ditch, under the energetic management of Gov. D. P. Thompson, is rapidly nearing completion. The construction of the flumes along the line is all that remains unfinished, the lum is being floated down the ditch as rapidly as possible to complete this part of the work. Men are engaged making and laying the pipes and constructing the water distributor above the ground where the piping will be commenced. Since my last communication to the *Oregonian* another extensive ditch has been commenced on Big Applegate creek, 25 miles south of Sterling. Dr. J. C. Hawthorne and Judge J. H. Reed, of your city, are interested in this work, and the ground it is proposed to mine is reputed to be rich and extensive. About two weeks ago Gov. Thompson turned over 200 Chinamen to the new company, their labor not being required longer by the Sterling company. This work is now being pushed forward with all possible dispatch, in order, if possible, to attain completion before the rainy season sets in. Judge Tolman is pushing the work forward with great energy on his Cow creek ditch. He has already reached the first gravel deposit on his line, from the head of the ditch, and will heready to commence mining as soon as his pipes, flumes and other apparatus are on the ground. The mining companies of Josephine county are all in readiness for water, and if the coming winter brings the usual supply, there is a very flattering promise of better times throughout this part of the State. Indeed, if the mining enterprises now inaugurated in Jackson, Josephine and Douglas counties prove successful, they will but introduce an era of prosperity that will last for many years. There are many other localities where vast deposits of gravel are found which yield paying prospects and require only capital—to bring in water—to be made to pay large dividends to shareholders. The prospect for the "good time coming," foreshadowed by the development of the mines, affords a more cheerful outlook to all classes of people.

A NEW MILL.—Jurien Scott and Peter Spray are having a five-stamp mill erected on their mine in Indian district, six or eight miles south of Unionville. All the castings and the greater part of the machinery of the mill were made at the Mill City foundry.

## Beet Sugar in California.

While the beet sugar industry is showing decreased production this year in France, owing to a season unfavorable to the growth of the material, it is gratifying to know that one of the California factories is going forward with its business rapidly and distributing considerable sums of money to the beet growers. The factory at Soquel, Santa Cruz county, is running to its full capacity, and we are glad to get from the *Santa Cruz Courier* some interesting statements concerning it. The sugar company only cultivated 100 acres of beets themselves this year, gathering therefrom 1,000 tons of the roots. Charles Knapp, of Watsonville, had the contract for furnishing the 5,000 tons of beets, which were raised in the Pajaro valley, for the factory. The land in that valley seems especially adapted to this culture, in some cases yielding as high as 25 tons to the acre and averaging 20 all round. At \$4.75 per ton—the price paid the cultivators—the average return from the land in this crop was \$95 per acre. The year's work will throw \$25,000 into the Pajaro valley on this crop alone. As the rainy season is coming on, the factory is rushing in two train loads, of 20 cars each, of beets every day, the surplus over the amount necessary to run the factory each day, 13 car loads, being piled alongside the switch for future use. Mr. Hihn, has the contract for furnishing the wood for the establishment—3,500 cords per year at \$3 per cord. Dr. Flint is keeping 300 head of cattle in the immediate vicinity of the works, to which is fed the pulp left of the beets after the saccharine has been extracted. Next year either Dr. Flint, or the sugar company will probably run a dairy for the purpose of turning this pulp to the best advantage. The market for the beet sugar this year is as good as the average. The mill is running at full capacity, and will not shut down until after the first of January. It is now turning out about 70 cents or three and one-half tons daily, nearly all of which is shipped to San Francisco. Directly and indirectly, about 160 men obtain employment through the running of this establishment, and about \$75,000 a year is paid out in this county by it. The company has \$250,000 invested, which pays a good dividend. Another vacuum pan will be added to the factory this winter for the next year's run.

THE NEQUILLA MINE.—The Arizona *Citizen* announces the conditional sale of the Nequilla mine, near Tucson, to San Francisco parties—Clinton Gurnee, Esq., being the negotiator. The property belongs to Messrs. W. F. Scott and James Lee, and was the first mine for which a United States patent was obtained in Arizona. In a straight line it is perhaps not above 12 miles from town, and by a very fair road, about 15. About five years ago work was suspended on the mine. The last done was that of sending several tons of the ore to San Francisco for reduction, which, if we rightly remember, gave a net yield to the shippers of about \$90 to the ton. The vein is opened up to a depth of 120 feet. It seems to be a clearly defined lode, varying in width from one to five or six feet. There are springs of water near the mine, and a passable wagon road to it. The price to be paid for the mine is \$20,000 if the sale is finally perfected, a fact dependent upon its development.

RICH MINES NEAR IONE.—J. B. Cooper, one of the owners of the series of mines situated about eight miles south of Ione, Nye county, recently purchased by a party of San Francisco capitalists and now being worked under the superintendence of M. San Pedro, arrived in town yesterday from the mines and left on the Battle Mountain stage, en route for San Francisco. He had with him a large bar of silver, the product of a comparatively small quantity of ore from the mines. He stated that the mines are emphatically a big thing, the ledge being eight feet in width, of free milling ore. Ten men are now employed in developing the mines and taking out ore, the work so far done on the mines being merely superficial, but enough to demonstrate that their prospects are big.—*Reese River Reveille*.

RICH discoveries are being made, almost daily, in the locality about three miles westerly from the Silver King. Within the last month several rich discoveries have been made about three miles east of Mineral creek and about 10 miles north of the Gila river. The principal mines in that locality are the Monitor and the Great Republic, which have ledges from four to six feet in width, the ore assaying all the way from \$300 to \$700 to the ton. Both these claims are being rapidly developed. C. G. Mason, of King notoriety, is an owner in the Great Republic, and is pushing the work on the mine with his accustomed energy and determination.—*Arizona Citizen*.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and the subscribers against the acts and mistakes of others.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick-silver. 1876.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

## UNITED STATES Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that No Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

## Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patches process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, beat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroehne's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two of three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansome Street, San Francisco.

## OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send done but worthy men.

J. L. TULAR—San Francisco.

B. W. CROWLEY—California.

A. C. KNOX—Pacific Coast.

C. N. WEST—Santa Cruz, Monterey and San Benito counties.

A. C. CHAMBERLAIN—Tulare, Fresno and Inyo counties.

JOSEPH DIMMICK—Mendocino, Humboldt and Del Norte counties, and Oregon.

W. D. WHITE—San Bernardino and Los Angeles counties.

J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.

B. E. LIOTT—Alameda, Contra Costa and Napa counties.

E. M. DENNY, Oregon.

F. B. ALDERSON, Nevada.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly.

The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure.

Single samples will be mailed from this office for 50 cents, postpaid. Wholesale and retail agents wanted.

## Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

Map of California and Nevada; The Public Lands; The Land Districts; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.

Instructions of the U. S. Land Commissioners.—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College; Serp; Pre-emption; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissions; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

Abstract from the U. S. Statutes.—The Law Concerning Pre-emption; Concerning Homesteads; Amendment Act Concerning Timber; Miscellaneous Provisions; Additional Surveys; Land for Pre-emption; List of California Post Offices. Price, post paid, 50 cts.

Published and sold by DEWEY & CO., S. F.

Thanks for Prompt Attention.

STOCKTON, June 26th, 1875.

Messrs. Dewey & Co., S. F.:

I have received the patent for my invention in wagon brakes, which you prosecuted for me; patented May 11th, 1875—No. 163,046. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific coast to give you a call, which I think they will never have any cause to regret. Very truly yours, GEO. G. BUCKLAND.

## SCRIBNER'S LUMBER and LOG-BOOK OVER HALF A MILLION SOLD.

Most complete book of its kind ever published. Gives correct measurement of all kinds of lumber, logs and plank by Doyle's rule, cubical contents of square and round timber, stave and heading bolt tables, wages, rent, board, capacity of cisterns, cord-wood tables, interest, etc. Standard book throughout United States and Canada. Ask your bookseller for it, or I will send one for 35 cents, post-paid. G. W. FISHER, P. O. Box 258, Rochester, N. Y.

SOLD ON THE PACIFIC COAST BY

DEWEY & CO., San Francisco,

And mailed post-paid on receipt of 35 cents in currency or postage stamps.

## Peerless Corn Sheller.

It is so cheap (costing only \$9), that almost any one can afford to buy one. It is so rapid, it will shell almost as fast as a \$40 machine, and seven or eight bushels per hour is not above its capacity. It weighs only 13 pounds and is simple and durable. For particulars, address

WEISTER & CO.

## To Mill and Mine Owners.

Having made arrangements with competent and re-  
 liable parties in Washington City, by which we will be  
 able to secure prompt and careful attention to our busi-  
 ness, we are now prepared to assist Mill and Mine, Canal  
 and Ditch owners in securing patents for their lands,  
 mines and claims, in addition to our former line of patent  
 business.

Many who are acquainted with the manner in which  
 this business has heretofore been conducted, (with or  
 without assistance by local attorneys,) will see at once  
 the great advantage of patronizing an establishment that  
 is thoroughly organized and has its representatives in  
 Washington to look after and prosecute their applications  
 before the Commissioner of the General Land Office.  
 The business on this Coast will be attended to by JOHN  
 L. BOONE, Esq., Attorney-at-Law, one of the mem-  
 bers of this firm.

Correspondence from persons desirous of securing  
 patents for Lands, Mines, Mill Sites, Canal and Ditch  
 property, promptly attended to.

**DEWEY & CO..**

Solicitors of Patents for Lands, Mines and Inventions,  
 MINING AND SCIENTIFIC PRESS OFFICE,  
 No. 202 Sansome St., S. F.

We have the best Imitation Gold Watch in the Market for Trading  
 Purposes. The metal is a composition of other metals, so cleverly resem-  
 bling gold that the best judges find it difficult to detect the difference, except by a  
 chemical test, and it has the virtues re-  
 quisite to make it the best substitute  
 for gold known. GENUINE AMERI-  
 CAN MOVEMENT. EXPANSION BAL-  
 ANCE. BEAUTIFULLY ENGRAVED OR  
 ENGINE TURNED HUNTING CASES,  
 and equal in appearance to a GOLD  
 WATCH THAT COSTS FROM  
 \$150 to \$200. It sells and trades  
 readily, for from \$50 to \$100, and if you  
 wish a watch for your own use or to make  
 money on, try this. Owing to our large  
 sales, we are enabled to reduce the price  
 of them to \$12 each with an ele-  
 vant chain attached. They are used on  
 Railroads, Steamers, and in Manufactories,  
 and other places where accurate time is required,  
 and gives general satisfaction. We send them  
 by Mail or Express, on receipt of \$12, to any  
 part of the Country, or it will be sent C.O.D.  
 when the customer desires and remits \$2 on ac-  
 count. These Elegant CHAINS weigh about  
 Fifty Pennyweights, and the same pattern in  
 pure gold would cost \$100. We sell these Chains  
 at \$5 each. But we sell the Watch and Chain for  
 \$15, sent by Mail in a Registered Package, post-  
 paid, to any Post Office in the United States.

WE SELL THE WATCH WITHOUT THE CHAIN FOR \$10.

## EDUCATIONAL.

**THE BERKELEY GYMNASIUM.**

A PREPARATORY

SCHOOL TO THE UNIVERSITY.

THE FIRST TERM WILL COMMENCE  
 Wednesday, August 1, 1877, and close Thurs-  
 day, December 20, 1877.

THE SECOND TERM WILL COMMENCE  
 Wednesday, January 9, 1878, and close  
 Thursday, May 30, 1878.

The location of this Institution for health, has no supe-  
 rior. Its proximity and relationship to the State Uni-  
 versity give it many advantages that no other school on  
 the Pacific Coast can command. Our first aim is to secure  
 to every student in our charge such accommodations as  
 will make him

**Comfortable and Contented.**

Devoted to but one well defined work, we are gathering  
 around us the youth of loftier minds and purer aspira-  
 tions; such as are seeking a higher education. We are  
 protected, naturally, from that class of students who  
 are sent to school to escape the House of Correction.  
 The Principal and Faculty respectfully solicit a fair in-  
 vestigation from intelligent parents and earnest students.

 Outfit 10c. CLINTON BROS., Clintonville, Conn.

Continued from Page 309.

followed to the tenth, and thence downward a further distance of 100 feet, is still apparently limitless in depth, and of immense proportions both in width and length. The bottom of the winze from the tenth level has attained a depth of 100 feet, and is still in ore. It is probable that a new level will be opened up at some future time, but at present the reserves in the upper levels are so vast that no necessity exists for that work. It is also probable that some radical changes in the present system of working will be inaugurated. Among the problems of the future, as the mines are explored to a greater depth, is the increased flow of water that will no doubt be encountered. With the exception of the K. K. Con., the Ruby Hill mines have not been troubled with this element in sufficient quantities to retard operations, but during the past week the influx into the Consolidated has been more than was ever before experienced, and its presence has proved an obstacle to the prosecution of prospecting. Ore extracting has progressed steadily since our last review, some 1,000 tons having been raised to the surface, the most of which has been transported to the reduction works. We are informed that the lower deposits—those on the tenth level—are a much higher grade than ever met with before. The ore is entirely free from any refractory elements, carries a high percentage of lead, and assays on an average very nearly \$100 per ton in gold and silver. This fact adds very materially to the value of the bullion, and is a most noteworthy feature.

**THIS JACKSON MINE.**—The following official letter gives a resume of operations at this mine. There is no change to be made in the drift on the 300-ft. level. The face is in soft line with bunches of low-grade ore interspersed through it. The drift south on the 400-ft. level is looking well; the ore seam still making in; made 21 feet since last report. Drift from winze is improving, as we advance. For the last two days the rock has got much softer. Since air pipes were put in the air is splendid, and we can carry the drift almost any distance. We are still raising some ore from the third slope in the ore winze. Started pumps yesterday, and both are working well. Pumped the sump dry in 15 minutes. Would have started shaft yesterday but was compelled to shut down to repair engine. Will be ready to start up this morning. Will put a three o'clock shift at work on the shaft. Do not anticipate any further trouble with the pumps.

### Arizona.

**DISCOVERY.**—*Arizona Enterprise*, Nov. 3: Al. Doyle and Dan Martin have made a discovery about a mile south of the Peerless, which gives promise of being a valuable piece of property. Some very rich ore is being taken out, and the vein is steadily widening. Work is about to commence on the Nifty, situated on the Hassayampa, near Frederick's mill. This is an old location, showing a strong and well-defined vein, and carrying some high grade ore—gold quartz.

We were shown, yesterday, some specimens from a late discovery south of the Davis mine in Hassayampa district. The ore is a sulphuret, and assays into the hundreds. The finder is Mr. Hauson.

**BULLION.**—The Peck company shipped this morning two bars of bullion, weighing 1,421.40 and 1,420 ounces, respectively, and valued at \$3,548.91. The total amount shipped by the company during the month of October will foot up to about \$30,000.

**TROUBLE AT THE MILL.**—Yesterday morning it was rumored that S. O. Frederick, of the Senator mill, had left for parts unknown, and subsequent investigation confirmed the fact. He was in town on Wednesday, when he brought in the week's clean-up from the mill, some \$2,000, which is about all he must have taken with him. He told Pat Hamilton and A. O. Noyes that he was going after shoes and dies for the mill, which he said were at Mr. Hitchcock's. He said he had been to the mill the day morning he could have been back by this time. From inquiries made we learn that his indebtedness will reach about \$100,000, a good part of which is due to the miners and mill men whom he had employed. C. P. Head & Co. are the heaviest losers, his indebtedness to them being something in the neighborhood of \$57,000. They have his note for \$23,915.00, on which they brought suit; and have also brought suit for the sum of \$84,596.80 for goods and merchandise sold to him. Bowers & Richards have a mortgage on the mill and other property for \$18,000. L. Bashford & Co. have brought suit for \$392.32. Several suits have been entered in Judge Carter's court.

**BRADSHAW.**—In the Bradshaw district the Tiger company are pushing down in a business-like manner, and evidently intend prospecting their mine thoroughly. They have comfortable and efficient hoisting works. There is nothing adventurous about the Tiger; they are laying the basis of a prosperity that will realize great fortunes. We learn that the Tiger mine is about to change hands. Arrangements are being made with the owners of ground adjoining the Discovery claim, with the view of purchasing their interests by the parties now operating on the mine.

**TIP-TOE.**—This tip-top is a lively camp. A shaft and three tunnels on each north and south hill are showing the mine rapidly and favorably, while the pay streak continues in richness and widens encouragingly. At the Foy mine very favorable chloride ore has been developed.

**GREENWOOD.**—By information received from Greenwood we learn that the Signal mill on the Sandy was ready to start up. On the trial run everything was found to work to perfection, and the company expected that the mill would commence running on Saturday. The capacity of the mill is 60 tons per day. The McCrackin company have the foundation for their new 20-stamp mill almost finished, and expect to have their mill in running order in about 60 or 70 days.

**PECK.**—The work on the new Peck mill is being pushed rapidly. Mortars, pans and settlers are in place, and in 30 days stamps will drop on ore from the Peck bonanza. The north tunnel of the Peck mine is in 60 feet beyond the south of the main shaft, showing on the face 20 inches of green ore, worth from \$300 to \$1,400 per ton. A shaft about 50 feet below the north tunnel is making good progress, and with a small force of men sufficient first-class ore is taken out to keep pack-trains running. On Saturday last a sufficient flow of water was obtained at the new mill for mill purposes.

On the May Bean (discovery) extension on the Peck a tunnel, under the able direction of R. J. Hubbard, is progressing rapidly, with the expectation of reaching the ore vein in a few weeks.

At the Black Warrior it is hard to tell who is doing the most work. Doc. Smith or the men in the shaft. The rapid work Doc. keeps picks and drills in shape and the energy he displays in sorting ore seems more like pleasure than labor. The ore, heavily impregnated with wire silver, is from their two feet wide, and indicates a vein as permanent as any in the country.

At the Doyle a contract has been let to sink a shaft to a depth of 100 feet, which is now down 50 feet, showing 8 to 14 inches of good metal, with good prospect of a healthy mine.

There are many good mines in the Peck district, on which work has been temporarily suspended, by reason of the owners doing assessment work on new locations in other districts.

**MCCRACKIN.**—*Arizona Miner*, Sept. 2: S. C. Miller returned on Saturday from the Big Sandy, where he, in connection with his brother, has large freighting contracts. The Signal mill company has a contract with the Miller Bros., extending over a period of 16 months, for the delivery of 10 tons of ore per day from their claim on the McCrackin lode to their mill on the Big Sandy, a distance of eight miles, for which they pay \$5 per ton, or an average of \$300. The Signal mill commenced operations on Saturday last, having on hand, at the dump of the mill, 300 tons of ore, while at the mine they have in sight several thousand tons in readiness to ship, therefore it will be easily conceived that this company have not only an excellent 10-stamp mill but they have also an abundance of ore wherewith to keep it busy. It is thought by those competent to judge that the Signal company will be able, at the least calculation, to ship \$30,000 per month from their works to the Mint in San Francisco, or about \$1,000,000 per annum. The McCrackin company, who are

now busy in the erection of a new 20-stamp mill, which will be completed in about 60 days and ready to commence its work of reducing the mountain ore discovered by Jackson McCrackin, from whom the mine derived its name, have also a contract with the Millers for the hauling of 100 tons of ore per day, commencing in about 60 days from the present time. Times on the Big Sandy are flourishing. New buildings are going up all along the Sandy for a distance of three miles, and the town has been appropriately named Scatterville.

### Idaho.

**WAGONTOWN.**—*Cor. Idaho Herald*, Sept. 2: The J. B. Dadds is yielding good ore in moderate quantities, being worked by Brunzell & Co. The Crown Prince, now owned and worked by Wilbur Harlan and Ryan, is turning out quantities of ore that is good for \$90 per ton. The ledge is six feet wide, the principal part of the metal being gold. Two men are "cayotting" about in the Henrietta mine, which turns out a very small quantity of as rich silver ore as can be found the accident which occurred some time ago. John mine also yields a small quantity of ore of the same character, and is being "cayotted" by two other miners. These two mines, together with the Maggie and Comstock, are situated in a small knoll between two main ridges, and their respective shafts form a little cluster within a radius of not more than 100 yards. The ore is found in spurs that shoot here and there through seams in the bedrock, and can only be successfully worked by men of experience in these particular mines. Silver is found in veins all over this hill and those on each side, but, as a general thing, in light quantities, the great mass yielding from \$35 down to \$12 per ton. There are thousands of tons of float rock on the surface that will yield from \$15 to \$40 per ton, and a number of men are engaged in gathering it, but it costs \$10 to haul and crush, and men cannot get rich gathering float. The ore from the Henrietta is worth from \$20 per ton to \$6 per pound, and cannot be worked by mill process here.

**OWTIE.**—Mining affairs in this county are wearing a more cheerful look than a year ago. The Poorman will start up shortly. The Potosi and Belle Peck and a number of smaller operations are being carried on successfully. The Black Jack mine, mention some time ago, has made a run of quite a number of tons of quartz that has paid well.

**SOUTH MOUNTAIN** is sure to revive sooner or later. There are some good ledges there of milling ore besides the large quantity of smelting ore known to exist in that mountain.

### Montana.

**THE DEXTER AND THE LEXINGTON.**—*Butte Miner*, Nov. 3: After being thoroughly repaired the Dexter mill was started up last Thursday, and has ever since been busy at work day and night. The accident which occurred some time ago to the Lexington is to be remedied by replacing the engine hitherto in use by a larger and more powerful one now on the way, and expected to reach Butte to-day or tomorrow. To set up the engine and make all the repairs required throughout, will take about two weeks, and after that date we may expect to see the Lexington working with its old-time regularity.

**MORE REMOVALS FROM VIBOND DISTRICT.**—We learn from Mr. Purvine that the milling facilities of the Vibond district will soon be largely increased, as two more arrastras and a five-stamp mill will shortly be added to the works now employed upon Vibond ore. Isaac Dodson will own the mill which he is now removing to Dewey's flat from the neighborhood of Radersburg. The arrastras will be owned, one by Allan Hay, the other by W. H. Brown. Mr. Hay's arrastra will be run by the engine of the Moose creek sawmill, which is soon to be brought to the flat, but Mr. Brown's will be a new one throughout. Both arrastras will be well provided with pans, settlers and all other appliances necessary in treating silver ore. The ditches to supply the water are already dug and it is expected that all three of the above works will be completed and ready for work long before spring.

### Coloma—The Site of Sutter's Mill.

Changed Conditions of a Historic Locality.

[Written for the PRESS.]

In no town along the great auriferous belt of California has the business of mining been so nearly extinguished as here at Coloma, the spot where gold was first discovered. Evidences of the former workings are, indeed, everywhere abundant, but not here, nor in the immediate vicinity, is gold gathering by any of its various methods now much engaged in. The great fields of cleau washed shingle, and the vast piles of glistening boulders seen on every band, attest how extensively gold washing was once been carried on; the young trees now growing in the deserted diggings denote how long a time has elapsed since this industry was actively prosecuted here. Instead of the old-time village, with its eager crowds and exciting scenes, Coloma is now a quiet, vine-embowered hamlet, with rustic homes and rural occupations. Almost every house is buried in a cloud of foliage, the thrifty and well-trained nurseries and shade trees standing like a forest about the place. Strangely, indeed, has everything in and about the town been changed. The historic mill is gone. The equally historic race, with the washing away of the bar through which it ran, has disappeared. The two tall pines that towered over the old structure, as shown in Nahl's famous picture, stand there no more. Only the hills around, with their scattered oaks and forests of pine, and the river rushing over its rocky bed, remain the same.

Sutter's Mill, Coloma, in the Month of March 1849.

It was the rudest sort of a camp, a score of log cabins and a few board shanties with some tents and Indian wickiups constituting the village proper. It was then a dull place, too, the population being made up of old 48ers, a class of men prone to take things easy and in no great haste to get rich. The most of them had gathered a good deal of gold dust the year before, but having done little the preceding winter, while the cost of living was great, the contents of their buckskin purses had, by this time, made their way pretty generally into the pockets of the local traders, the gamblers, too, very often coming in for a share. But then every man's credit was good, at least for all needed supplies of flour, beans, bacon, whisky, tobacco and like prime necessities. The inhabitants of the place were made up of American residents in California, including members of the Stephenson regiment, and of settlers from Oregon, with a sprinkling of sailors who had

left their ships in the port of San Francisco, adventurers from Mexico, Central and South America, Kanakas and such persons as happened to be sojourning in the country at the time of the gold discovery, the population of the camp amounting then to some 300 or 400. There were, at this date, several

Families Residing at the Mill.

Of these I remember James W. Marshall, the discoverer of gold, Peter Wimmer, and the Bennetts, Anthonys and the Packwoods, there being two families of the latter, brothers. There were also living here at that time William Huefner, now Marshal of the Pioneer Society in San Francisco, and for many years connected with the German newspaper press of that city; Charles E. Pickett, also a resident of San Francisco, often called, because of his pronounced and somewhat radical opinions on political and social subjects, Philosopher Pickett; Capt. Shannon, afterwards elected a member of the convention for framing the State Constitution; John T. Little, plying the vocation of real estate and money broker in San Francisco; Clarkson Dye, better known as Dr. Dye, an enterprising and ingenious New Yorker, having arrived at the mill along in the spring. Wimmer was with Marshall examining the mill race when the first piece of gold was found, it having been noticed by the two men at the same moment. Marshall, however, picked it up, and hence received the credit of being the finder, in so far, however, as any credit can attach to anything so purely accidental, it would appear to be due to Mrs. Wimmer, who, when the others were in doubt as to the character of the stuff, declared it to be gold as soon as she set her eyes upon it, proceeding to make what was supposed to be a crucial test of its qualities by throwing it into her soap kettle to see if it would tarnish. As it did not, after lying there over night, it was admitted on all hands that it must be gold. Among other parties who had wintered at the mill and was living there in the spring of 1849, was

The Old Mountaineer, Greenwood.

Who, with his Crow wife and numerous brood of half-breed children, occupied a capacious tent pitched in the lower part of the town, and which was made to serve the several purposes of domicile, dormitory, dog-kennel and kitchen. For this latter convenience the old fellow had not much use, the culinary operations of his household being of a simple and limited kind. Greenwood was himself a small eater; subsisted, in fact, mainly upon liquid food, his favorite beverage being whisky. By June the place had become altogether too civilized, as well as populous, to suit the old trapper's tastes, wherefore he pulled up stakes and removed to a little valley eight miles north, which still bears his name, and in which he died soon after. Greenwood, who was a native of Missouri, had from early youth spent his life hunting and trapping in the Rocky mountains and along the rivers that traverse the great western plains, and was in every respect, in his person, his habits and his morals, as good a representative of that brave and hardy, but often dissipated and reckless class, as ever trailed an Indian or trapped a beaver. The story of his life, could it be written, would form a narrative of no little interest. But as not much that is authentic in regard to his career has ever been preserved, he may be left to figure as the hero of some future romance or "Tale of the Border." Of his boys, bright and active lads, but restless as young eaglets, I have never been able to learn much. With their Indian blood, and lack of education, there was little likelihood of their betaking themselves to steady, hard work, and it is said that John, his oldest son, came to an unfortunate end many years ago. Boggs, his second boy, of whom I could relate some amusing stories illustrative of his smartness and cunning, would space allow, was the subject of a notice in a frontier paper not long since, and in which he is represented to have shot two gamblers, who bad, without provocation, assaulted him in a brutal manner. On the occasion alluded to this scion of the house of Greenwood exhibited, as might have been expected, the greatest coolness and courage, having fatally shot one of his assailants, and wounded the other, while he came out of the scrimmage himself but little hurt.

The Families Mentioned Above

Belonged to that restless class of American pioneers who, continuing to "go West" till they had reached the waters of the Pacific, had been carried this far back on the reflux tide. Crossing the plains a year or two before, these people had settled first in the lower valleys, and afterwards came up into the mountains to dig gold, bringing with them their wagons, families and a portion of their stock. Traveling with their traps, cooking by camp fires and sleeping in tents or covered wagons, was no hardship to them. Bennett was a carpenter, a short, compact built man, bristling with energy, and put up nearly all the better class of houses erected in Coloma that summer—among others Dye's hotel, for a long time the largest and best building in the place. Elihu Anthony was also an active, pushing sort of man, who, besides diligence shown in his secular affairs, when occasion required, acted also as an expounder of the scriptures and an exhorter to charity and good works. He was afterwards elected a member of the State Legislature, and to various other public positions, in all of which he discharged his duties in a manner acceptable to his constituency. Later in the summer, these families, with some others, tiring of the mines, returned to their homes at Santa Cruz, Sonora, and other towns

near the coast. The Packwoods also left, and, going as far south as the Tulare country, settled, and have since been living there, the owners of an extensive tract of fine land lying along Packwood's creek.

The Principal Trading Posts in the Place

Were carried on by General Sutter, Charles E. Pickett and Captain Shannon. Sutter occupied a double log-house standing on a little knoll half a mile south of the town, near the road leading in from the fort. Pickett's place, also a log-house, built palisade fashion, stood near the mill, Shannon's being a few rods distant. A party of Oregonians had pitched a huge tent in the center of the town, in which some provisions were sold and wheated drinking, gambling and carousing were going on day and night. Being in the hands of men not brought up to mercantile pursuits, this branch of business failed to be conducted with that closeness and system essential to success. During the flush times, while everybody had money and there was no opposition, these pioneer traders, with their easy going habits, got along well enough. But when times changed and keen competitors came in, store-keepers like Pickett and Sutter had to retire from the field, their books well filled with dubious credits.

Religious Services, Sunday Schools and Prayers.

While the rough element in California society was large from the first, there were among the primitive settlers here many devout and God-fearing people, as is evidenced by the fact that we had regular preaching and Sunday schools in Coloma even so early as the time of which I am speaking. The leading spirits in securing these religious observances were the Messrs. Bennett, Anthony and Dye, the latter two being zealous and intelligent expounders of the Word, while all of them, by their walk and conversation, illustrated practically the doctrines they taught.

One pleasant day, while divine service was in progress, there rode into camp a small party of splendidly mounted men, who, proceeding to the log hut that served for a meeting-house, jumped from their horses and hurriedly entered the place of worship. Among these newcomers was one, a short, stout-built man, with a ruddy, open countenance, who, as soon as a suitable opportunity offered, arose and unwittingly addressed the audience in a manner so entertaining and impressive that he soon gained their close attention. In the course of his remarks he disclosed the fact that he was a seafaring man and that, having just brought his vessel up the river to the embarcadero, he had come to gratify his curiosity by seeing the place where gold was first found; going on to admonish the people of the great future that was probably in reserve for the country and of the importance of gaining here for our political and religious institutions a firm foothold at the start. Having finished his remarks, the speaker knelt and offered up a fervent prayer, at the conclusion of which one of his companions also addressed a few words of kindly advice to the meeting. The first speaker was Captain Roland Gelston, who, after a successful passage round the "Horn," had brought his ship into the harbor of San Francisco, a few weeks before, and then sailed her up the river to the embarcadero, his having been the first square-rigged vessel that ever came up that far. Capt. Gelston, who was not only a Christian gentleman, but a splendid seaman, and in his death, which occurred at San Francisco some 10 or 12 years ago, our merchant marine lost one of its best sailors and brightest ornaments.

Much more of like purport might be related tending to show that the community was not all ungodly in these early times.

Of the Indian War

That for a while raged with virulence, and many other interesting reminiscences connected with the spring and summer of 1849, only brief mention can be made. This war, which culminated in the month of June, originated in a habit the Oregonians had of shooting the aborigines, according as they felt in a mood for this sort of sport, or a good opportunity offered. This naturally led to retaliation on the part of the Indians, who killed a number of the whites in the course of the spring, the victims always being Oregonians. Among others sacrificed to savage vengeance, was one of the Kelseys, of whom there were several brothers mining here at that time. At last six young men, all of them belonging to these implacable foes of the Indians, were killed at Murderer's Bar, over on the middle fork, an act that called for the immediate arrest and punishment of the guilty parties. A considerable force of whites, headed by John Greenwood and William Huefner, went after the Indians, killed some, and brought others into the mill, where ten of them were shot to death. Another party pursuing the savages over on the Cosumnes, killed some of them there, and thus put an end to their further butcheries.

Meantime the great immigration, the advance of which first reached here in March, continued to roll in; the batea and rocker began to give place to a multitude of new fangled machines; the tents and cabins were superseded by better buildings; the first stock of traders were crowded out, and the 48 miners were jostled in the diggings that they, in their simplicity, supposed would afford room for all. And thus before the summer was over the primitive town had become greatly changed, while the primitive inhabitant had disappeared in the multitude of strangers.

H. D.

Coloma, El Dorado Co., Nov. 12th, 1877.

## General News Items.

THE census of 1876 gives the population of France as 36,800,788.

THE military post on Big Horn river, Montana, is hereafter to be known as Fort Custer.

A PARTY of Mexicans pursued a band of marauding Indians into Texas recently, and punished them severely.

THE fire at the North Point Dock warehouse in this city on Monday, destroyed nearly \$500,000 of property.

A DISPATCH from Rio Janeiro states that the Argentine torpedo ship *Fulminate* exploded in the harbor of Buenos Ayres, killing 11 persons.

GERMANY and Italy have paid the balance of their subsidies to the St. Gothard tunnel—respectively, 4,000,000 and 2,700,000 francs.

ON account of the non-payment of their wages, the miners of the Keets mine, at Deadwood, Dakota, have taken forcible possession of the mine.

THE resignation of Gen. LaGrange, Superintendent of the San Francisco Mint, was received at Washington, Saturday. The President accepts it, to take effect December 31st.

LEONARD, of Louisiana, has introduced a bill fixing the salaries of Judges of the District Courts of California and other districts at \$5,500, and reducing the salaries of several District Judges to \$4,500.

THE Secretary of War has issued an order that all names of battlefields in the army register, which heretofore have been at the head of regiments, should be kept out of the record until further orders. This is in accordance with a conciliatory policy, and in keeping with Sumner's plan to erase the names of battlefields from flags.

EVERY well now being bored in Ventura county shows oil, but the operators have orders to pay no attention to a small supply, but push downward. The intention is to ascertain whether a grand reservoir exists below, as in Pennsylvania. Some leases have been made on condition that the operators shall sink to a depth of 1,500 feet, unless a certain quantity of oil is sooner encountered.

ARIZONA [TRADE.—A dispatch from Camp Grant, Arizona, dated the 12th, inst. says: The diversion of trade which was expected Eastward is now assuming a serious aspect. Directions have been received from Washington to draw all supplies for the Department of Arizona from the East, on account of cheaper prices and transportation, and mercantile firms will follow in the wake of the action of the military. Nearly all the post traders, and several firms in Tucson, are preparing to deal with the East, via the Fort Carland, El Moro and Mogollon road. This will be a heavy loss to San Francisco shippers, which can hardly be repaired, save by a reduction of prices in goods and rates of transportation by the Southern Pacific railroad. Goods can be laid down here by Eastern routes from 24 to 25 cents cheaper, with more accommodation and promptness.

STAGES TO TUSCARORA AND CORNUCOPIA.—Our agent, who has lately passed over the stage lines on this route, gives the following for the benefit of other wayfarers: "C. C. Haynes' stage line from Battle Mountain to Tuscarora leaves immediately upon the arrival of the Eastward and Westward bound trains. About 12 hours' time is saved in going to Tuscarora, and about 24 hours saved in going from Tuscarora to San Francisco by this route. W. S. Van Dreiler's stage line from Elko to Tuscarora and Cornucopia, leaves Elko every morning at six o'clock; time to Tuscarora, eight hours. Leaves Tuscarora about 6 A. M.; time to Elko, nine hours. No loss of sleep and less hours of staging by this route.

THE NATIONAL DRILL.—A correspondent signing himself "Engineer," writes us that the National drill and air compressor is doing splendid work in the Gover mine, Amador county. "It has accomplished double the amount of work done by hand and at no more cost, thus saving 50% in sinking the shaft. In running levels, etc., it will do better than this, as it does not break down."

A LETTER from a prominent broker, who is on a tour of observation through the Black Hills, says that A. W. Whitney, a former heavy operator on California street, is in receipt of \$5,000 daily for crushing ores in that country. He did not do so well down in Banner district, San Diego county, where he is pretty well known.

THE Washington *Republican* says that telephones have been placed on the lines between the White House and the Treasury, the Navy Department and Navy Yard, the Signal Office and Fort Whipple, and various other places in that city.

JOSHUA HENDY has just shipped five of his concentrators and two \$81,000 Challenge ore feeders" to the new 10-stamp mill of the Potosi mine, Amador county. The mill will probably be running next month.

BULLION.—The clean-up of the Consolidated Virginia mine, for October, was \$1,292,420.20; that of the California was \$1,674,856.79; total or the bonanzas for October, \$2,967,276.99.

THE Ophir election occurs on the 21st of December and a contest is already hinted at.

## PATENTS AND INVENTIONS.

## List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PROPRIETORS AND U. S. AND FOREIGN PATENT AGENTS.)

By Special Dispatch from Washington, D. C.

WEEK ENDING OCTOBER 30TH, 1874.

DISSEMINATING CLUTCH COUPLING FOR SHAPING.—Napoleon Beauregard, S. F.

EXCAVATING MACHINE.—John S. Hall, S. F.

Cal. and Emory W. Chapman, S. F.

SKREW PULLER.—Fredk A. Will and Julius Fluck, S. F.

NAPKIN HOLDER.—August Barlow, S. F.

CAR COUPLING.—Lewis T. Beaver, Placerville, Cal.

SEWER TRAP.—Wm. H. Gullie and Edward Deady, S. F.

SHOE FASTENER.—John S. Hall, S. F.

OVERALLS.—David Neustadter, S. F.

MACHINE FOR DRILLING OIL WELLS.—Jacob Strongel, Andrews Station, Cal.

REISSUES.

GANG PLOW.—Wm. Fruhling, San Jose, Cal.

TRADE-MARKS.

KEROSENE OIL.—A. C. Dietz & Co., S. F.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

## California and Oregon Land Company.

Location of principal place of business, San Francisco, California. Location of works, Jackson County, Oregon.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of October, 1877, an assessment, No. 1, of thirty-five cents per share was levied on the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 418 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-eighth day of November, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Monday, the twenty-fourth day of December, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Secretary.

Office, 418 California Street, San Francisco, California.

## Excelsior Silver Mining Company.—Prin-

cipal place of business, San Francisco, Cal. Location of works, Pototsi District, Lincoln County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the second day of November, 1877, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold and silver coin, to the Secretary, at the office of the company, 312 Post Street.

Any stock upon which this assessment shall remain unpaid on the third day of December, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the seventeenth day of December, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. K. MEYER, Sec'y.

Office, 312 Post Street, San Francisco, Cal.

## Mariposa Land &amp; Mining Company of

California.—Location of principal place of business, San Francisco, California. Location of works, Mariposa County, Cal.

Notice.—There is delinquent upon the following described stock, on account of assessment (No. 12) levied on the 12th day of September, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

## Buy the Best.

Before purchasing an American  
Watch, examine the different styles  
manufactured by the HAMPDEN  
WATCH COMPANY, at Springfield,  
Mass. They are the latest and  
best improved manufacture. You  
can depend upon them for fine finish,  
durability and perfect time. They  
are sold at favorable prices—in  
fact, no higher than many of the  
inferior styles. Examine into the  
merits of this Watch before you  
buy any other. Our word for it,  
you will not regret it.

DEWEY & JORDAN, Agents,  
433 Montgomery St., S. F.

To Ship and Engine Builders, Steam  
ship Companies, Etc.

A Mechanical Engineer, having an extensive experience  
in Marine Engineering (especially compound) and Iron  
Ship Building, also in Steam Engines and Machinery in  
general, is open for engagement. First-class references.  
Address and references can be obtained at office of Sci-  
entific Press.

## Machinery.

## SNYDER'S LITTLE GIANT STEAM ENGINE.

For Farmers, Machinists, Printers and all requiring  
light power. Sizes from one to six horse-power. Prices  
for engine and boiler complete, from \$150 to \$450. We  
make the strongest boiler and the best engine in the  
country. Call at our factory or send for free illustrated  
and descriptive catalogue.

SNYDER BROS., 94 Fulton Street, N. Y.

## THE O'HARRA

## CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—23 Cords at 33 per cord.....	5 25
Salt—1,600 lbs at 24 cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61 1/2

In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Exchequer mill, Alpine Co., Cal. For further in-  
formation, apply to

D. J. O'HARRA,  
Reno, Nevada.

### Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

### San Francisco Pioneer Screen Works, J. W. QUICK, MANUFACTURER.

Several first premiums received for Quartz Mill Screens and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco

## DEWEY &amp; CO.

## American &amp; Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

## Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

## Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

## Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

## Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## DEWEY &amp; CO.

## REGISTER YOUR

TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

## Thanksgiving.

Again the yearly installment of New England's legacy to this country falls due; again, by recommendation of President and Governor, there will be formal rendering of thanks in all the churches and cessation from accustomed avocation in all the busy marts and manufactories; again, devout hearts will fill with thanks to God for his loving kindness and tender mercies. It will be this year, as aforetime, a day of feasting and of praise; an occasion for family reunions in which silver locks will join hands with golden curls over the lapse of, perhaps, half a century, with eyes looking backward and forward along the course of time.

Thanksgiving day has often been distinguished as the home holiday, and truly, too, for such indeed it is. It is a priceless boon to American homes, for the impulse in this stirring quarter of the world lies rather in tangents to the home circle than in the quiet revolutions amid homo influences which quieter nations know. The making of new homes has been the chief occupation of the American people for a century and will be for many years to come. How precious, then, is an institution which calls many in person and all in thought, to the old home where early lives were moulded into such strength of manhood and womanhood that the founding of new homes became possible. We are too apt to forget the old homes and the priceless training they bestowed. We too often pursue our courses with the idea that the vigor and enterprise, which mark our progress, are proud qualities which we have ourselves discovered and developed. Such vain thoughts are untrue and unwise. It is true that conditions have evoked vigorous thought and action among those who have transformed the western wastes into the western world but the conditions would have been powerless had not those who enjoy them brought to the conquest qualities fitted for victory. We owe our advancement to the inheritance of the spirit, precept and example of the old freedom makers of the Atlantic coast. Nor did they altogether originate the quality of devotion to principle and energy in industrial achievement. Its sources lie far back among the centuries and its springs may be found here and there across the continent of Europe, from the rugged Highlands and the frozen fords to the resolute Netherlands and the majestic Rhine, to sunny France and even to the genial Mediterranean shores. It matters not whether these gifts of genius, of labor and of truth came to us through the generations which have come and gone upon our eastern shore, or whether they have come fresh from noble homes abroad, they are all now in truth American and entitled to enjoy with us the home-recalling features of our Thanksgiving Day. Thus perhaps our thanksgiving may be more catholic than that which prevails within New England's boundaries; and we believe that as it extends its scope and view it becomes more beautiful and truly American. Thus it drops altogether its sectional character. As it leads us all to return in thought and thanks to the homes from which we came, it awakens a feeling of grateful remembrance to all the nations which have joined to give the world America; the pride and hope of all who love liberty throughout the earth. With this thought, let every California home, no matter whence its founders came, make merry and give thanks on this, the American Thanksgiving Day.

It is one of the privileges of observers of the National Thanksgiving to give thanks to the Divine ruler for the material benefits which He has bestowed during the year which is closing. There are two ways by which to measure prosperity; one direct, by the good things in actual possession; another indirect, by the thought of

evils from which, happily, Providence has spared us. Both these methods will rightly enter into the mind of the Californian this year, and both will fill the heart with thanksgiving. To many of our readers the year has been one of good return for labor; to others there has been little given save life and a measure of comfort. To those whom good harvests and increased price for produce have blessed, there is an easy task to give thanks. To those, who have looked out upon arid fields or have found no market for their labor, there still remains hope for the future and thanks that their lives and strength have been preserved for it. We are reminded that the year has been hard in California, that crops have been of lessened amount and that the laborer has been without his hire. We deplore it and lack no appreciation of the deprivation and self-denial which have been undergone by brave hearts. But have we no thanks to render to God who has given us enough to maintain life and courage while thousands in India have been crushed beneath the heel of relent-

less famine? It is true also, that never in our history as a State, have we experienced such a lack of employment for labor and all its attendant evils. It is true that our laboring men have been urged by their want upon the verge of disturbance, and the impulses of misguided humanity have arisen in their minds. But does not the present peace and quiet call for thanksgiving when we think of the 70,000 Russians who have thus far fallen, and of the thousands of Turkish homes which have been pillaged and laid waste? Indeed, when one looks aright upon the measure of discomfort and reflect that no small part of it is owing directly to our unwise action and untrue policies, there seems no cause to restrain full-hearted thanksgivings for manifold blessings, but rather to rejoice and resolve that the lessons of the year shall not go unheeded by.

SNYDER'S IMPROVED "LITTLE GIANT" ENGINE AND BOILER.

As is our happy privilege, we extend to all homes to which our words shall come, our sincerest good wishes for the joy of their Thanksgiving merry makings and reunions. Nor would we forget to remind them all, that the quality of giving, like mercy, is twice blessed, and if they would enjoy their own plenty to the utmost, they must not forget those homes

which look, and into which they can bring light and comfort by their thoughtful bounties. Let all see to it, that no home within their knowledge fails of material to make November 29th indeed a Thanksgiving Day.

## The Little Giant Engine and Boiler.

We illustrate herewith one of the improved "Little Giant" horizontal engines and vertical boilers, manufactured by Snyder Bros., 94 Fulton street, New York. This engine is of the new design and has many radical improvements over the old one of the same name. Fig. 1 shows the boiler and engine with the necessary pipe connections, etc., and Fig. 2 is a vertical section of the boiler.

In the boiler all the joints are screwed together, while the large central tube B, as well as the smaller side tubes 6, 6, are lap-welded. The strength of ordinary riveted joints are esti-

mated at 44% less than the boiler plate, but lap-welding makes the shell virtually a continuous piece of metal of uniform strength. The stay rod, 2, as well as the side tubes, 6, 6, are connected to the main shell of the boiler B by means of an ingenious device known as a "double tapered bushing." This system of construction avoids all the weakening caused by riveted seams, and avoids the injuries so common to caulking.

Among the improvements in the boiler is the substitution of the smoke-bonnet, A, for the elbow at the side, formerly used for conducting the smoke to the chimney or stack. This arrangement allows the heat and gases to circulate uniformly among the small tubes which constitute a large part of the evaporating surface and materially improves the natural draft. The Little Giant boiler, as originally made, was open to the objection common to all of the external fire-box type, viz., that as the furnace is not surrounded by water space, a considerable amount of heat is lost by radiation. To obviate this difficulty, second or inner casing, S S, is introduced, which extends from the top downwards and behind the fire-brick furnace lining, 15 15, to a point below the grate. The

outer or main casing is perforated with a row of holes near the top, which may be opened or closed at will by means of a band similarly perforated. When both the furnace and ash-pan doors are closed and the damper band is in such a position as to uncover the holes, the air enters and passing downward, as indicated by the arrows, absorbs the heat radiated through the inner casing and returns it to the fire. With the damper band closed and the usual draft through the ash-pan door, the boiler is as effective as an ordinary stove for heating the room.

Of the important changes made in the engine we notice the substitution of a circular slide valve, with an auxiliary steam port, for the ordinary rectangular or D valve; the steam and exhaust ports on the face of the cylinder being also curved in such a manner as to correspond suitably with the form of the valve. It is held in proper position by a circular yoke attached to the valve stem in which it is perfectly free to revolve. A novel as well as important feature in its action is that the area of port opening increases in proportion to the increased speed of the piston from the commencement of the stroke, thus maintaining uniform pressure in the cylinder until the point of cut off is reached.

The use of an elemental governor in place of the ordinary ball governor secures a more uniform speed than is possible with the latter kind unless under varying loads. A feed water heater under the engine, through which the exhaust steam is conducted in small pipes, heats the feed water up to the boiling point before reaching the boiler. The heater is so constructed and placed in such a position that it does not increase the space occupied by the engine. The steam and water spaces are easily opened for inspection or cleaning without disturbing any pipe connections. Messrs. Snyder Bros. also manufacture a variety of engines adapted to different uses, among which are single and coupled engines with cranks at right angles, with or without link motion and reversing levers, suitable for yachts, hoisting purposes, etc.

THE PARIS EXPOSITION.—The House of Representatives yesterday (Tuesday) passed a bill appropriating \$150,000 to defray the expense of representing the United States at the coming French Exposition. The bill provides for the appointment of a Commissioner-General and 20 additional Commissioners; provided that no two of said Commissioners shall be appointed from one State. Three of said Commissioners shall be practical artisans, three shall be skilled representatives of commerce and manufactures, four shall be practical agriculturists, and nine shall be scientific experts. The 20 additional Commissioners will be assigned to report upon the nine groups into which the Exposition will, under official regulations, be divided, the Commissioner-General to report upon the exhibition at large and the general results thereof. The allowance to said Commissioner-General for salary and personal expenses shall not exceed \$5,000 for his term of office, and the allowance of the 20 additional Commissioners for salary and personal expenses shall not exceed \$1,000 each. The President may appoint two Honorary Commissioners from each of the several States, and the President may appoint 24 additional Honorary Commissioners, among whom there shall be at least one resident of each of the Territories, which said Honorary Commissioners may report on special subjects, but shall not be entitled to either pay or compensation out of the money appropriated. The money appropriated shall be expended under the direction of the Secretary of State, and the Commissioner of Agriculture shall collect and prepare suitable specimens of the agricultural products of the several States and Territories for the exhibition.

KARS has been captured by the Russians.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### Trees and Rainfall.

No. 1.

[Written for the Press by SAMUEL PURNELL.]

#### The Approach of the Desert—The Crime Against Posterity.

It has been the fortune of but few people in any age of the world to understand the forces of nature, and to wield them for beneficent purposes. The talents of mankind have been mainly applied to the art of desolation, and to impeding nature in her efforts to bestow upon her children the blessing of trees and rain. Man modifies, if not determines, the material structure of his earthly home, and his influence upon the condition of the country he inhabits, has been much greater than any of the recent geological changes. In more barbarous times than the present, man sympathized with the beneficent operations of nature, because he lived closer to her; his home was in the forest, he reposed in its shade, subsisted by its fruits, and made the trees his shelter and his defense. He was the offspring of the forest, and he tenderly cared for his progenitor. Primeval man, in want of a fire, did not fell a tree, but contented himself with fallen wood; in want of a hut, did not destroy an acre of timber in search for the choicest lumber, but was satisfied with a few rough slabs; he did not set fire to the neighboring forest for the gross pleasure of destroying, for he knew that same forest was his nourisher and preserver, furnishing him food, shelter and clothing. Abundant rains watered the primeval forests—which almost universally covered the earth—the trees and shrubs and grass grew vigorously, there were neither extremes of heat nor cold, floods nor drouths. Here man was evolved and developed, and started upon his career of progress. As he increased in numbers and his wants augmented, he partially outgrew these primitive conditions; he needed soil to cultivate, in order to raise more nutritious fruits and grains than were spontaneously produced; he needed land to build his towns upon, he required wood to build his houses and ships, and to accomplish this it was necessary for him to fell a portion of the forest. Entering upon wars, the forests were often destroyed to provide war material and shelter, or to prevent them from supplying the same to enemies. As the numbers of people increased, more and more the trees were felled, more and more the primitive forests disappeared, more and more the land was stripped of its covering, till gradually and irresistibly the quality of the seasons changed, and changed for the worse.

As among our earliest historical records appear those of

#### Western Asia,

The consequences of this war on nature there will first be noticed: In the course of a few centuries from the date of the earliest annals, indications were perceived of a want of summer rains. That country had been among the most favored and fertile portions of the earth; there was located the fabled Garden of Eden. At length the rains refused to fall during their accustomed seasons; they fell in floods at long intervals, and during those intervals scorching heat and dreadful drouths supervened. In a short time the crops became uncertain, the summer rains ceased, and the inhabitants were forced to resort to irrigation in those places where the floods of winter could be stored up against times of drouth in the valleys. The high lands were by this time abandoned by husbandmen. The rivers began to fail in summer, and bore little water, except that resulting from occasional destructive torrents. Irrigation answered for a time, but, as the few remaining forests were sacrificed to the folly of the people it was seen that the annual rainfall diminished; the mountain springs became dry, the irrigating reservoirs and canals contained no water, and no crops of fruit or grains could be produced from the hard and withered soil. The ultimate result of man's warfare on nature approached, the hot blast of the desert swept over the ruined land, covered it with sand, and most of the wretched inhabitants who remained emigrated or perished.

Such is the sylvatic history of Persia, Arabia, Armenia, Asia Minor, Northern Africa, portions of Greece and Rome, and of most of the lands that border the Persian Gulf, the Red and Mediterranean seas. The ancient countries of Western Asia are now but scenes of desolation. The countries that sent forth the conquering armies of Darius, Xerxes and Cambyses have been for many centuries covered with sand, parched with sun and drouth, and their miserable inhabitants reduced to small numbers, alike objects of pity and contempt. No considerable number of people now dwell or could now subsist upon the northern shore of Africa, were once Carthage, the great city of a great State, held sway over a large population of tillers of

the soil. The song of the German poet is realized:

"Africa's barren sand,  
Where naught can grow, because it raineth not,  
And where no rain can fall to bless the land,  
Because naught grows there."

More than half of the country embraced in the Roman empire is

#### Now an Uninhabitable Desert,

And surrendered to hopeless desolation, and the teeming multitudes who lived there in plenty have disappeared, leaving no posterity. The forests have been destroyed, the soil has been washed away by floods, springs and streams are gone, and the earth is covered with sand. Of the former productiveness of the soil we can now discover but few traces. A country as large as the whole Christian world of to-day, has become devastated and unfit for human habitation. Such has been the consequence of man's disregard of nature's laws in the preservation of the forests, often the result of war and social and ecclesiastical tyranny and misrule.

#### Results of the Ravages of Man.

It is melancholy to reflect upon this ruin, and to know that these results were and are directly and solely caused by the ravages of man. Man, in his state of ignorance and supreme selfishness, has, during the historical epoch, acted as though the trees, planted by nature to increase and protect the soil and to produce rain, are his enemies or obstacles to his advancement, and has turned his energies to their destruction. Wherever man has planted his foot, the harmonies of nature have been turned to discords, and he has been a destructive power. Unfortunately, indeed, for himself and for his posterity, the living trees and grasses have been the most convenient to his wasting hands, and upon them he has wreaked his malice and selfishness. But he brought upon himself his own punishment, for the vengeance of outraged nature overtook him and punished him and his descendants with the curse of drouth, sand and destruction.

### Wilhelm's Dry Placer Amalgamator.

EDITORS PRESS:—In your issue of October 20th I read an account of some dry placer machines, and I judge from it that considerable interest is manifested in California on this subject. It might be important for some of your readers to know that a third machine has been invented, and I proceed to give some facts concerning it. This machine is "Wilhelm's Dry Placer Gold Separator," on which Mr. J. H. Wilhelm, of this city, has been at work for nearly two years. A new test machine with improvements was recently constructed, and was operated about a week ago on a mine three miles up the Platte from this city. It was found to be successful, even beyond the inventor's expectations, the dirt being washed thoroughly and every visible particle of gold being saved. The machine consists of a cylinder constructed in such a manner that the front part of it is a washing basin. The lifters or dashers in this basin tumble the dirt so as to loosen and disintegrate it. It is then thrown along by the revolutions of the cylinder on to a screen, which allows the gold and fine material to pass through into small sluice boxes, while the boulders and coarser stuff are thrown out below. Thus there are two kinds of tailings, coarse and fine, the fine being composed largely of black sand. The water is supplied through a perforated pipe which forms the axle of the cylinder. A provision is made in the machine for catching nuggets, if there be any in the mine, so that every contingency is provided for. The capacity of the machine depends only on its size, and its size is regulated by the supply of water. It is proposed now to construct four sizes: The half-inch machine, using half an inch of water, the inch machine, one inch of water, the one-and-a-half-inch machine, and the three-inch machine—the latter to run either by horse or steam power. Its cylinder will be four feet in diameter by eight feet long. It will be fed by elevators, and its capacity will be very great. The machine recently experimented with was the one and one-half inch *hand machine*. It uses from one to one and one-half inches of water, and under slight pressure weighs, without the tank, not more than 200 pounds, if as much. The price of this size is \$200, complete without the tank. It requires two men to work it, one to feed and the other to turn the crank. When pumping into the tank was difficult, and no power was used, it might need a boy or another man. The machine will dress what two men would shovel into it, but where two men feed the turning is heavy, and a jack, mule or weight power would have to be attached. The gold is caught in three 12-foot lengths of narrow sluice boxes with a *bored* rifle, and the cleaning up is the same as in sluicing, only the amount of black sand and fine gravel mixed with the gold is very small.

The machine tested used only two lengths of sluice, and in cleaning up there was but a fair panful of dirt. No mercury is used about the machine. Of course the amount of gold saved depends entirely upon the richness of the ground—the richer, the more gold, as in every thing else. Some of the gold secured by this machine was so fine as to be barely perceptible. The very finest is saved, for there is no strong current of water to carry it off. The work of removing the coarse gravel and boulders is done by the machine itself. The half inch machine

will be very light, and is designed as a sort of prospecting machine, or to work where ground is very rich, and water perhaps entirely absent. The water used by any of the machines can be settled in a reservoir and pumped back into the supply tank. In many places where there is rich ground, and only a minute stream of water two large tanks can be constructed. Into the upper one the stream or spring can be turned during the night, and the lower one will catch all the waste during the day. Therefore only a small per centum of the precious fluid need be wasted. Miners generally have horses and mules, and they can always be utilized during the daytime for power, a small horse-power being light, and costing little. The cylinder is required to make only about 20 revolutions to the minute, so that, with proper gearing, a pair of mules might run several half-inch machines, and do all the pumping besides, thus leaving the operators to feed the machines to their utmost capacity.

Wilhelm's machine is patented, but no company has been formed yet, though the parties interested are prepared to build some machines. It is expected that by next spring the company will be fully organized. They propose now, instead of manufacturing for the whole gold producing region, to sell rights, and to retain only so much as can be readily attended to. Very truly yours,  
F. S. DELLENBAUGH.  
Denver, Colorado, Nov. 10th.

### Calaveras County Mines.

EDITORS PRESS:—The San Bruno Con. G. M. Co., at a recent cleaning up of about 300 tons of ore from the San Bruno, it exceeded the most sanguine expectation of the Superintendent; the rock was unassorted, and a great deal of vein matter and dyke was mixed up with the ore. Notwithstanding all this it paid upwards of \$25 per ton. John L. Hoey, Esq., is Superintendent. They have now commenced to sink, and after sinking 100 feet will drift east and west.

#### The Banner Mine,

Col. J. W. Johnson, Superintendent, having freed the mine of water and put in new 8-inch Cornish pumps, has begun to sink on the main shaft and is working also in the drifts. The first piece of rock taken from the mine, under the present administration, showed free gold.

#### The Holmes Mine

Has a tunnel in about 350 feet; vein from three to five feet in thickness, which prospects finely. On the property is a 10-stamp mill, which is now being got in readiness for a crushing from the mine. It is expected that the mine will furnish ore in sufficient quantities to keep the mill constantly running.

#### Blue Jay and Greenhorn Con. Co.

This consolidation is still running and still continues to yield as rich rock as ever. Work continues in main shaft and drifts, and a force of men are now engaged in building a whim. The last crushing from this mine at the San Bruno mill yielded over \$100 per ton. Several hundred pounds of specimen rock has been sold to manufacturing jewelers at \$16 per ounce, rock and all. The Blue Jay is the property of Rodgers, Potter & Spaulding.

#### The Sledge Hammer

Is owned by Lee Sampson, Esq. Work has been resumed on this mine with flattening prospects.

#### The Valentine Mine.

A large force of men were put to work on this mine last week, and the company are now building a large 20-stamp mill for custom purposes, and also one at the mine for the use of the mine.

There are several other mines that will start up during the month, and Mosquito is at the present time as lively a camp as any in the State.

Several new houses are in course of construction. The Banner hotel will put on an extension of 20 feet. Harrison Longley has opened his hotel and placed Mrs. F. Peck in charge. The Hotel de Woodcock has thrown open its doors. A miners' outfitting establishment will also shortly be started. Mosquito now contains five hotels, viz.: Banner, Briggs, Longley, Woodcock and Gross Mamma, two saloons and a blacksmith shop. "ONALED."  
Mosquito Gulch, Calaveras Co., Nov. 15th.

EXPENDITURES ON CLAIMS.—The General Land Office has rendered a decision of importance concerning Section 2,324 of the Revised Statutes, which requires a certain annual expenditure on all mining claims. Commissioner Williamson holds that the first annual expenditure upon a claim located prior to May 10th, 1872, should have been made by the first day of January, 1875, and the second by January first, 1876; also, that the first annual expenditure upon a claim located since May 10th, 1872, should have been made or must be made within one year from date of discovery and location, and that the amount required by the local mining laws or regulations to be expended before a record of such claims can be made may apply upon the first annual expenditure on claims thus held, if the other provisions of law are complied with. The second year commences immediately on the expiration of the first, and the required expenditures may be made at any time during the year.

### A New Ore Feeder.

Chas. C. Stevenson, of Gold Hill, Nev., has patented through the MINING AND SCIENTIFIC PRESS Patent Agency, an improved ore feeder. The hopper is made in the usual way. The shoe or tray is made considerably wider than the lower open end of the hopper, and it is permanently secured below the hopper at a slight inclination, so that the ore which passes through the lower end of the hopper will be received upon it near one corner. The shoe extends to a sufficient distance in front of the hopper to deliver the ore which drops from its extremity into the battery and this extremity has a little more pitch than the main length of the tray. The tray is immovably fixed below the hopper so that it receives the ore from the hopper on one corner. In order to move the ore forward from underneath the hopper and feed it over the front edge of the tray a horizontal rotary hnh, provided with a number of radiating arms is employed. This hnh is mounted on the upper end of an upright shaft, which steps on a bearing below the tray while its upper end passes through the bottom of the tray near its center. As the tray is slightly inclined this shaft will also be correspondingly inclined. The hnh and arms lie close to the bottom of the tray and the arms extend out as far as it is possible for them to move around in a circle in the bottom of the tray, when the shaft is rotated.

The upright shaft is rotated by power derived from the drop of the stamp in the usual way of operating automatic ore feeders, so that each time the stamp drops it causes the hub and its arms to rotate slightly, and thus carry forward and drop a quantity of ore into the battery.

The arrangement for rotating the shaft by the drop of the stamp consists of a lever which is pivoted to the frame so that its short end extends out alongside of the stamp stem in condition to receive the stroke of the tappet and he depressed when the stamp drops. The opposite extremity of this lever is inverted by a pitman with friction clutch. This clutch engages with a wheel which is secured upon a horizontal shaft, so that each time the lever is depressed by the drop of the stamp the shaft is partially rotated. This shaft extends horizontally beneath the tray, one end being supported in a suitable bearing which is attached to the corner timber of the feeder frame, while its opposite end is supported by the hollow standard which surrounds the upright shaft. A bevel wheel on this shaft engages with a bevel wheel on the upright shaft, thus transmitting the rotary motion to the upright shaft and its arms.

The inventor has also devised a very simple and convenient device for adjusting the stroke of the lever for regulating the feed. The arms of the horizontal wheel will serve as moving scrapers to carry forward the ore and drop it into the battery. By this means the feeding of the ore is rendered positive whether it be wet or dry.

A COSTLY RAILROAD.—A costly railroad will be the extension of the Metropolitan District line in London—a section one mile and sixteen rods long, known as the "inner circle completion," as it will connect the Metropolitan and Metropolitan District roads (both underground lines) at their eastern ends, and make it possible to run trains entirely around the ellipse formed by the two roads, which at present are connected only at their western ends. This link is estimated to cost £2,100,000, or at the rate of about \$10,000,000 per mile. The city will, however, allow \$2,500,000 for a new street which has to be constructed in connection with the work, and which has to be done by August 7th, 1879. Costly as this work is, says the *Iron Age*, we have something quite comparable to it in expense in this country in the great St. Louis bridge, which, however, has but the merest fraction of the tariff which supports the London underground roads. This single mile of road will cost more than the entire system of elevated roads proposed for New York.

A DIAMOND drill is to be started on the 1,600-foot level of the California mine. The object is to find out what lies to the eastward. The east clay wall has never been found anywhere beyond a point 200 feet north of the south line. The diamond drill is to be sent in search of it. No drift has ever been run into this portion, for the reason that it was feared a flood of water would be let in that would drown the lower levels of the Ophir and all else in that vicinity. By using the drill the region in question may be prospected and a rush of water guarded against, as should there be a flow sufficient to give trouble the drill hole may be plugged up. The place in which this prospecting is to be done lies in the direction in which the recent development was made in the Ophir, but 500 feet above the new Ophir body.

MAGNETISM OF NICKEL AND COPPER.—Mr. Hall affirms in the *Monitor Scientific* that with feeble currents the magnetic power of nickel is equal to that of soft iron, but with stronger contents it is comparatively futile. Under any circumstances, however, the magnetic power of cobalt is much inferior to that of the other two metals.

THE Crown Point mine is yielding 50 tons of ore per day, which is being milled at the Mexican.

## MECHANICAL PROGRESS.

## Transmitting Power Long Distances.

Prof. Osborne Reynolds delivered a long and valuable address before the Manchester Scientific and Mechanical Society, on the transmission of power long distances. He analyzed all the means proposed carefully and arrived at the following conclusions: Twenty miles appears to be the outside limit to which power may be economically transmitted, even when the power can be had for nothing, and the most economical means of doing this is probably the wire rope. This review, therefore, shows the hopelessness of our ever utilizing the natural sources of power, such as tidal rivers for mechanical purposes, unless we conduct them on the banks of those rivers. But as regards the substitution of a general source of power for the small steam engines now in use in our towns, the case appears more hopeful; and, what is more, this has already been done in some instances. In the most notable instance, that of Schaffhausen, the power is obtained from the Rhine at a point close to the town and is conveyed along the banks of the river, which crosses the ends of the streets of the town by wire rope, which, as it passes the ends of the streets, gives motion to shafts which are laid in a channel under the pavement, and from which the power can at once be introduced into the various manufactories. In our own country, also, in the town of Hull, I believe that pipes have been laid down to convey the power derived from steam in the form of water, under a pressure of 600 pounds, over some part of the town. It does not appear unreasonable, therefore, to suppose that something of the same sort might be done in our own city. Considering that a very large proportion of the power required in our warehouses is for hydraulic presses, it would appear desirable that, in part at least, the power should be communicated to water pressure. Where rotary motion is required, the machinery might be driven by pressure engines, but as this would entail considerable waste, and as power may be more cheaply conveyed by compressed air, it might be better to supply both water and air; as regards the mechanical means, ropes and shafts. Although the former appears on the whole to be the most economical means of communicating work, and to a certain extent, their superiority is supported by the instance of Schaffhausen, considering their inconvenience in a town I think that the pipes would be preferable. With the ability to have either water or air at the most convenient pressure, and at a reasonable cost, I think that but few users of power on any but the largest scale would care for the trouble, danger, dirt and expense of having steam engines of their own; and if this be so, there would then be a chance of reducing the impurities in the air. Looking at these facts, I cannot help thinking that there is open to the engineer a field of enterprise, in which he may not only find remunerative employment for his talents, but in so doing confer a great benefit on his fellow creatures. This may not be so. The scheme, when closely considered, may be found wanting, but it will have served my principal purpose if it has helped to illustrate and render interesting what would have been otherwise desultory remarks about the transmission of work.

**STIMULATING PROGRESS AMONG YOUNG MECHANICS.**—Honorable competition in actual work is a great incitement to progress. This we think is well applied by an English society of turners. The subjects of competition were turning in ivory, pottery, stone and jet; and steel, brass and gold for horological purposes. The competition in ivory included vegetable ivory. The qualities considered in awarding the prizes were: Beauty of design, symmetry of shape, utility, and general excellence of workmanship; exact copying, so that two objects produced should be facsimiles in every part, or exact measures of capacity; fitness of the work or design for the purpose proposed; ability to turn, whether circular or oval; and novelty in application of turning or in design. Carving was admissible, but it was to be subsidiary to the turning. The candidate was to make his own selection from the above conditions; but the one who best fulfilled the largest number, including the most important qualities, was preferred. The work to be all hand turning, produced in the lathe without special rest or tool apparatus, and the carving to be the work of the exhibitor.

**HOW OUR MANUFACTURES GAIN ENTRANCE TO ENGLAND.**—In a large carriage manufactory in England, a few months since, says an exchange, the directors wished to introduce an American machine for the manufacture of wheels. A number of workmen were inclined to use it, as they could earn higher wages and their work was less laborious, but they were ordered by their trades unions not to use it, and the machine was, consequently, set aside. Since then American machine-made wheels have been imported, and their importation increases every day.

**PROGRESS.**—An exchange says: The car manufacturers at the West appear to have plenty of orders in hand, and the business has not looked so promising since the great collapse four years ago. The road shops are also full of work.

## The Manufacture of Mosaics.

The modern process of making mosaics now commonly followed in Rome is this: A plate, generally of metal, of the required size is first surrounded by a margin rising about three-quarters of an inch from the surface. A mastic cement, composed of powdered stone, lime and linseed oil, is then spread over as a coating, perhaps a quarter of an inch in thickness. When set, this is again covered with plaster of Paris rising to a level with the margin, upon which is traced a very careful outline of the picture to be copied, and just so much as will admit of the insertion of the small pieces of smalto or glass is removed from time to time with a fine chisel. The workman then selects from the trays, in which are kept thousands of varieties of color, a piece of the tint which he wants, and carefully brings it to the necessary shape. The piece is then moistened with a little cement and bedded in its proper situation, the process being repeated until the picture is finished, when the whole, being ground down to an even face and polished, becomes an imperishable work of art. The process is the same for making the small mosaics so much employed at the present day for boxes, covers or articles of jewelry, and this work is sometimes upon almost a microscopic scale.

The Florentine mosaic which is chiefly used for the decoration of altars and tombs, or for cabinets, tops of tables, coffers and the like, is composed of precious materials in small slices or veneers, and by taking advantage of the natural tints and shades which characterize the marble, the agate or the jasper, very admirable effects may be produced in imitation of fruit, flowers or ornaments. The use of this kind of mosaic is extremely restricted, on account of the great value and expense not only of the materials but of the labor which is spent upon them. None but the hardest stones are used; every separate piece must be backed by thicker slices of slate or marble to obtain additional strength, and every minute portion must be ground until it exactly corresponds with the pattern previously cut.

## Increase of Labor-Saving Machinery.

A feature of the Massachusetts census of manufactures for 1875, says the *Iron Age*, deserving especial notice, is the showing made in regard to the effect of labor-saving machinery on the production of some of the leading staples. We find that, with 24,151 hands employed in 1865, there was produced 175,875,000 yards of goods, a ratio of 7,355 yards to each employee. In 1875 there was produced 874,780,000 yards by 60,176 employees, or about 11,213 yards to each hand. This shows that with an increase of a little over 149% during the 10 years, in the number of hands employed, the quantity of cloth produced was increased nearly 392%. Woolen goods also make a very striking exhibit. For 1865, the production is placed at 46,008,141 yards, and the number of employees 18,733. For 1875, the production is 90,208,250 yards, and 19,036 employees, showing an increase of 96½% in production to 1½% in the number of employees. The number of pairs of boots and shoes made in 1865 was 31,870,531, and number of employees 58,281; and in 1875, 59,762,866 pairs, with 48,090 employees. This is probably the most important showing made, the production during the 10 years having been increased nearly 88%, while the force employed was less by 4,731. The product of carpetings in 1875 increased fourfold as compared with 1865, while the increase of force employed was less than half that amount. The average value of the boots and shoes produced in 1845 was 70 cents a pair; in 1855, 80 cents; in 1865, \$1.80; and in 1875, \$1.50. The value of carpetings was \$2 per yard in 1865, and less than 73 cents per yard in 1875—which shows the source of the immense supply of dollar carpetings. The great reduction in the number of employees in the clothing business shows to what an extent the sewing machine, the machine shear and mere careful gradations of "ready-made" have superseded the need of the tailor and the needle-woman.

**LABOR, CAPITAL AND ENTERPRISE.**—The author of "The Man Without a Country," has a story for the times commenced in the November *Harper*, entitled "Back to Back." The moral of the story is, that even in these dull, hard times, if capital, enterprise and labor will stand "back to back," they will succeed. There is capital enough and labor enough, but capital is fearful, and labor is powerless without capital, so alone they accomplish nothing. What is wanting is the third person, enterprise and executive ability, to act as a connecting link between the necessary ingredients, to start the wheels of industry. And those three must stand "back to back," assisting each other, and with perfect confidence that each one will do his full share in the struggle, to insure success. That can never be achieved while the three parties in interest are quarreling among themselves, or jealous, suspicious and distrustful of each other. In the first place, capital wants to know that enterprise and skill have the power for production, that the raw material can be had, and that the labor to transmute it can be obtained, and that it is willing to assume a portion of the risk, with the assurance of sharing in the success. And, on the other hand, labor must have the same assurance that the other two parties are in earnest, and are willing to assume the same risk, and not look for profit until it is made and shared in by labor.

## SCIENTIFIC PROGRESS.

## What is a Diatom.

One of the first beauties which are put on the microscopic stage for the gratification of a visitor is apt to be a group of diatoms, and beautiful as these minute shells are to the tyro, they possess doubled charm to the skilled microscopist, and give him opportunity for years of study. At the last meeting of the San Francisco Microscopical Society, President Ashburner read a very interesting paper, being a translation, by him, of an essay on the subject "What is a Diatom?" by Mons. Julien Deby, taken from the "Proceedings of the Belgian Microscopical Society," and, were it not for its great length, would find a place in our columns. The paper was illustrated by drawings on the blackboard, by Mr. Kinne, and was a careful resume of all that is known of the life and history of these wonderful forms of vegetable life, as ascertained by the investigations of Mr. Deby, and which confirmed the researches of such distinguished contemporaneous diatomists as Thwaites, Wallich, Hofmeister, McDonald, Wm. Smith, Piltzer and H. L. Smith. Aside from the elaborate description of the parts of the diatom, and their method of reduplication and conjugation, which was listened to with great interest by all present, the following general remarks are published, as they may give rise to more extended thought and study of these truly wonderful organisms:

"The little microscopic organisms, of which we propose to say a few words, are distinguished from non-cellular algae, properly so-called, as infusoria are distinguished from rhizopods, by certain well-marked characteristics. They form one of the numerous links which exist between what we are still disposed to call empirically the animal and vegetable kingdoms.

"The only connection between the surrounding and nourishing liquid in which the diatoms live, exists in the circumference, so to speak, of the connectives (between the valves of the frustule); also in certain pores, somewhat problematical, along the line of the connectives with the corresponding valves, and always in the form of lineal joinings, which are only visible by means of our most powerful modern objectives. Neither pores or openings are probably ever found in the frustules of diatoms, notwithstanding the assertions of certain microscopists. Neither does solid matter ever penetrate from the exterior into the interior of living diatoms; they drink, but they do not eat.

"The curious active movements of certain diatoms always occur in an obvious manner (the principle of which is, however, obscure), by a vital action along the joinings mentioned. This is so true that if, owing to any cause, a frustule is stopped in its course by an unsurmountable object, the translating force is immediately seen to be converted into another, which causes all the small bodies about it, which are floating in the water, to move backward and forward with great rapidity.

"We believe that diatoms possess other means of reproduction beside that of conjugation, but the life history of these minute beings is too imperfect for us to venture any hypothesis in this direction. The modern appearance of species where none existed before; their periodical succession, year after year, at definite seasons, without being able to find any in the interval in the same locality, give rise to the possibility of a mode of generation, which is as yet only suspected, by means of germs—by micro or macro zoospores, and, perhaps, in the first instance, with the formation of zygozoospores, as occurs in the case of living algae of the lower orders and situated under the same conditions as the diatoms.

"We foreshadow here a most interesting field of study, and one which is almost new to the naturalist provided with a good microscope and possessing the time and patience necessary for this kind of study; and we think we can say with confidence that whoever will follow with care the entire life-history of a single diatom, no matter how common the species, will render a greater service to science than by describing and drawing hundreds of the siliceous frustules from the four quarters of the globe."

**DISTANCES IN THE SOLAR SYSTEM.**—At a recent meeting in New York city, Prof. Stephen Alexander, in a paper, entitled "Laws of Extreme Distances in the Solar System," showed the relation of various members of the solar system and the curious proportions existing between them, the whole indicating that in their organization they have obeyed the rule of law. The ratios of the planetary distances for example he pointed out as follows: Neptune to Uranus, two-thirds; Uranus to Saturn, one-half; Saturn to Jupiter, one-half; Jupiter to Asteroid, one-half; Asteroid to Mars, two-thirds; Mars to earth, two-thirds; earth to Venus, two-thirds; and Venus to Mercury, one-half; and then he showed that the difference between the distances according to law, and in fact, were small, not exceeding in any of the preceding instances .078. Tables of relations for the systems of Jupiter and Uranus were given, which also showed remarkable approximations of theory to fact.

## The Origin of Storms.

At the late meeting of the National Academy of Sciences, held at Columbia College, New York, Prof. Elias Loomis read a paper on the origin of storms, based upon data obtained by the United States Signal Service. He stated that our great storms begin in the neighborhood of the Rocky mountains, and that no example is found of any considerable storm arising on the Pacific coast, south of Oregon. At the outset there is generally an area of several hundred miles diameter, through which the barometer stands at mean. On opposite sides of this area, generally east and west, at a distance of 1,000 miles apart, are areas of high barometer. The atmosphere in these side areas begins to move toward the central area. The currents thus established are deflected toward the right by the earth's rotation, and a diminished pressure results over the central area when the inflow increases and comes from all sides. The area of low pressure assumes an oval form, but if the winds are very violent, it may be more nearly circular. With rotation a centrifugal force is developed, which increases the pressure, and within the latter there is an upward movement of the atmosphere which carries large amounts of vapor, which, on cooling, condenses as rain. The heat liberated by condensation increases the rarefaction of the area, and thus rain increases the force of the storm though never originating it. The upward motion within the storm area takes place chiefly on the east side, so that the depression at the center is constantly transferred toward the east, unless, however, there is a great precipitation of vapor on the west side of the area, in which case the storm is held stationary or even moved westward.

**INTOXICATING GRASSES.**—Dr. Hance gives in the *Journal of Botany* for September a supplementary note on intoxicating grasses. The plant treated of on this occasion is *Stipa Siberica*, Munro, which had been found to poison horses at Gulmiz, Kashmir. Prof. Dyer suggested that the *Stipas* may be only mechanically poisonous, like *Hordeum pratense*, but Dr. Hance thinks the symptoms opposed to such a supposition. In the recently published English translation of Przevalsky's travels, the Alaskan poisonous grass is stated to be a species of *Lolium*, but the native herds carefully avoid eating it, as the cattle of Kashmir refuse the *Stipa*. In part 22 of Messrs. Trimen & Bentley's "Medicinal Plants," recently published, there is given a figure of *Lolium temulentum*, Linn., and an account of its so-called poisonous properties. Mr. A. S. Wilson, of Aberdeen, ate large quantities of it daily for some time and found it quite harmless. It is suggested that in this case the poisonous property is due to ergot. It would indeed seem that grasses are poisonous only in two ways—mechanically (like *Hordeum pratense*), or when afflicted with ergot or some other disease. Farther experiments are much to be desired.

**EVIDENCES OF A LUNAR ATMOSPHERE.**—Prof. Alexander brought forward at the last meeting of the National Academy of Sciences, a variety of evidence tending to indicate some envelope, like an atmosphere for the moon. The evidence was principally drawn from observations during eclipses. The explanations usually offered for the bright band seen around the moon at such times were fully considered, and shown to be inadequate, though good as far as they would apply. The ruddy band of light is much too broad to be the sun's chromosphere. Various experiments proved that it was not a consequence of contrast alone. It was most apparent in those instances where the moon was nearest the earth. It could best be accounted for by supposing an atmosphere to the moon—a thin remnant of ancient nebulousity, comparable to that which accompanies the earth and gives rise to the appearance of the aurora borealis.

**MITT TRANSFORMATION.**—At a recent meeting of the St. Louis Academy of Science, Prof. Riley gave an account of his observations and experiments on *Astoma gryllaria*, Le Baron. He has, during the summer, proved by experiment that, as he first suggested over three years since would be the case, this little six-legged mite, which preys parasitically on the winged locusts, is the larval form of *Trombidium sericeum*, Say, a larger six-legged mite that preys upon the eggs of the locust. Hatching from minute eggs laid in loose masses in the ground, the *Astoma* form crawls on to the locust, fastening and swelling as a tick does on a dog. The *Astoma* at last drops from the locust to the ground, where it slowly goes through its transformation into the *Trombidium*. As wherever the locust abounds this *Trombidium* also necessarily prevails upon the ground ready to pounce upon the locust eggs, it is no wonder that the female locust instinctively avoids such localities in ovipositing.

**HOW TO KILL ENTOMOLOGICAL SPECIMENS.**—A correspondent says the method of killing entomological specimens, by putting them in a glass cylinder closed at one end, and then inserting a wad of tow saturated with ether on closing the other end of the cylinder, is very good; but when putting the insect, especially butterflies, in the tube, it flutters its wings, and so loosens some of the colors. A better way is to put a small bit of chloroform on the insect's head as soon as it is caught, and the effect is that it instantaneously dies. Not even a relaxation of the muscles being perceptible.

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### ALPINE.

**SUCT DOWN.**—Alpine Chronicle, Nov. 10: Work has been suspended at the L X mine until a more powerful pump can be obtained, the heavy influx of water in the shaft making it too expensive to continue the sinking under the present pumping facilities. The miners have been discharged and paid off in full.

**A REMOVAL.**—Alpine Chronicle, Nov. 17: It is reported that the Schenectady (or Tarshish) mine and mill have been sold—either to a San Francisco or a Gold Hill company. It is to be hoped that such is the case, as it is too valuable a property to be lying idle. Parties in San Francisco have been negotiating for it, having had it thoroughly examined by a practical man. It was also recently examined by two well known Comstock mining men from Virginia City who expressed themselves highly pleased with the mine. We are assured that the entire property will be sold to a good company who will energetically work it.

**TIME.**—Times in this county are very dull just at this time, owing to the fact that some of our mining companies are in law up to their ears, and are not doing much work. But we are in hopes that this inactivity will be of short duration.

### AMADOR.

**NEW MINE DISCOVERED.**—Amador Dispatch, Nov. 17: We are informed that Mr. F. Lorrain and others have recently discovered a new mine of excellent looking quartz near the Jackson Gate.

**MONTEICARLO.**—The work of developing the Monte-richard mine is progressing rapidly and the prospects continue to be very flattering. Mr. McNamara & Co. have about finished their contract for sinking, and the shaft is now down about 250 feet below the surface, at which depth they have a ledge of very rich rock three and a half feet thick. They have also about 300 tons of good rock on the dump ready for crushing.

**THE BOSTWICK MINE.**—Mr. H. I. Bostwick brought several specimens of very fine looking quartz rock into the office the other day, taken from his mine at Skoville about a mile from Jackson. The specimens brought are literally full of gold-bearing sulphurets, similar to those usually found in the Coney mine, and a liberal quantity of free gold. The rock was taken out at a depth of 35 feet from the surface, at which depth the ledge is between three and four feet wide, with every prospect of it increasing both in width and richness as the work of sink-ing progresses. There are also several other mines on the same level, all of which prospect well, and would undoubtedly prove to be valuable mines if thoroughly developed. Besides, these mines can be worked on a comparatively cheap scale, being favorably situated as regards water-power, etc. We think some of our capitalists who are "bucking" off their cash in the San Francisco stock boards would find it to their advantage to come up and look at some of these mines.

### BUTTE.

**ORO MINING COMPANY.**—Oroville Mercury, Nov. 16: E. W. Slater, who is driving into the company's ledge, was in town last Monday, and from him we learn that he is 500 feet and has only 125 feet more to blast. The rock has been the hardest ever seen by Mr. Slater. Powder seemed to have but little effect on it. It had to be nearly all drilled out. This was the case for only a short distance. Every few feet they now find a vein of quartz rock, and think, when the end is reached, to find as good a quantity of ore as seen in Butte county. The tunnel has been an expensive one, but great hopes are entertained of its reaching good rock.

**BUTTE CREEK MINES.**—Butte Record, Nov. 17: Work is progressing rapidly on Messrs. Shepard & Co.'s ditch, on Butte creek, and before many days the untold wealth lying in the gravel on either side will be pouring into Chico. Every foot of mining ground in the vicinity has been taken up and formerly located claims are in demand.

### CALAVERAS.

**GARLAND'S MILL.**—Calaveras Chronicle, Nov. 17: The new mill that Mr. Garland has been erecting on his gravel claim in Chile gulch is completed, and the machinery was started up for the first time the other day. Active operations have not been commenced, the starting of the machinery being held in reserve for the purpose of seeing how it would run. Aside from the leaking of the pipe which conveys water to the mill, everything was found O. K. The battery will be set at work in a few days.

**COMMERCIO PIPINO.**—One by one hydraulicists are wheeling into line for the winter's campaign. Veith, proprietor of the mammoth hydraulic on Tunnel ridge, topped his line Wednesday.

**GRWIN MINE.**—No new developments have been made since our last report. The mine continues an average yield of about \$25,000 per month, and the indications met with in the shaft, levels and stopes are highly flattering. The vein is wide, ore good and the working appurtenances of the mine the best that skill and money can afford. The Grwin still stands at the head of the bullion producing mines of California.

**RAIN.**—The heaviest showers of the season fell last Saturday night and Sunday. The ground is now wet deep enough to admit of plowing and the ditch is about full of water. There is nothing in the world to prevent miners and ranchers from working now, barring an occasional case of constitutional aversion to labor, and from this time forward there will be no rest for either the plow or pick.

**DURYEA MINE.**—Operations have been steadily pushed at the Duryea mine since work was commenced a week or two since. The mill is kept constantly running. Eighteen men are employed in the mine and mill, and there are no Chinamen among them. By next Saturday we hope to be able to chronicle the fact that all the hydraulics in this vicinity are in operation.

**QUARTZ MINE SOLO.**—Messrs. Wallace, Ferguson & Early have sold their quartz mine, located at Sheep ranch, for \$108,000.

**MOSQUITO GULCH IRMS.**—The Hortense mine is a new discovery; about 750 feet from 00 feet. A small lot of rock, say about 13 tons, crushed at the San Bruno company's mill, paid about \$24 per ton. L. and F. are still vigorously working the mine. On another ledge, another new discovery. No crushing about 20 feet. Vein, four feet in width. No crushing as yet, but rock prospects well. J. L. Hoy and J. V. Tower owners. Blue Jay is still being vigorously worked and yielding as good ore as ever. A whim is now being placed on the mine. A third interest was recently sold for \$5,000. Present owners—Potter, Rogers and Spaulding.

### EL DORADO.

**THE LOOMIS CLAIM.**—Mountain Democrat, Nov. 17: The E. D. W. & D. O. M. Co. is having a ditch dug and flume built for the purpose of working the Loomis claim on the south side of Texas hill. It will be ready for operation in a few weeks.

**CHURCH-UNION.**—H. S. Morey, at his foundry, is still turning out large and heavy castings for the hoisting works at the Church-Union mine. The improvements at this mine have been thorough and elaborate, utterly regardless of cost, all of which seems to be justified by the yield and prospects. The chief owners are men of great wealth, who seem greatly dated with the success of their enterprise.

**HENRY'S DOGIRON—CARRIE HALL HYDRAULIC.**—The above named company is making extensive and expensive preparations for the coming season. By the construction of one and one-half miles of new ditch and flume, some of the latter being carried at a height of 35 feet, they have added about 40 feet to the pipe pressure,

and Mr. Bradley, the Superintendent, is sanguine of a very profitable winter. For several weeks workmen have been preparing the Placerville M. Co.'s claim south of town for a winter's run. The flumes have been carried up to the face of the bank, and are now completed. At three points powder drills were put in to a depth of about 60 feet and T's excavated. Thursday and yesterday these T's were charged with 345 kegs of powder, each deposit being inserted by insulated wire with a dynamo's electrical machine. Mr. Swan gave the crank a few turns, pressed the "fire key" and the immense mass of superincumbent gravel was pulverized and ready for the water.

### INYO.

**BULLION SHIPMENTS.**—Coso Mining News, Nov. 17: Mr. Taylor, Superintendent of the Enigmatic mine, brought in on Tuesday one bar of bullion valued at \$1,500. On the same day the Rex Montis shipped two bars of bullion valued at \$1,000.

**MINIATURA.**—A quarrel of some sort among directors, stockholders, or somebody else, in regard to Miniatura, has so far created a little scare relative to their financial standing, but we are assured that the company will set things all to rights, money having been negotiated for sufficient for all present demands.

### LAKE.

**GREAT WESTERN QUICKSILVER CO.**—Napa Register, Nov. 17: Some 225 men, mostly Chinamen, are employed by the company; 120 tons of ore are reduced per day, and from 500 to 600 flasks of quicksilver are bottled every month. Mr. Rocca, Superintendent, has lately introduced a new condensing power, which will be known as the Green, Halsey and Rocca condenser, and for which they have applied for a patent. Under its present management, during the last year the company has paid off all its debts, made \$20,000 worth of improvements, and disbursed a \$30,000 dividend. The monthly pay roll foots up \$10,000. In the vicinity of the mine there are 20 or 30 families living in as many costly constructed houses or cabins, and a school numbering 24 scholars is taught by Philip Ackey. A well-stocked store, owned by the Superintendent and Secretary, is patronized exclusively by the employees of the company, the prices charged always being the lowest market rates. A great quantity of rice is consumed by the Chinamen employed; the storekeeper saying that he reckoned the consumption of that article at one mat (50 pounds) to the man every month. The storekeeper is assisted by a Chinaman clerk. There is no cessation of work at the mine, there being two shifts of men, one for the day and the other for the night; Sundays as well as week days. The fires of the furnaces are never allowed to go out, and every man is to be found at his post with the regularity of clockwork.

### NEVADA.

**BLAST.**—San Juan Times, Nov. 17: The American mining company, near Sebastopol, set off a blast of nearly 500 kegs of black powder a few days ago, which did immense execution. They have recently struck a vein of very rich gravel, and the mine is looking much better than it did when the company was working among the boulders. The members of the company are feeling quite cheerful, which denotes that they are prosperous.

**NEW ENGLAND.**—Nevada Gazette, Nov. 17: This company are putting in a run of five stamps in connection with their hoisting works. This will effect a saving of at least \$2 per ton and practically make their rock richer by that amount.

**THE Nevada gravel mining claim, in the vicinity of Sugar Loaf, promises to be a good thing for the stockholders. This claim, formerly owned by Amos T. Laird, was partially developed years ago, but owing to circumstances, not known to us, work was suspended till last summer. A joint stock company was formed and the old works were reopened. The Superintendent, the Superintendent, has been pushing the work vigorously up to the present time. We are informed that the channel has been reached and that the prospects are exceedingly favorable. There is no reason to doubt that as rich deposits of the precious metal will be unearthed as were found in the Nebraska and Live Oak claims.**

**GRASS VALLEY.**—Bar Mills, Grass Valley Union, Nov. 17: Tuesday last an important transaction took place; important to the mining interests of Grass Valley. The Rocky Bar mining company's ground has changed hands by that transaction. The capital stock of the company is divided into 11 shares, and nine of these have been sold to parties in Grass Valley for \$2,000 per share. The mining ground of which the control has thus been changed is situated on the Messinguer and Merriam hills, famous hills in former times for their richness in quartz, and has been known generally as the Chavanne ground. The new owners, Kelly & Co., will put machinery at work in a very short time. The Rocky Bar ground has a splendid history, and of late very rich ore has been taken out of it. A working miner, who knows all about the present condition of the Rocky Bar, says the late purchase was like buying good ground for a mere song.

**MINE SOLO.**—Nevada Transcript, Nov. 15: Geo. W. Smith has sold his valuable quartz mine to a wealthy San Francisco company, and it will hereafter be under the superintendence of Mr. Amroho. The company has been incorporated under the name of the Royal mill and mining company, with a large capital. The hoisting works will be taken down from the present place and moved 100 feet from the old location. It was for a mere song necessary to make the change on account of the treacherous ground where the old works were situated. The mine is looking splendidly and, in about 10 days, work of the most extensive character will be commenced. We understand the new company propose to buy other properties in this county, if they can find anything that suits them.

**LITTLE YORK MINE.**—Dutch Flat Forum, Nov. 15: The Little York company's mines, at this place, are fitted up, prepared to wash at four different points as soon as water can be had. This company has expended a large amount in putting their mines in readiness for the coming season's washing.

### PLACER.

**MINES NEAR DUTCH FLAT.**—Forum, Nov. 15: The mining companies of Dutch Flat found their various mines in readiness to utilize the first water that passes through the ditch.

**TUE CEDAR CREEK COMPANY** have completed the laying of blocks the full length of the Yankee tunnel.

**NORTH STAN NO. 2** has suspended washing for the present, the supply of water being used in clearing the Gold Run M. D. company's tunnel at Gold Run.

**THE Franklin** is nearly ready for washing.

**A BLAST** of 1,305 kegs of powder was exploded in the Polar Star mine on the 6th instant, doing splendid execution.

**THE work of advancing the tunnel to tap the Hayward mines at Yot** is suspended for the present, owing to the laying of 1,200 feet of flume in it preparatory for the washing season. At the completion of the flume, as mentioned heretofore, the work of advancing the tunnel will be resumed, and the rock removed the entire length of the flume by the mine.

**REYNOLDS HILL MINES.**—The Rhode Island company is busily engaged at present in repairing their ditches and flumes; at the completion of which, if there is not sufficient water for hydraulicing, drifting will be continued until there is.

**BORN TUNNELS** in the Wide West mine have been advanced 525 feet each; the gravel being tapped by them continues to be quite rich. The second drift opened at tunnel No. 2, for the purpose of opening up more ground for breasting out, is advanced 170 feet, at which point the drift is being run north for the purpose of opening out said breasts. The gravel taken out of the old breasts continues to pay splendidly.

**LOWELL HILL MINES.**—The Swamp Angel company have completed the construction of two large water tanks, extended their air pipes, improved the working of the air blast, and resumed extracting gravel one week ago. The tanks constructed are sufficient in size to insure in the future the continuous washing of the gravel as extracted.

**THE East Nevada company's tunnel** has been advanced 600 feet and is being steadily driven ahead.

**No work** has been done in the tunnel at the Wild Cat mine since our last report. The company have been kept busy of late making extensive preparations for winter, in building a blacksmith shop, new residences, and the laying in of a large supply of posts, cises, lagging and wood.

**The tunnel in the Planet mine** is in 450 feet. It will only take about 300 feet more to reach the gravel, when Planet starts, if not contrary to all expectations, will take a sudden rise.

**The tunnel in the Steep Hollow company's mine** is already advanced 170 feet, and is going ahead at the rate of four feet per day.

### SIERRA.

**WATER.**—Mountain Messenger, Nov. 10: The Bald Mountain company have a little water for washing. It is believed that they can wash out money enough to avoid the necessity of issuing scrip. They had 102 men on the last payroll.

**ATTACHED.**—All the property owned by the Pioneer mining company at Grass Flat and vicinity, has been attached by the Bank of La Porte, and will be sold at Sheriff's sale in December.

**PREPARED.**—We are informed that the Pioche company is prepared for winter, and will commence sinking in about two weeks.

### TUOLUMNE.

**THE JONES & WOODMAN.**—Tuolumne Independent, Nov. 17: This mine, situated above Columbia, is being opened by a San Francisco company. New machinery is coming up from below, and it is proposed to put up sulphuric works, condensing, etc., to work the mine at the greatest profit possible. The mine is undoubtedly valuable, and we expect to hear good results as soon as everything is in working order.

## Nevada.

### WASHOE DISTRICT.

**COS. VIRGINIA.**—Gold Hill News, Nov. 21: Daily yield 600 tons of ore. The grade of the ore from all portions of the mine is fully up to the usual high standard, and notwithstanding the street stories about a reduction of the monthly dividends to \$1, the Consolidated will continue to pay her regular \$2 dividends for a long time yet to come. In fact the best judges we have of such matters cannot yet see or foresee any such thing. On the 1200-foot level the ore stopes continue to yield rich ore and to hold their full width. On the 1300-foot level the week has been spent mostly in necessary re-timbering and repairs to the drifts preparatory to opening up the ore bodies left in the southern portion of the mine. On the 1400-foot level the ore body is opening out beyond all expectation. On the 1500-foot level, enlarging the drift connecting the C. & C. and Con. Virginia shafts is going vigorously forward. The ore chutes being put in the south lateral drift on this level, to receive the ores from the 1400-foot level, are completed. The main shaft has been connected with the west drift on the 1650-foot level, and is now nearly ready to hoist ore from that portion of the mine. On the 1650-foot level the ore stopes going southward were never richer or looked better than at this time. The south branch of the main belt drift struck the ore vein last Saturday morning, showing it to be very rich and rapidly widening to the eastward at that point. The 20 additional stamps to the California battery mill were all started into full operation on Sunday last, and the returns for the month are already amply sufficient to insure the payment of the regular \$2 dividend for December.

**CALIFORNIA.**—Daily yield, 650 tons of ore. The ore stopes on the 1400-foot level are yielding their usual quota of rich ore, keeping the mills all busily employed in its reduction. On the 1550-foot level the breasts are showing well and yielding rich ore. The Consolidated shaft is finished to the 1650-foot level, nearly ready to commence the extraction of ore from that portion of the mine. On the 1600-foot level the ore stopes continue the usual yield of rich ore and show well at all points. The north lateral drift, driving to connect winze No. 5 and winze No. 6 is steadily advancing, the face still in good ore. On the 1750-foot level, enlarging and re-timbering the drift connecting with the C. & C. shaft is making rapid headway. The ore in crosscut No. 2 east on this level has shown a very great improvement during the past week. The main south drift on the 1340-foot level is making steady and favorable progress. The 20 additional stamps to the battery mill were started up last Sunday, and are now running steadily. This mill is now capable of reducing daily 425 tons of ore, ready for the amalgamating mills.

**SILVER HILL.**—The north drift on the 400-foot level is steadily advancing along the west wall of the ore vein toward the south line of the Justice at the rate of 6 feet per day. This drift has now but a very short distance to run to connect with the Justice. As soon as that connection is completed and ventilation obtained, crosscutting the ore vein will be commenced. Sinking the main incline shaft is going ahead at the rate of two feet per day, the bottom being in hard blasting rock, and the flow of water giving but little if any trouble.

**JULIA COS.**—The east crosscut from the termination of the main south drift on the 1300-foot level is being steadily advanced through quartz and ore of a fine character that anything that has been found in the mine on that level. The ledge appears to be again concentrating to the east and south of the explorations, and holds out a goodly promise that the long deferred hopes of the Julia stockholders will not prove in vain, and that they will yet be rewarded for their patience and perseverance.

**THE NORTH DUTCH FLAT.**—The pumps have never done more faithful and constant work since they were started than they have for the past week. Everything has worked splendidly and the water has been steadily receding until it is now four feet below the 2000-foot station. The shaft has been put in good repair to that point, and men are now at work doing a little necessary cleaning and repairing to the station. The timbers are all in place and the station is now open considering the length of time it has been submerged.

**YELLOW JACKET.**—On the 2200-foot level the main drift east toward the new shaft has passed through the very promising vein of quartz mentioned in last week's report, and is now in porphyry. Considerable water is met with. The drift north on this same level, running toward the Imperial, has nearly reached the north lode of the Jacket, and the face continues in quartz of a very favorable character.

**ALTA.**—Sinking the main shaft was suspended during the first part of the week to open the 1150-foot station. This is now well under way and a drift started west to cut the ledge, which is now in a distance of 15 feet. Sinking the shaft cannot be resumed until a new station for the pumps is started, which will be accomplished in five or six days more.

**LADY WASHINGTON.**—The shaft is thoroughly cleaned out and put in good condition for active work, and sinking will be resumed shortly. Very little water was found in it, owing to the Justice having assisted in the drainage.

**BULLION.**—The south drift on the 1700-foot level is being pushed rapidly ahead, the face in very favorable quartz of a low grade. Sinking the joint Exchangeer winze below this level, to connect with the north drift from the Imperial on the 2000-foot level, is going steadily ahead.

**OVERMAN.**—The east drift on the 1400-foot level is being pushed vigorously forward, the face in quartz and porphyry mixed. The face of the south drift on the same level is showing fine quartz and some excellent ore.

**WAKO.**—The main shaft was down by actual measurement yesterday 910 feet. The bottom is in a lively, easy-working porphyry. The flow of water is light and gives no trouble.

**SUCCESS.**—Driving the west drift at the 900-foot level is being pushed rapidly ahead to cut the ore vein. The rock in the face is of a good soft and easy grade.

**ORION.**—The face of the east drift on the 1900-foot level is 35 feet east of the ore vein recently encountered and is still in porphyry, carrying occasional streaks of quartz and clay. The drift has been stopped in order to lay track and put in a switch at the junction of the drift with the new ore discovery, preparatory to driving pros-

pecting drifts both north and south on the ore, to determine not only its width but also its character and tendency. So far as the vein has yet been penetrated it is of the most favorable character, and the best experts on the lode are more confirmed than ever in the belief that it will lead either north or south to a large and valuable ore deposit. The main south drift on the same level, which has been suspended for some time, was started up again day before yesterday, and is now being pushed energetically ahead. Cutting out for the incline pump-hub at the 1900-foot station is going rapidly ahead. Sinking the joint Ophir and Mexican winze on the north line is making about two and a half feet per day.

**UTAH.**—The south drift on the 1150-foot level was connected to-day with the upraise from the 1250-foot level of the Sierra Nevada, which, as soon as a little enlarging and cleaning-up is accomplished, will give a good ventilation and an opportunity to begin crosscutting the ore vein on that level.

**JUSTICE.**—Daily yield, 300 tons of ore, keeping the mills all steadily running. The ore vein on the 1000-foot level opening up much better than has been expected for some time past. The prospects now are that this will be the best level that has yet been opened in the mine.

**CHOWS POINT.**—Daily yield, 50 tons of ore, which is being extracted from the 100 and 230-foot levels. Prospecting drifts are still being run on each of these levels, with the expectation of still further valuable ore developments in these portions of the mine.

**SAVAGE.**—The pumps have been doing steady and splendid service during the past week until yesterday, when a little trouble was experienced with a section of the pump-rod. That has, however, been repaired and everything is again working as finely as usual. The water is now reduced to the 2000-foot level.

**NORTH COS.**—The pumps are running day and night and are rapidly draining the water. It is now reduced some distance below the 1150-foot station, and at the present rate of drainage the shaft will be perfectly dry by next Saturday.

**TRONAM.**—The ore stopes and breasts on the 240 and 350-foot levels are looking first-rate and yielding ore enough to keep the Nevada mill steadily running. There is plenty of ore in sight and more could be extracted if required by increased mining facilities.

**GOLD & CUREY.**—The north drift on the 1000-foot level is steadily advancing, the face still in hard blasting porphyry. This drift will reach the north line of the mine some time during the coming week.

**BALTIMORE AND AMERICAN FLAT.**—The northeast drift on the 1400-foot level is cleaned out to the west clay wall of the ledge and will in a very short time be in excellent working condition to the face.

**UNION COS.**—The face of the east crosscut on the 1300-foot level is in a fine character of vein matter and is being pushed steadily ahead.

**CHOLLAR POTEB.**—Daily yield, 35 tons of ore, which is being reduced at the mills as fast as it is extracted.

**THE 1400-foot level** is being cleaned out below the 1000-foot level is going steadily ahead with some very favorable ore indications. Sinking the drain shaft is also making good progress.

**SIERRA NEVADA.**—The connection between the north drift on the 1250-foot level and the south drift in the Utah on the 1150-foot level is completed.

**JOSEPHES AND GEORGE DOUGLASS.**—Considerable improvement has been met with at the bottom of the shaft, a better quality of quartz being cut into.

**SOCIETY COMBOK.**—During the past week 18 feet has been added to the south cross-drift on the 500-foot level, and it is substantially timbered.

**CON. IMPERIAL.**—Sinking the south winze below the 2250-foot level is going steadily ahead.

**1300 FT. TENSEL.**—Total length of tunnel last evening, 13,000 feet. The face of the tunnel continues in good working ledge matter and constant and secure timbering is required.

**NORTH DAYTON.**—Drifting in the ledge from the lower tunnel is actively progressing and some very fair assays are being obtained.

### ELY DISTRICT.

**RE-TIMBERING.**—Pioche Record, Nov. 17: Several wagon loads of two-inch lumber arrived here on Thursday last, it being a portion of the lumber to be used in re-timbering the shaft of the Meadow Valley mine.

**ALPS COMPANY.**—Work is continued as vigorous as usual and about the quantity of ore is coming from the Yerington stoop on the ninth level. The development on the 11th level continues to improve.

**PUMP AND ENGINE SOLO.**—We have it on the best authority that Mr. Taylor, the President of the Rison Iron Works of San Francisco, has sold the engine, pump, and what machinery is left in the foundry belonging to or owned by the Meadow Valley mine, to a mining company of Virginia City. The foundry company had become tired of the waiting process and closed on a good offer for the machinery, for which action we see nothing to condemn, as the Trustees of the Meadow Valley mine could not make up their minds what to do in regard to the pump. The pump of the Raymond & Ely mine can be made, by proper appliances, to drain also the Meadow Valley mine, so that if both companies made the proper arrangements the mines could be worked in common in regard to drainage with very little extra expensio from the cost of working the Raymond & Ely.

**RAYMOND AND ELY MINE.**—Still continue moving down on winze from 1200-foot level; working in comparatively dry ground. Ore continues to be taken out steadily from the upper levels in the usual quantities, no change in the character of the mine during the past week. The mine continues to run on ore and tailings and is doing well in the way of turning out bullion.

### MIAMI DISTRICT.

**LATEST DISCOVERIES.**—Pioche Record, Nov. 17: The latest discovery in the way of mines that we have heard of has been made in the above named district. Mr. S. R. Nichols, mining recorder of Miami district, and who was also mining recorder of Ely district in his palmy days, and the discoverer of the Pioche and several other mines in this district, brought several samples of ore from there the other day of claims in which he is interested, which yielded as follows: Lily May, \$235; Illinois, \$157; Black Bess, \$268. There were also several other assays made, one of which went high up into the hundreds.

## Arizona.

**ARNOLD.**—Arizona Enterprise, Nov. 12: The Arnold company, in Cedar valley, Mohave county, has a shaft down 60 feet, with a crosscut at the bottom. The ledge is 30 feet wide. They shipped recently to San Francisco 17 tons of ore, which assayed \$419 per ton. A mill will be erected on this mine shortly.

**The Tip-top company** has now 45 men at work, and a large quantity of rich ore is being taken out. The Black Jack, about 300 yards from the Tip-top, is showing up very rich.

**For the space of some seven or eight miles square in the immediate vicinity of the Tip-top and Crosscut leads, it would surprise the oldest man in the mountains to see the number of locations that show rich ore on the surface, ranging from \$300 to \$3,000 to the ton. It is true many of these rich leads are small, but they can generally be traced a long distance on the surface and some of them have improved in value and richness. Of course the rich ore mines are not all for prospecting purposes and as rich as any reasonable person could desire. Some of the principal mines have changed their ores as they go down from horn silver, chlorides and carbonate to black sulphurets and ruby silver, which are good indications for permanency. Altogether, from present appearances, the district will be "some" in the near future, and all mine owners here expect their financial troubles to end soon.**

## Idaho.

**FLORIDA MOUNTAIN.**—Owyhee Avalanche, Nov. 17: Much interest continues to be manifested in the operations at present in progress on Florida mountain. Hoist-

## THE ENGINEER.

## American and British Bridge Building.

In an address delivered at a late meeting of the Liverpool Engineering Society, by the President, C. Graham Smith, we find the following contrast: Bridges on the American system have a decided advantage in new countries on account of the small weight of the various portions and the speed with which they can be put together. It is no uncommon circumstance to find American engineers speaking and writing of putting up spans of 150 feet to 250 feet in from two to four days. According to Mr. Lovett, chief engineer to the Ohio and Mississippi railway, the last span of the Medora bridge built for that company over White river, and measuring 147 feet 6 inches between center and center of end piers, was erected by four foremen and 37 men in one day. In England a few weeks more or less for the erection of a bridge is not generally a matter of great moment, but for foreign work speed is often of paramount importance, as the streams which can be walked across dry-shod one day are in the space of 24 hours converted into roaring torrents capable of washing away both the temporary staging and the girders in course of erection upon it. Another advantage of speed in construction in foreign countries is the fact that the new road is often the only means of communication with its own more advanced portions, and until a certain bridge can be constructed it may be difficult to convey materials for the advancement of distant works. There is a further consideration which may even make it desirable to introduce this class of bridge into England, namely, that nearly the whole of the work in the construction is performed by machines, and the erection may be carried on by unskilled labor directed by competent foremen. These are matters worthy of some attention in these days of strikes and inconsiderate and arbitrary restrictions imposed upon labor by various unions. For instance the day's work of a boilermaker allowed by the boilermaker's club can be put in by 12 or one o'clock by a good average man working piece-work. This, of course, enhances the value of riveted work, and it therefore behooves engineers to reduce as much as they consistently can the number of rivets in their bridge designs.

**THE TUNNEL BENEATH THE BRITISH CHANNEL.**—The London *Daily News* says: Operations connected with the submarine tunnel have already been commenced; on the other side of the channel, several pits having been sunk to the depth of 110 yards. At the same time the French and English committees have definitely drawn up the conditions of working for the route. The property of the tunnel is to be divided in half by the length—that is to say, each company will possess half of the line, reckoning the distance from coast to coast at low tide. Each company will cover the expense of its portion. The general work of excavation will be done, on the one hand by the Great Northern of France, and on the other by the Chatham and Southeastern Companies, the two latter having each a direct route from London to Dover. All the materials of the French and English lines will pass through the tunnel in order to prevent unnecessary expense and delay of transshipment, as in England and in France railway companies use each other's lines, and goods can pass from one line to another without changing vans. It is understood that an arrangement will be established for a similar exchange of lines between all the English and continental railway companies when the tunnel is completed. The tunnel will belong to its founders. At the expiration of 30 years the two governments will be able to take possession of the tunnel upon certain conditions.

**UNION PACIFIC BRANCHES.**—General George Crook has been asked by one of the governing directors of the Union Pacific railroad to give his opinion in regard to the construction of two branches from the main line of that road, one from a point east of Sherman, Wyoming, to Roseman, Montana, and the other from Rawlins, Wyoming, to the eastern branch at its terminus in Montana, the eastern branch to pass through the Black Hills, and the western through the Wind river country. The General makes a reply, under date of October 9th, 1877, of which the following paragraph contains the most important passages: "They will have a most salutary and positive effect in settling our Indian troubles, thereby saving large expenditures of public funds. They will invite to and open up for settlement most valuable farming and grazing lands, aid in the discovery of new mining sections, and promote the development of valuable mineral resources already discovered. They will save the public treasury vast amounts in economy of transportation of military supplies, of troops, and mails. From my personal knowledge of the country through which the proposed lines will pass, I regard the project as eminently practicable, and more easily accomplished than many of the works of similar character now in successful operation in the country west of the Mississippi.

**CANADIAN PACIFIC.**—All the Canadian Pacific railway survey parties east of the Rocky mountains have closed operations for the season, and most of them have returned to the capital. Parties employed in British Columbia will cease work immediately and return to headquarters.

## A Plea for Universal Time.

The interest of those who own railroads and steamboats, as well as the interest of the people, requires that they all be run in unison with system and regularity. A writer for the *Railroad Gazette* says: One of the great inconveniences attending an arrangement of this kind is the want of a common, or, as we shall term it, universal time. It will not be necessary for us to refer to any particular place, where perhaps trains come and go by New York, Pittsburgh, Cincinnati, Chicago and local time; the traveling community are well aware of these annoyances, as are also those whose duty it is to make up a time table that shall connect their roads advantageously with others.

And oftentimes when we see a cablegram in the papers, from some foreign country, after considering the dates and figuring on the time elapsed from time of sending to time of receiving, we are not sure but we may be out 24 hours one way or the other.

To obviate these difficulties we will offer the following suggestions: Establish a prime meridian to pass through Bebring's strait, and let the day by local time commence at this line, and also the day universal, but 12 hours later, or when the sun is on this line, the hours of the day universal to number from 0 to 24; and also let longitude be reckoned from this line, numbering from 0 westerly around the globe to 360°, the universal time to be given daily by telegraph to the principal cities throughout the Union by the astronomer at Washington. All schedule time of railroads and steamboats and ocean steamers, as well as official documents and telegrams should be made out in universal

## The Trans-Andine Railway.

The prospect for a railway over the Andes in South America is creating no little interest in England. Some authorities seem to believe that when this work is complete there will be no farther use for our overland roads so far as through traffic between England and Oceania is concerned. Iron thus expresses itself: "Any one referring to the map of South America, and knowing that there is a railway in operation to Rio Quinto, which is nearer to the Andes than the Atlantic, and that the Valparaíso railway has for many years returned a net profit of more than 10% on its traffic between that port and the town of Santa Rosa, at the very foot of the Andes, will appreciate the importance of the proposed railway, as it will unite both lines. We do not anticipate any goods traffic between the Atlantic and the Pacific, nor has this ever been asserted by the concessionaires; but we feel certain that it will promote a very considerable goods traffic between the intermediate stations and the coast on either side. Moreover, the inter-oceanic communication will certainly attract the whole passenger traffic, not only of the Pacific coast, but possibly that from Australia." Thus it appears that even San Franciscans must go to New York via South America. Indeed!

## Prizes for Gas Engineers.

We notice that the Society of the gas industry in France has offered five prizes for 1878, which are as follows:

1. A prize of 2,000 francs (\$400) to the author of the best paper upon economical heating

BOTTLE TREE OF AUSTRALIA.

time. The local publication of time tables for railroads and steamboats, however, should also be made out in local time.

**ASIATIC RAILROADS.**—According to the journal of the Imperial Society of Geography of Vienna, M. Hochstan, President of the society, has recently published a pamphlet on the different projects studied for the establishment of a railroad through Central Asia and China. The following are the four principal routes: 1. The Baranowski project. Saratoff is the proposed point of departure. From here through the country of the Kirghises and over the Hindoo-Koosh mountains. This is the road of greatest travel to Moscow and Peshawur, the principal fortresses of the valley of the Indus. 2. The Lessep-Cotard project. From Orenbourg to Peshawur by Oursk, Taschkend, Samarkand and Balk. 3. The Bogdanowitch project, the principal points of stoppage being Moscow, Kanzan, Ekatherinobourg, Oursk, Tomsk, Irkutsk and Pekin. 4. The Ruthhofen project. This would be along the Siberian route to Oursk, passing Taschkend, Samarkand and Balk. At this point the road leads toward the west, and passes Teheran, and rejoins at Tiflis the Russian roads of the Caucasus, now in process of construction.

**ITALIAN RAILWAYS.**—Considering the state of its finances, the Italian government is courageous in its desire to buy off the three chief companies which now have railways in their hands—the Alta Italia, Romane and Meridionali—and either work them itself on behalf of the State, or farm them out like the tobacco monopoly. There is great merit in State purchase or State resumption of railways if done at the proper time, that is to say, before the dividends have become so large as to encourage unholly greed in shareholders. At present the Italian lines pay an average of a little more than two per cent., and their proprietors would probably prove tractable enough.

of benches by either solid, liquid or gaseous fuel.

2. A prize of 1,000 francs (\$200) to the author of the best paper upon arrangement of pipes, and the means of discovering leaks and repairing them.

3. A prize of 1,000 francs (\$200) to the author of the best paper upon exhausting gas in general, and the apparatus employed for this purpose.

4. A prize of 1,200 francs (\$240) to be divided between the authors of the two best papers presented to the Congress, upon any other subjects than the three preceding.

5. A prize of 200 francs (\$40) to the foreman or workman having the longest and best service in one gas works.

The papers must be written in French, and must be sent to the president of the committee before the 1st of May, 1878.

Any one, whether French or foreigner, member of the Society or not, can compete.

## A Curious Australian Tree.

The "bottle tree" is an Australian tree of the family *Stereuliaceae*. It has the calyx five-cleft, usually colored; no petals; column of stamens with 15 or rarely 10 anthers; stigma peltate, carpels five distinct, with two or more ovules, narrow digitate leaves; paniculate auxiliary inflorescence; flowers unisexual or polygamous, the female flowers expanding first.

The tree has a greatly expanded trunk which is swollen to a disproportionate size. Where the ground is rocky this expansion is greatest just below the branches, but in favorable soils the foot of the tree is largest, forming a uniform cylindrical column from whose summits the branches issue as from the neck of a bottle.

The family of which the bottle tree is a member, embraces many trees valuable for their wood and for their nutritious seeds, the most famous of which is *Cacao*, from which chocolate is derived.

## The River Mining Machines.

Several months ago we gave an account of a new kind of mining machine that was being built on the Feather river for the purpose of mining in the bed of the river. Several times have we been written to regarding it. The anxious question seemed to be, "Will it pay?" We have not answered the question yet, nor do we intend to in this article further than to say that it has not done so up to this time, but on the contrary, has been a very heavy bill of expense to those who have anything to do with it. Mr. J. M. Burt, President of the Main Feather River company, informs us that the one his company built cost over \$10,000, and although the company has been operating it for weeks, it has not succeeded in taking out any gold. As fast as a hole was dug in the river bed it would almost immediately fill up, by the water running tailings and debris into it. The boat will be dismantled this week and taken below the bridge, and either laid up for good or else put to work on the lava beds. The company have lost all faith in it, and do not care to invest more money in such enterprises. No doubt if they were able to find a place where the gold was thickly sprinkled through the earth, and it was covered with water, one of these machines might be of good service in extracting it. There is still another boat or machine higher up the river, operated by the California mining and dredging company, with little or no better success than the one referred to.—*Oroville Mercury*.

It is pretty certain that if these machines did not work satisfactorily this year, after a dry season, when the rivers were lower than they have been for several years, they will never work at all. There was always considerable doubt in the minds of many mining men as to the practicability of these machines, but when those directly interested saw them at work and then invested their money in them, it seemed a great point in their favor. It always looked somewhat chimerical to attempt to go through a mass of debris and tailings with this kind of a machine to get at the bottom of the river, when there was water enough to float the boat over these tailings. The general impression was that the tailings themselves would pay for working in this way, but they would have to be worked on a very much larger scale than by such machines to do this. No doubt if the machines had struck rich spots in the river they could have been made profitable, but the difficulty was to find the locality of these spots and then to get down to the bottom for the gold. The machines have not been successful in doing either, and with the advent of high water in the river they will probably be laid up for good.

## The Destructive Locust of California.

It may be interesting to know that the California grasshopper is a species distinct from that which brings devastation to our prairie brethren, although it does not appear that it is at all deficient in the quality of appetite which is characteristic of the locust family. Indeed our California pest, although it does not come in cohorts sufficiently large to crush us, as the Rocky mountain locust does the prairie farmers, it still has a persistent hunger which leads Prof. Packard to call it *Eutypoda Atrax* or the "terrible grasshopper." In a very valuable report just made by Prof. Packard to Prof. Hayden's Survey, the author gives our California insect a careful review and states some facts of general interest. He says: "To the best of my knowledge, it is the only species of the genus which has anywhere proved seriously and persistently injurious to crops. Several species of the closely allied genus *Pachytylus* have ravaged the fields of Eastern Europe and Asia; and it is interesting in a zoological point of view, to find that California, whose insect fauna bears a much more general resemblance to the peculiar types of the Old World than to those characteristic of the opposite border of the New World, should in this case also harbor a devastating grasshopper so much more nearly allied to the destructive species of the Mediterranean than to those found upon the same continent with itself."

Prof. Packard gives a summary of the facts noted by our local entomologists and by those who have visited our State. Mr. Henry Edwards writes to him as follows: "This species is very abundant in the spring and early summer but at present (1876) appears to be somewhat limited in its range as far as California is concerned. It is found only in our foothills, and has not, to my knowledge at least, been regarded as a very destructive insect. I never saw it but once in very large swarms, and it then appeared to attach itself more to the pasture grasses than to any growing crops; although there were plenty of fields of barley, oats, etc., in the neighborhood. It appears in its larval condition in April, and in the winged state in May, passing entirely out of existence by the middle of June. I have taken it sparingly in Nevada and in Vancouver's island, and have seen some specimens from Santa Rosa island, but I am pretty sure that it cannot be called a common insect in those localities."

The bullion from the Grand Prize mine, which has hitherto been shipped to San Francisco via Elko, now goes by way of Battle Mountain.

## Cinchonas.

As the formerly noted shortage in the supply of quinine material is growing more apparent, and the doctors do not all meet favorable results from experiments with the proposed substitution of other alkaloids, the price of quinine continues very high. This of course serves as a stimulus to attempts to grow the cinchonas in different countries which have a tropical or semi-tropical climate. It appears from our latest advices from the Agricultural Department at Washington that California now holds the forlorn hope of the United States in the successful growth of this tree within its borders. Even in California there seems hope only in our southernmost county, San Diego. William Saunders, the well known superintendent of the gardens of the department, arrives at this conclusion, from his efforts to introduce cinchona, and if any of our friends in San Diego desire to test the growth, we would advise them to address the Commissioner of Agriculture concerning it. Mr. Saunders furnishes the following interesting information on this subject:

"During the past ten years a continuous supply of young plants of several species of cinchona has been maintained by a yearly propagation of young plants equal to the numbers distributed. Plants have been sent to California, and to several of the Southern States, mainly to Florida. The reports that have reached the department do not indicate success in their culture, owing to adverse climatic influences. Experiments here show that none of the species will stand the slightest frost without injury, and even in the equable atmosphere of the greenhouse their vitality is impaired when the temperature is below 50°. Whether or not the climatic conditions for the growth of cinchonas exist in any portion of the country is a question not yet solved, but, so far as our present knowledge warrants an opinion, further experiments should be confined to the locality of San Diego, Cal., as offering greater promise of success than any other point.

"In the recently-formed cinchona plantations in India the best results are said to be obtained in a warm, equable and very moist atmosphere, at elevations where the mean yearly temperature indicates 64°; and in those established in St. Helena, the plants flourish well at an elevation of 1,500 feet above the sea level, in rich lands, bathed in moisture, the mean temperature for the year being 60°.

"Dr. J. E. Howard, of England (high authority in everything relating to the cinchona), in the transactions of the Linnean Society, remarks that 'it must be remembered that these are mountain plants, loving free air and alternate mist and sunshine, while the hot, close atmosphere of the lower valleys is always injurious to their perfection as quinine-producing plants.' It is shown in the reports of the Signal Office that the mean temperature for the year at San Diego is 60°, the highest monthly mean reaching 68° in August, and the lowest monthly mean being that of 53° in January and February. So far as thermometric figures indicate atmospheric temperature, the climate of San Diego corresponds with that of St. Helena, but it is well known that the thermometer alone is not a safe guide in comparisons of this kind; the hygrometrical condition of the atmosphere being of equal, if not of greater, importance as regards vegetable growth. Experience in the culture of several species here confirm the reports that *Cinchona succirubra* is the most robust in growth. This species predominates in artificial plantations on account of its rapid growth."

## Potash in California Marsh Plants.

We learn from the last report of the Department of Agriculture at Washington, that Mr. McMurtrie, the chemist, has been examining some California marsh plants which have been proposed as a source of potash. His conclusions are not favorable to their profitable use in the way proposed, but we find a note or two worth putting on record concerning the composition of the plants. He made an analysis of *Mesembryanthemum Crystallinum* a plant belonging to the natural order *Ficoides*, which is found growing extensively in tide marshes in the vicinity of San Diego. This plant has been used in some sections for food and on the Canary islands it has been burned for the ashes, which it was believed, contained a high proportion of potash. On this account the ashes were shipped to Spain and sold to the glass manufacturers. Mr. McMurtrie remarks that as a food the plant is always used in a young, green state, and necessarily so, for his analysis of the mature plant showed the presence of about 13% of oxalic acid. The analysis also showed 5% of potash and 10% of soda in the air-dried plant. These alkalies, the chemist concludes, from other facts brought out by the analysis, are probably combined with oxalic and phosphoric acids and chlorine.

Another analysis is of the plant *Suaeda Californica*, which grows extensively in our salt marshes and belongs to the natural order *Chenopodiaceae*. It was proposed as a source of potash, but the conclusion is that it shows no superior value in this direction as it contains but about 2½% of potash.

## USEFUL INFORMATION.

## Deposition of Copper by Electricity.

At the American Institute of Engineers' meeting, lately, as reported by the *Iron Age*, Mr. N. S. Keith, of New York, read a very interesting paper on the above subject. The object sought to be accomplished was the obtaining of copper from the mother liquor of a copper sulphate manufactory, the liquors being the result of several solutions of commercial scrap copper containing impurities, the quantity of which in the liquors had increased by the operations until too large to allow the formation of pure, or even merchantable copper sulphate. There were silver, nickel, tin, zinc, antimony and iron sulphates in solution, besides enough copper sulphate to represent 4½% of the total weight of solution as metallic copper. The question was to obtain this copper in a cheap, practical and expeditious way by the agency of electricity. Experiments and computations showed that many of the different cells, such as Daniell's, Brunsen's, Grove's and the gravity battery were too expensive in use. This was the same with dynamo-electric machines, though the cost was much less. Iron, when used in the well-known way, gives copper deposited in a powder, mixed with insoluble basic salts of iron. These considerations led to the abandonment of the idea of using these for the purpose designed.

By a plan which he put into use, iron was placed in less than a saturated solution of sulphate of iron (free from copper) contained in an ordinary porous cell such as is used in various galvanic batteries. The porous cell and contents were placed in a larger vessel containing some of the copper liquor and a sheet of metallic copper. The iron and copper were connected externally to the solution by means of a clamp. In 36 hours the liquor was completely freed from copper, which was deposited upon the copper sheet as a beautiful velvet-like coat, pure, reguline and coherent. Occasional displacements by water of the nearly saturated solution of sulphate of iron formed in the porous cell were made. No formation of basic salts of iron; no copper powder; none of the defects of the ordinary precipitation of copper by means of iron. By means of enlargements and modifications of this simple mode of treatment, any amount of copper solutions may be made to produce fine merchantable copper by inexpensive apparatus at, say, one cent per pound of copper more or less, as scrap iron (which may be placed loosely in the porous vessels) may be worth more or less than \$20 per ton.

## Detecting Shoddy with the Microscope.

We find in the *Manufacturer and Builder* an article by Dr. Adolph Ott, giving a summary of the results gained by Dr. Robert Schlesinger in the detection of shoddy with the microscope. We quote as follows: "If the prepared shoddy is exposed to a magnifying power of 100 or 150, the scaly woolen hair will be seen by the side of the smooth silk thread, or the thick-walled linen thread, or the spiral-formed cotton. The color of these fibers varies generally very much, so that the object gives a very variegated image. After being thus persuaded of the presence of the various fibers, a drop of cupro-ammonia may be added for the sake of confirmation. This destroys silk and cotton rapidly, attacks then the linen and produces at last a swelling of the wool. If to another specimen sulphuric acid is added, the wool is dissolved and forms a red solution."

"After it has thus been determined of what fibers the shoddy consists, the wool must be more closely examined, that is, it is to be determined whether it consists completely or only partly of used hair. To this end, it is first necessary to compare with each other the color, structure and the chemical deportment of the two kinds. With regard to the color the difference is really great. In most shoddy there occurs colored and uncolored wool threads; the latter appear either perfectly white or they exhibit distinct traces of former color removed by bleaching. In the better kinds the colored hairs are only of one color; in the inferior sorts several colors are generally represented. This alone is a strong proof that the threads have not been subjected to one common dyeing operation, but that their peculiar color is the product of a process which they have received formerly in a tissue of their own. All this is not discernible to the unaided eye. Another chief point of difference between the two kinds is to be found in their diameter; the hair of shoddy wool is never regularly formed and lacks the constant diameter of new wool; it grows smaller either gradually or abruptly and grows wider in a deformed manner, in order to contract itself again or to assume a regular form for only a short distance. At some spots it is devoid of scales, at others it is torn, whereby the diameter sinks often below its ordinary measure, and a width of 0.01 millimeter or 0.0003 inch is not rare."

"By the microscope shoddy may be examined quantitatively as follows: Some specimens are prepared with the greatest possible care, whereby the precaution ought to be taken that the single fibers cross each other as little as possible but lie parallel to one another. They are thus ex-

posed to a magnifying power of 20 or 30 times, so that the observer may be able to glance at a large portion at once. He has to note now how many fibers there are of each kind; the numbers furnish the approximative proportions in which the several fibers have been mixed with each other."

**ADULTERATION IN SEEDS.**—The careful and exhaustive examinations of seed grain carried on by Dr. Friedrich Nobbe, at Tharand, as cited by the *London Farmer*, tend to show that it is but too commonly adulterated and tampered with to a far greater extent than is generally supposed. He has succeeded in proving beyond dispute that many parcels of clover and lucerne are systematically mixed with quartz, artificially prepared and colored for the purpose, at specially constructed manufactories. So cleverly are these stony impostures turned out, that it is difficult even for a practiced eye to detect the deception. The frequency with which old seeds are colored, faced, oiled and polished, so as to give them a laudable appearance in the market, is beyond belief even in these days of "commercial morality." The admixture of untreated old seeds, no longer capable of germination, is a comparatively innocent form of swindle as compared with the modern refinements of rascality. The absolutely worthless material in many samples examined at Tharand amounted to 50 per cent. of the whole bulk. Amongst other specimens of the ingenious fraud, it is stated that the seed of the so-called American lucerne (*Medicago maculata*) is adulterated with the dressings of American and East Indian wools, these fleeces containing large quantities of the seeds of the Australian thistle, which are almost undistinguishable from lucerne seed. Hundreds of sacks of this thistle seed are annually imported into Germany for the purposes of adulteration. At the bottom of all this, of course, are the hankerings for "cheap" goods, and the stupidity which will not recognize the fact that the payment of a fair price to a fair-dealing merchant is the surest means of getting value for their money.

## GOOD HEALTH.

## The Hygiene of the Hair.

Prof. Erasmus Wilson, who is probably the highest living authority on the subject, has lately given a course of lectures on the hair before the College of Surgeons in London. They are reported in full in some of the English medical magazines, and an abstract of the more practical portions is given in the *Journal of Chemistry*. Cleanliness is, of course, insisted upon as of prime importance, but washing the hair is emphatically condemned. Brushing is to be preferred, as it promotes circulation, removes scurf, and is in all respects a more effective stimulant than water. Cutting does not encourage growth as much as is commonly believed, but is advantageous in the case of the short, slender hairs generally called "young hairs."

Of the countless applications recommended for the cure of baldness, few are ever successful, and in the occasional instances in which they appear to be useful it is possible that sequence is mistaken for consequence, the *post hoc* for the *propter hoc*. Most of these specifics are stimulants, not excepting petroleum, which has lately been eulogized.

Ammonia is Prof. Wilson's favorite stimulant; it is unlikely to create inflammation and its consequences; it is neither absorbable into the system, nor could it do harm if such were the case; and its odor, refreshing at the moment of its use, speedily evaporates. In a case of ordinary *madecia* or falling out of the hair, he prescribes a lotion composed of strong liquor ammonia, almond oil and chloroform, of each one part, diluted with five parts of alcohol or spirits of rosemary, and made fragrant by the addition of a drachm of the essential oil of lemons. The lotion should be dabbed upon the skin of the head after thorough friction with the hairbrush. It may be diluted if necessary; it may be applied sparingly or abundantly; and it may be used daily or otherwise.

There are cases in which a less stimulating and even a refrigerating lotion may be desired, and where an objection may be raised to the quantity of oil contained in the above. In such cases a lotion of horax and glycerine, two drachms of each to eight ounces of distilled water, is cooling and refreshing; this lotion allays dryness of the skin, removes scurf, and subdues irritability.

In cases of complete baldness, and also in *alopecia areata*, a stronger stimulant application will be required. For this he recommends frictions with a liniment composed of equal parts of the liniments of camphor, ammonia, chloroform, and aconite, to be well rubbed into the bare places daily, or even twice a day, so as to produce a moderate amount of stimulation. In cases of *ophiasis*, due to neuralgia of the cutaneous nerves of the scalp, this liniment is very valuable. In other cases the liniment of iodine may be painted on the bare patches daily, or they may be rubbed with the ointment of caustics or any other powerful stimulant. The intent on all these local remedies is to stimulate without setting up irritation; to increase the energy of circulation and innervation of the part; and in some instances to abstract the excess of fluids from the tissues of the skin by inducing exudation. But these results must be

accomplished as far as possible without pain and without severity.

The constitutional treatment of *alopecia* should consist in the adjustment and regulation of the functions of digestion and assimilation; and, where no other special conditions are to be fulfilled, the adoption of a tonic regimen and the administration of tonic remedies. Of these last arsenic bears the palm, and may be advantageously prescribed in doses of two to four minims three times a day directly after food, and in any convenient vehicle.

Grayness, *canities* or *poliothria* depends like baldness on defective powers of the skin, and the indications for treatment are exactly the same—to strengthen the part and at the same time strengthen the patient.

## A Healthful Food.

*Hall's Journal of Health* says: That macaroni is an article of food which it should like to see in more common use in this country. When people learn to make it, as well as they make it in Naples; and what is equally important to cook it as the Neapolitans do, it will be as much used here as it is there, for it is, or might be, cheap and healthful.

The flour is specially ground for it, and the best article of macaroni is retailed in the Neapolitan provinces for five and six cents a pound. A commoner and coarser article is much used by the common people, which sells for about half this price. It is difficult to imagine what the *basse gente*, the lower classes, would do without macaroni.

Here, we think, it is usually baked with cheese; a style in which no Italian could be induced to eat it. They regard baked cheese as very indigestible. They boil their macaroni until it is tender, which ordinarily requires about 10 minutes and then serve it up with butter or the sauce of the ragout. To make this dish they take a piece of beef without bone, and after cutting an onion into small pieces and cooking it thoroughly in a kettle, they place the meat on the onion, and after it is partially cooked they add tomatoes, prepared as they would be for stewing, adding more from time to time and sometimes water and cooking for three or four hours. The meat is then served up by itself and the tomato sauce is poured over the macaroni. They always have some grated cheese on the table to be sprinkled on the macaroni by those who like it.

Twice a week, Sundays and Thursdays the year round, this forms the dinner for four-fifths of a population of 8,000,000 people. It is both healthful and inexpensive.

**THE SANITARY USE OF TREES.**—A correspondent of the *American Architect* calls attention to a phenomenon which he has observed in the outflow of waste from his own house. He has a close-built brick cesspool eight feet in diameter and eight feet deep, with an overflow thence for liquids into a percolating stone cesspool 10x10 feet; both are domed over at the top, closed each with a flat stone, and covered with soil. Unlike his neighbors, whose cesspools are constructed in the same manner and in the same kind of soil, but who are subjected to the necessity of cleaning out both cesspools at frequent intervals, his own have been in use for four years without being opened, and have given him no inconvenience. A few months ago a deep excavation in the street near his percolating or overflow cesspool revealed the fact that the moisture from it was all absorbed by the roots of three large and very flourishing trees, a tulip and two maples, in its immediate neighborhood. "There could be no accumulation of water," he says, "where there were such channels to draw it up." This certainly is an important point to be considered in locating the area of absorption for household waste. We do not remember to have seen elsewhere noticed this very probable sanitary function of trees; but if the theory is correct, it goes far to solve the most serious difficulty in the problem of drainage without common sewers.

**TO STOP NOSE-BLEED.**—A correspondent of the *Druggist's Advertiser* says: The bleeding may arise from an impoverished state of the blood, or it may be the symptom of some other disease. If the attack gives rise to serious apprehensions seek the advice of a physician. At times simple remedies relieve great ills, and perhaps a knowledge of the following simple remedies might prove serviceable: Bleeding may be stopped by raising the arms above the head. Sponging with ice-water the forehead and face. Applying a towel wet with cold water between the shoulders. Application of a strong solution of alum to the inside of the nostrils, or plugging the nostrils with lint or cotton wool soaked in this solution. Placing a small roll of paper or muslin under the upper lip, above the front teeth, and pressing firmly on the same, which by compressing the arteries, checks bleeding.

**SUNSHINE.**—Seclusion from sunshine is one of the misfortunes of our civilized life. Potato vines grown in a cellar are white and sickly, and so are girls grown in a parlor. Expose either to much sunshine and they begin to show color, health and strength. During those dreadful years, '49 and '51, I saw at least five cases of cholera on the shady side of the street to one on the sunny side. This was in Buffalo, N. Y. An eminent physician reports from his practice in New Orleans eight cases of yellow fever on the shaded side of the street to one on the sunny side.—DIO LEWIS.

## The Week.

News of increasing activity in mining matters comes to us from all directions, more particularly, however, from the gravel mining regions of California. The ground is now pretty thoroughly saturated, and the water commencing to flow at a lively rate. The quartz mines are all doing well also. The bullion product of the principal quartz mines for October aggregated \$4,579,000. Arizona comes to the front for the first time this week in the San Francisco market, with a fifty cent dividend from the Silver King mine, recently listed on the stock board here. This, we hope, is but the first of many dividends from that country where so much rich ore is found on the surface, and the ledges commence paying from the grass roots. From the Comstock comes the cheering news that they have at last succeeded in getting the water in the Savage 18 inches below the 2,000-foot level, and three feet lower than that in the Hale & Norcross. The water has stayed at the 1900-foot level so many months, notwithstanding all exertions, that it looked as if they would never get ahead of it again. The deepest point attained in the Savage is some 200 feet lower than the 2200-foot level, while in the Hale & Norcross it is about 100 feet lower. But all the water below the last named level is dead, the mines having been flooded by water which broke into the north drift on the 2200-foot level of the Savage. The latest news from Ophir is that the whole face of the 1900-foot lateral drift, south of cross cut, is in ore assaying over \$90 per ton. It is to be hoped another bonanza will be developed, but there are so many stories it is hard to believe any of them.

## The Mining Laws.

### Points of Interest to Miners.

We have received from a subscriber in Nevada a letter asking a number of questions relating to the mining laws; the answers to which he says will be of great interest to many miners in his locality and probably elsewhere. We append the questions, and have answered them as we understand the matter after a close examination of the U. S. mining laws and various decisions of the Commissioner of the General Land Office and Secretary of the Interior. It is as well to premise, however, that many questions are still open, and it will necessitate a legal controversy to have them settled definitely by the courts. Until they are so settled they are open to discussion, and different men will differ in opinion concerning them. We do not profess to be infallible in legal matters, but have answered the questions propounded to the best of our ability after an examination of the laws:

I. In locating a claim in any district in the State of Nevada, where there is a District Recorder, must the claim be first recorded in the office of the District Recorder, or will it hold if it is only recorded in the County Recorder's office? Record of location notices, in the absence of a District Recorder, should be made with the proper Recorder of Deeds for the county wherein the claim is situated. The instructions of the Commissioner of the General Land Office say that within a reasonable time, say 20 days after the location shall have been marked on the ground, notice thereof, accurately describing the claim, should be filed for record with the proper Recorder of the district, who will thereupon issue the usual certificate of location. The only reasonable construction of this language is that the record must be made with the proper Recorder of the district, who is, of course, the District Recorder. In case there is no such officer, then the location may be recorded with the County Recorder. It has also been decided that, in the event of a mining claim being situated outside of any regularly constituted mining district, recording can be dispensed with. In this case, an affidavit of the fact should be made, and secondary evidence of possessory right will be received, which may consist of the affidavit of the claimant, supported by those of any other parties cognizant of the facts relative to the location, occupation and possession of such claim, and any deeds, certificates of location or purchase, or other evidence which may be in the claimant's possession or tend to establish his claim.

II. If two different parties locate the same claim and record it, one in the district office and the other in the county office, which is valid? Probably the one is valid that is recorded in the district office.

III. If both are valid, does priority of location carry the title? This question is answered in the previous one.

IV. Which date determines priority; is it the date of the notice or the date on which the notice is filed? There is no doubt whatever that the date of the location notice decides priority of ownership, and not the date of filing the notice with the Recorder. In the instructions of the Commissioner of the General Land Office, relative to the manner of locating claims on veins subsequent to May 10th, 1872, in speaking of the necessity of finding the vein within the limits of the claim located, the following paragraph appears: "The claimant should, therefore, prior to recording his claim, unless the vein can be traced in the surface, sink a shaft or run a tunnel or drift to a sufficient depth therein, to discover and develop a mineral-bearing vein lode or crevice; should determine, if possible, the general course of such vein in either direction from the point of discovery by which direction he will be governed in marking the boundaries of his claim on the surface, and should give the course and distance as nearly as practicable from the discovery shaft on the claim, to some permanent well known points or objects, such, for instance, as stone monuments, blazed trees, the confluence of streams, points of intersection of well known gulches, ravines or roads, prominent buttes, hills, etc., which may be in the immediate vicinity, and which will serve to perpetuate and fix the locus of the claim and render it susceptible of identification from the description thereof given in the record of locations of the district." Then, within a "reasonable time," the notice must be filed for record. The location notice must, therefore, decide the priority of titles, not the date of filing; for if it were otherwise there would be endless trouble by persons entering fraudulent notices for record, while the real owner was at work developing his claim; and if the record notice indicated priority, these men would have the best of it.

V. If a ledge should have appeared on the surface in several places, that is with stringers or feeders running out from it, does the law give the lode at the point of junction to the older location, or to the one located on what is the main ledge? Section 2,336 of the Revised Statutes reads: "Where two or more veins intersect across each other, priority of title shall govern, and such prior location shall be entitled to all ore or mineral contained within the space of the intersection; but the subsequent location shall have the right of way through the space of intersection for the purpose of the convenient working of the mine. And where two or more veins unite, the oldest or prior location shall take the vein below the point of union, including all the space of intersection."

"Weeks on Mineral Lands" takes the ground that the construction which has been given to this part of the law is that a party has a right to a patent for the number of feet along his lode or vein to which he has the local title, upon full compliance with the law and instructions; provided, however, that where another lode crosses, the one at the space of intersection belongs to the one who owns the prior location of the two, whether patented first or second. Of course until two lodes have been developed it cannot be ascertained with certainty that they are one and the same. If the same, the law provides which has the better right as stated; but it has been customary for the burden of proof to rest with the original locator. For instance, if A takes up a claim which B, the original locator, thinks is a stringer from his claim, it rests with B to prove that A is trespassing on his property; and A can work the ground until, by following up the lead, B proves it is part of his vein. The bare possibility that two lodes which are separate and distinct on the surface, may subsequently converge so as to form, at some indefinite distance underground, one and the same lode, is not sufficient basis for an adverse claim, nor for a protest against the issuance of a patent. It would not be expedient, says the Secretary of the Interior, to carry any such vague and undeterminable question as this into the courts, for the reason that until sufficient exploration and development have been made to establish the fact that the lodes unite and are identical, the judgment in view of the developments of one day, might be reversed by the same tribunal, by other developments, the next. Such a construction of the law would suspend the disposal of mineral lands until the attempted adjustment of hypothetical controversies. Besides, under the law, if lodes are found to unite (the question of size of either lode not being entertained), the parties who have the prior location and a patent are as fully invested with title to the lode beyond the point of union, including all the space of intersection, as if the other claim had not been patented.

In commenting on Section 2,336, it has been remarked that it appears to be plain, but when applied to the facts in mining cases, and when compared with a section giving all the veins within his lines to the locator, and especially when involved with different degrees of title (patented against possessory), or to the case of several overlapping patents, it may be found ambiguous. In Morrison's "Mining Rights in Colorado," it is sensibly stated that "The leading idea of the act is, that a lode is a straight vein whose course can be readily ascertained and indicated by a straight line or a series of straight lines, and that occasionally such a vein is crossed by another in a similar straight line, merely requiring the right of way to give each lode its proper claim; but, in fact, a lode is scarcely ever a straight line, and is seldom to be traced without confusion for more than a few feet, and in its course other veins are absorbed into, and offshoots, not only spurs, but perhaps better developed veins than itself run from it in all tortuous directions; and in its extension downwards, it invariably dips laterally and often shows a fork, of which both parts approach the surface; and it will divide, and may or may not unite at another point; and it will about suddenly upon country rock, and so be thrown far to one side; and, instead of showing distinct lines, mineral veins are as irregular, as disproportioned in length and width, as uncertain to segregate from each other as are the skins of the hand or veins in a block of marble. It is as the result of these natural facts that the same lode is so often claimed at various openings by as many sets of claimants, by equally honest and valid or invalid locations. If this irregularity were admitted in one case, the remedy would be obvious, but the practical difficulty consists in compelling such admission; the question whether two claims are upon the same or separate veins, or whether there is a junction or crossing, is always a disputed fact upon which parties will stand and witnesses will disagree."

VI. Does the United States patent issue to the original locator; and if so, does a quit claim deed, vest the right and title to the claim in the holder of said deed without transfer? The United States patent does not necessarily issue to the original locator, but to the real owner of the mine. Patents are issued to the parties named in the Register's certificate of entry. In applying for a patent the claimant must swear that he has the possessory right to the premises described, "in virtue of a compliance by himself (and by his grantors, if he claims by purchase), with the mining rules and regulations of the district in which the claim lies and with the mining laws of Congress." The affidavit should be supported by appropriate evidence as to possessory right, viz.: "Where he claims to be a locator, a full, true and correct description of such location should be furnished, as it appears on the mining records," etc. Where the applicant "claims only as a purchaser for valuable consideration, a copy of the location record must be filed, under seal or oath, with an abstract of title certified by the proper Recorder, tracing the right of possession by a continuous chain of conveyance from the original locator to the applicant." As far as the Government is concerned it makes no regulation as to the nature of the conveyance from one party to another. An ordinary bargain and sale or quit claim deed will stand as a conveyance of mining property in any court or

before the Commissioner of the General Land Office.

The real owners of the mine having also the possessory title to the lode are the persons to whom it is proper to deliver the patent, notwithstanding that they may not be the parties named in it as it was originally made out.

If any conveyance has taken place after the original applicants have commenced proceedings for a patent, but before the entry is made at the local office, the Register's certificate and Receiver's receipt must be made out in the name of the grantee. Upon filing a deed in the General Land Office, the Register and Receiver will be instructed so to make out the certificates and receipts. If, however, the transfer takes place after the date of entry, an endorsement should be made in the duplicate receipts by the applicant, assigning all right and title in the premises described. The patent will then issue in the name of the grantee. Transfer of interest from the original locators to the applicants must be shown by abstract of title. The patent can therefore issue to the assignee of a party making the entry.

VII. If the claim is transferred by a quit claim deed before the U. S. patent is granted to the original locator, can he, the original locator, take out a U. S. patent in spite of such transfer? He certainly cannot. This question is partly answered in the foregoing answer. The grantees have in such case simply to file a deed from the original applicants for the patent (they having sold after proceedings for patent were commenced) and the Register and Receiver will be instructed by the Commissioner to have the certificates and receipts made out in the name of the grantee. It is even decided that a patent will be delivered, under some circumstances, to parties who satisfactorily show that they have the possessory title to a lode, even though such patent was made out in the name of others.

## Expensive Plodding.

We are told by Messrs. Morey & Sperry, of New York, who are building improved mining machinery, that they find in their travels in Colorado an immense wastage of time, power and wear of machinery for the lack of knowledge in running stamp mills. They found in one instance stamps running on decomposed (soft) ore at 19 drops per minute, with 12-inch drop; whereas, six inches fall and 80 drops per minute would have accomplished four times the work. On the contrary, a neighboring mill, on very hard ore, was set with eight-inch fall and making 60 drops, crushing only one-half of the average of California stamps. On the same kind of ore a mill erected by Morey & Sperry, running at 90 drops a minute, averaged 18 tons per stamp, with 60 mesh screens.

The amount of fall and rapidity of drop of quartz mills for different grades of ore is worthy of more careful experiment by mining men generally. A free discussion of the matter in our columns would result in great good, no doubt, to both readers and writers. When the mining department of the State University is thoroughly organized, this matter ought to be investigated, as there seems to be no chance of the Government ever instituting a course of experiments in metallurgy. It would, however, pay the Government handsomely by increased prosperity among the mining classes of its citizens, now a very large one.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from the prominent mines have been as follows: Northern Belle, Nov. 16th, \$4,856.74; Leopard, 15th, \$4,800; Alps, 16th, \$4,689; Tybo, 13th, \$8,250.86; Martin White, 5th, \$17,647; California, 17th, \$208,896.61; Con. Virginia, 17th, \$146,277.07; Standard, 12th, \$34,167.32; Northern Belle, 14th, \$4,692.36; Arizona, 15th, \$1,549.63; Arizona, 17th, \$715.12; Tybo, 15th, \$3,979.92; Manhattan, 12th, \$12,735.66; Manhattan, 18th, \$12,178.85; Endowment, 17th, \$2,350.50; Martin White, 15th, \$18,647.41; Grand Prize, 19th, \$20,700; Alps, 19th, \$3,849; Northern Belle, 17th, \$5,138.36; Leopard, 19th, \$3,300; Alps, 20th, \$1,976; Tybo Consolidated, 17th, \$3,834.

**RICKARD'S** patent oxidizing and chloridizing furnace, for roasting ores prior to leaching or amalgamating them, is a new invention recently introduced. One of these furnaces is now being erected by the Aztec G. & S. M. Co. at their mill in Aztec district, Santa Rita mountains, Arizona. A model and drawings of the new furnace may be examined at the office of the Aztec mining company, 302 Montgomery street, rooms 14 and 15, and miners interested in furnaces will do well to look at them.

**INFORMATION** wanted of Elijah Morse, an old gentleman who was reported to have died somewhere in California about a year ago. He has relatives living in Clayton, Michigan, who are anxious to hear from him. Any information sent to this office will be forwarded to his friends.

The big air pipe of the Savage mine is 1,300 feet long, 20 inches in diameter, and made of galvanized iron. This takes the place of the old wooden boxes formerly used for conveying the air.

NEXT week we shall illustrate a combined bird cage and fish aquarium, an ornamental and useful device for a holiday present. The illustration is unavoidably deferred this week.

## HYDRAULIC MINING IN CALIFORNIA.\*

No. 7.

(By A. G. J. BOWIE, JR., A. E., Mining Engineer.)

## The Supply or Feed Pipes.

The water is conveyed to the claims in iron pipes from the pressure box, and by means of iron distributors on the lower end of the feed pipe is distributed to the discharge pipe as required.

The pressure box should be strongly built, and the water supplied in sufficient volume to keep the top of the pipe covered several feet. A grating on the end of the flume, which connects with the box, prevents the entrance of foreign material, such as sticks, leaves, etc. The pipe is of uniform diameter down to the distributor, except where it enters the pressure box. Here it swells to a funnel-shape, connecting at its greatest diameter with the box. The size of the feed pipe is determined by the head and quantity of water to be used. The thickness of the iron of which it is constructed varies with the diameter of the pipe and according to the hydrostatic pressure.

As it is not desirable to alter the position of the main feed pipe often when in place, it should descend in the most conveniently direct line into the diggings, avoiding as far as practicable all angles, rises and depressions. Air-valves, with floats or such valves as will open and close automatically, should be arranged at proper points to allow the escape of air when filling the pipe, and also to prevent any collapse from atmospheric pressure should a vacuum occur.

Where the pipe passes over steep banks into the claim it is carried on an incline trestle and braced, care being taken to prevent any movement or sliding of the column.

When necessary, the pipe is secured with frame-work and weighted with stones. At the bottom of this incline, where it reaches the bedrock or level of the workings, it is securely braced and weighted.

A distributing gate (made of cast-iron into which the supply pipe is led and from which one or more branches can be taken as wanted by means of valves) is generally placed at this point. In some claims double distributing gates are used, in others the main pipe is here forked by means of a breeching having two branches, and a distributor placed on each branch. The branch pipes (generally 11 and 15 inches in diameter) connect direct with the discharge nozzles.

The annexed sketch shows the form of a single "distributor" used in hydraulic mines. This style of distributor is also used as a discharge gate for reservoirs.

In filling the feed pipe the water should be turned on gradually, all sudden straining of the column being thus avoided. Any leakages in the slip joints can be readily stopped with the assistance of a few bags of saw dust and by wedging them with thin pieces of soft pine.

## The Discharge Pipes.

The discharge pipe most generally used is called the "Little Giant."† It is portable and easily handled, having a knuckle-joint and lateral movement. The "Giants" have stream concentrators, and the nozzles used are from 4 to 9 inches in diameter, 5½ to 7-inch nozzles being those most generally in use. The number of "Giants" employed in a claim depends on its size and quantity of available water. There are generally two or three used in a claim.

The annexed sketch (Fig. 1) shows the general form of the Little Giant. Fig. 2 represents a Monitor hydraulic machine with a "deflecting nozzle," the invention of Mr. Henry C. Perkins, Superintendent of the North Bloomfield mining company.

By means of the "deflecting nozzle" the Giant can be turned to any point and the stream issuing from the pipe can be directed with the greatest facility. Its workings will be easily understood from the following explanation: A, cast-iron nozzle. B, deflecting nozzle of wrought sheet-iron, attached to A by a joint similar to a compass gimbal. C is a lever to govern the movement of B. D is a rest for lever B. The operation is as follows: When the lever, C, is in the rest, D, the deflecting nozzle, B, allows the stream of water from nozzle A to pass through without obstruction. To move the pipe, either to the right or left, or up or down, the lever is taken from the rest and thrust in the direction in which it is desired to throw the stream. This throws the deflector, B, into the stream of water, and the force of the water striking it moves the entire machine. The joint attaching B to A being a universal joint, the nozzle can be turned in any direction.

## Storage Reservoirs.

When water is not taken from running streams the mines are dependent for their supply on the winter rains and snows. Large reservoirs are built to catch the water from the rains and melting snows, and store it in the spring and summer months for use during the dry season.

The North Bloomfield company has established a complete system of storage reservoirs. The Bowman reservoir, and the small reservoirs about it, will hold, when the main dam is completed to a height of 96 feet 3 inches, about 1,000,000,000 cubic feet of water. The cost

of the reservoirs and dam to date is \$214,392.06.

The Rudyard reservoir, of the Milton company, contains 535,000,000 cubic feet of water or 3,980,000,000 gallons. Their reservoir is formed by three dams; highest, 100 feet vertical, and its cost was \$150,000. The storage reservoirs of the Eureka Lake and Yuba Coal Company, consisting of the French, Weaver Lake and Faucherie reservoirs, have an estimated aggregate capacity of 819,800,000 cubic feet of water. Independent of these reservoirs, all mines at a convenient distance from their works have what are called distributing reservoirs. From these places water is easily distributed to the claims, or they are used to retain the sur-

high water area 328 acres; catchment basin, 5.10 square miles.

All the foregoing dams are built of dry rubble stone and faced with a water-tight lining of plank. The Tuolumne County Water Co. has several large dams built of timber cribs. The largest dam built by this company is across the south fork of the Stanislaus river.

It is over 60 feet in height and 300 feet wide on top (across the stream), forming a reservoir with 300 acres high water area. Its catchment is of large size, and great freshets pass over the dam. The dam is at an elevation of about 8,000 feet above the sea level.

It is built of cribs of round tamarac logs from two to three feet in diameter, and with no stone

place. The total cost of the dam did not exceed \$40,000.

Pine dams, owned by the same company, constructed on the same plan, have decayed; while cedar cribs are still in perfect order.

The Spring Valley Company's Concow reservoir is formed by two earthen dams, each about 55 feet in height; one of these dams, which is used as a waste, has its lower side built of heavy brush, embedded in the earth.

The catchment basins of most of these reservoirs embrace bare mountain slopes and valleys, and in ordinary seasons from 60% to 80% of the rain and snow fall flows into the reservoirs.

\* These details were received from Mr. Dobie, who for many years had charge of the reservoirs and ditches of the Tuolumne County Water Co.

## Mistakes in Mining.

We see by the *Coso Mining News* that the Modoc furnaces have been shut down by Mr. Guptill, Superintendent, in consequence of the ores having assumed so "dry" a nature that it is impossible to smelt them at a profit. A mill is now demanded before the Modoc can hope to place itself on a paying basis. "When ores can be milled for \$10 to \$12 per ton it is worse than folly to smelt at an expense of \$30 to \$50 per ton."

This must be interesting news for the stockholders who have bought into this company in hopes of making anything out of bona fide mining operations. Of course those who intended doing nothing more than dabbled in the stock found out what was coming before and have probably dropped their stock before the announcement of a proposed change in the metallurgical operations. The *News* says that "there are dry ores enough now on the dump and in sight to pay for a 10-stamp mill, and this, with the amount to be raised by the present assessment, will be quite sufficient to pay for the mill and the removal of works to the proper sites."

We do not exactly see, however, how this milling ore on the dumps and in sight is going to pay for a mill before it is milled, and therefore conclude that another assessment will be levied as soon as the present one is paid. At least that is the natural conclusion. Moreover, in such cases, where a mill is to be built, there always is ore enough in sight to pay for it, but the money has to be forthcoming to pay for the machinery for it.

When the new mill is up and the works removed to the proper sites the *News* says there will be a clear saving of \$10,000 per month now paid for packing ore, coal, wood and other supplies up hill and hauling down hill. The fact of the business is, says the local journal referred to: "No one but a lunatic would have located smelting works where they are at present, when there existed the finest chance in the world of building chutes and carrying the ore down to the works by their own momentum. If the present directors are business men and care anything for the future of their property and the interests of the stockholders they will certainly indorse the action of Mr. Guptill, and at once give orders for the mill and the removal of the works down to the tunnel level."

It would be well for the stockholders of this company to carefully hear in mind the name of the Superintendent who put the works where they are, and also of those in authority at the time the work was done, and be equally careful never to have anything to do with any company in which any one of them is concerned hereafter. There are sins of commission and of omission, and if the superintendent did not know that it was cheaper to send things down hill than up, the directors ought to have looked out for some one who did. They must certainly find it easier for a company to go down hill than up under some circumstances.

The truth of the matter is, people are too apt to trust their interests, involving large outlay in mining operations, to incompetent and ignorant persons. They let the principal stockholder choose some relative or friend for superintendent, and then invest their money without inquiring further concerning him. This is all wrong. If sensible men get into a company which they see is mismanaged, and they are unable to prevent it, they get out as soon as possible. But the great majority never see the mine, never know the superintendent, and take everything for granted. Then it happens that smelting works are put up for milling ore, or mills for smelting ore; works are put up on a hill instead of below the mine, or placed too far from mine and water, and the result is a crop of assessments instead of dividends. Much of this could be prevented by employing competent mining engineers, not interested in the company, to make a thorough examination and abide by their reports. But when money is invested in undertakings of this character on the report of some pretended expert with more geological terms on the tip of his tongue than knowledge of geology in his head, the projectors are apt to come to grief.

A London mining paper, in referring to the millionaire miners of the Pacific coast, says: At a time when mining is so much decried in certain quarters, it is well to point to the fact that the majorities of the millionaires of to-day in the United States have been, or are, miners.

SECTION OF DISTRIBUTER.

plus coming from the main ditch when the claims are shut down.

## Dams.

In California the rainfall from the first of May to the middle of October is inconsiderable, and hence, in order to secure a permanent supply of water for the hydraulic mines, it has been, in

filling. The cribs are about eight feet square from log to log (say 10 feet center to center), and the timbers pinned together by wooden tree nails. The dam rests for its entire base on solid granite bedrock. The angle of face with horizon is 50°.

The face is formed of flattened eight-inch

"MONITOR" HYDRAULIC MACHINE WITH DEFLECTING NOZZLE.

many cases, necessary to form large reservoirs, in which water is impounded during the rainy season, or while the mountain snows are melting, and which is used to supply the mines during the dry months.

Large dams of earth, timber or stone have been constructed to form the storage reservoirs. Among the most considerable dams in the State are the Bowman dam, height, 100 feet; catchment, 28.94 square miles; three dams owned by the Milton Mining and Water Company, forming the English reservoir; the largest of these dams having a height of 131 feet from the deepest portion of its foundation to its summit; this reservoir impounds 618,000,000 cubic feet of water, has a high water area of about 395 acres and is fed from a catchment basin 12.10 square miles; the cost of these dams has been about \$150,000; the Fordyce dam of the South Yuba Canal Company, height, 60 feet, costing about \$160,000; catchment basin about 40 square miles; the Eureka Lake dam of the Eureka Lake and Yuba Canal Company, height 68 feet, storage capacity 630,000,000 cubic feet;

timbers, pinned with wooden tree nails to the crib, and calked with cedar bark. The flood water passes over the crest of the dam for its entire length.

The Little Giant. (Hoskin's patent.)

Fig. 1.

Section along line c, showing the rifles.

The water is drawn off by several gates, one above the other, placed on the inclined water face. When a gate is opened the water flows directly into the interstices of the crib.

The dam was built in 1856, and has needed no repairs. Large derricks lifted the logs into

## Instruments of Precision.

(Read before the California Academy of Sciences, November 5th, 1877, by PROF. GEORGE DAVIDSON.)

In a former paper, I called your attention to the geodetic instruments of precision used in Europe and in the United States, stating the objects to be kept in view in their construction, and pointing out the principal features of excellence and of weakness. Before referring to that fundamental instrument upon which geodetic work must rely for its accuracy, I cannot refrain from mentioning one or two of the foremost reasons for the slow progress made in approximating a perfect field instrument. In all geodetic work, portability, accuracy and maintenance of adjustment are essential to rapidity of progress and precision in the results. To attain these, it is demanded that the following conditions, at least, be fulfilled: Simplicity of design, fewness of pieces, superiority of metal, harmony of parts, accuracy of workmanship, fine graduation without systematic error, adequate micrometer-microscopic power, micrometer screws devoid of mechanical defects, trustworthy levels, and commensurate optical power.

Unfortunately, we frequently find observers who lack the peculiar faculty of judging of the relationship suggested, or, if able to point out any given defect, they may not have the mechanical ability to state explicitly the character of the defect. Then again, the instrument maker is very rarely an observer, and even when the skilled observer proposes a modification suggestive of an improvement, it is with the utmost difficulty that the change can be effected. The maker will not or cannot see wherein his work is not equal to all the requirements of the instruments, and every observer must have experienced the objections raised to every modification or new design proposed by himself. Even when the maker is anxious to carry out the proposed improvements it requires the highest mechanical skill to effect the final corrections, which are necessarily microscopic in their amount.

## Base Measuring Apparatus.

This is the groundwork of all the higher geodetic measurements. Upon it, as the unit of length, depends the results which give us the size and form of the earth, the distance and size of the planets. It is as far removed beyond the ordinary surveying chain as the astronomical clock exceeds the ordinary watch. Nevertheless, this instrument must combine portability, simplicity, comparative rapidity in manipulation, and accuracy of measurement in an eminent degree. Of the various forms of base apparatus in Europe, I know of none that so satisfactorily fulfills the requirements of a field instrument of precision as the compensating base apparatus of the coast survey, whilst the subsidiary base apparatus has no counterpart for the special duty for which it was designed.

All wooden, glass and metallic base measuring apparatus have the lengths of the bars changed by changes of temperature. These changes of temperature are measured by the thermometer, an extraneous instrument that in fact only records its own changes. The change of a metallic bar may or may not be denoted by the change of temperature indicated by the thermometer. The bar may receive or part with heat at a different rate than the thermometer, or its changes may precede or follow the changes indicated by the thermometer. If the thermometer does not accurately denote the changes of the measuring bar in time and relative quantity, no proper corrections can be applied to the results given by the bar. If, therefore, the base-work of the whole geodetic system is erroneous, the development of error follows the expansion of the system of triangulation.

But it is possible by the use of two metals having different values for specific heat and different heat-conducting powers, to so combine them as to obtain two points in the system, that shall be at an invariable distance apart, whatever be the temperature of the system or whatever changes of temperature are taking place in the system. You have such a compound system in the gridiron and in the mercurial pendulum of the astronomical clocks, and in the compensated balance of the chronometer.

I do not propose at this time to enter into any detailed description of such apparatus; that is fully given elsewhere; but it is in order to state that when a compound bar of brass and iron is used as the base measuring unit, two methods are at once suggested as available for having two points of the system at an invariable distance apart.

1. The brass and iron bars having the same cross section, may be coated with such varnishes as experiment indicates should give heat-conducting power to either bar in inverse proportion to their power of conductivity.

2. The brass and iron bars should have their surface and cross section properly proportioned to their specific heat and conductivity.

In the English or Colby apparatus the former principle was applied; in the American apparatus the latter has been adopted, and the cross sections of the two bars have so determined that whilst the two have equal absorbing surface, their masses, corrected for their different rates of conductivity, are inversely as their specific heats. If there had ever been any doubt of the superiority of the method chosen

by the Coast Survey, it is fully dissipated by experience.

In the measurement of the base lines of the great trigonometrical survey of India, since 1830, a base apparatus, precisely similar to the Colby compensating base apparatus of the Ordnance Survey has been employed. Elaborate descriptions thereof have been published, and one or two features only need be mentioned in establishing a comparison of its working capacity with that of the Coast Survey. Of course the comparison holds good for the original (1827) Colby apparatus of the Ordnance Survey. In the Indian apparatus there are six compound bars, each 10 feet in length, with fine microscopes connecting the bars, and one at each end of the six, so that when all these are in line, the length of each measure is about 63 feet. Each of the compound or compensated bars, the one brass and the other iron, has the same cross section, 0.55 by 1.50 inches, and they are placed on their broad sides, 1.30 inches apart. That each component, brass and iron, might acquire the same temperature in the same time, experiments were made which seemed to show that it was possible to give them appropriate coatings, which would reverse their normal capacities for heat. This is the fatally weak point of the system of compensation, and in the excessively hot climate of India has given rise to much trouble, and the radical mistake has been only partially overcome by the patience, skill and ability of the observers.

The adjustment of bars and microscopes is tedious; and as the measurements are invariably made with the bars horizontal and never hypothenusal, care is taken to select ground either level or gently undulating. When there is considerable slope the measurement is made with sets of two or three bars instead of with the six.

Col. Waugh reports\* that "Col. Everest in his work on the Indian arc, has stated that no dependence can be placed on the permanent length of the compensation bars. One cause of this lies in the difference of temperature between the two metals in the compound bars at any given moment, independent altogether of the absolute temperature." \* \* \* "From sunrise their length first increases a little and then diminishes for a time, although the temperature [as recorded by the thermometer] is rapidly increasing; after which they again expand, the heat still increasing." \* \* \* "The only remedy available to us for this inconsistency in the length of the compensation bars, is to compare them with the standard under circumstances exactly identical with those prevailing during the measurement."

It was also discovered by Capt. Herschell† that part of the fluctuations in the lengths of the compensation bars was contingent upon the positions of the bars relatively to the sun, and to prevailing winds during the comparisons; and consequently part of the fluctuations are functions of the azimuth of the base lines (supposing the sun to be unclouded) and the direction of the winds!

In the comparisons instituted with the standard bar it was found that the relation of the two bars of the compound bar with the standard bar and with the wall of the house by the side of which the comparisons were made, also affected the compensation. This led to the method of daily comparison with the standard in the field. Even then it is very questionable whether good comparisons can be obtained. Certainly every conceivable source of error was present, from the fundamental mistake of adopting an erroneous principle; and supposing the errors measurable and controllable, the labor of computation becomes excessively tedious.

All the base lines measured with this instrument have, with three exceptions, been divided into three or four sections, the relative lengths of which have been compared by triangulation along one or both flanks for the purpose of verification. One of these exceptions is the Cape Comorin base of 1869, which was measured, "not so much with the view of very great accuracy, as ascertaining the errors to which base lines measured with this apparatus are liable. This was to be effected by comparing the results of four independent measurements of the base, and by determining the magnitudes of the errors which may possibly occur in each of the several processes of the operation."‡

A systematic series of comparisons with the standard bar was made during the measurements; and in order to determine the actual temperature of each bar, two wells were sunk to a depth of seven-eighths of an inch into each of the components of one of the six compound bars, at a distance of two inches outside the points of support, in order to receive the bulbs of the thermometers which were required to indicate the temperatures. The standard bar had also similar wells, and all were filled with oil to facilitate the conduction of the temperatures of the bars to the thermometers. Here was thus introduced a third probable source of error.

All the measurements were made under tents composed of a four folds of cloth of various colors to prevent the passage of heat, and every practical device exhausted to obtain trustworthy results.

Since the use of the Colby compensating base apparatus in 1830, there have been measured for the great Indian schemes of triangulation, ten bases, of which nine averaged 7.17 miles and the Cape Comorin base (1869), which meas-

\* Great trigonometrical survey of India, Vol. I, standard of measure and the base lines. Dehra Doon, 1870.

† Op. Cit.

ured 1.68 miles.\* The average actual working time of each of ten measures of the first nine bases was 35½ days, excluding the time occupied in making comparisons with the standard bar. The four measurements of the Comorin base occupied 33 working days. This short base was measured as before stated for a special purpose; for the practice in the great trigonometrical survey has been to bases of about seven miles. The time occupied in measuring these bases has been more than double that required in the use of the Coast Survey apparatus, whilst the method of supporting the bars permits the measurement to be made on slopes as great as five degrees.

Lest you may suppose for an instant that I have expressed a too rigorous judgment in this question of base apparatus, I not only refer you to the published reports of the great Indian survey, but to the following remarks of Col. Waugh thereon:

"There were no means of ascertaining the actual temperature of the components of the compensation bar at either of the nine base lines which were first measured by it," before these discoveries. "Thus a sensation of dissatisfaction with the performance of the apparatus has been experienced to a greater or less degree by all the officers of this survey who have been brought into contact with it, and there has always been a feeling of disappointment that the accuracy of the operations was not in keeping with the powers of micrometric measurement."‡ And I may add with the skill and patience of the observers.

In comparison therewith our repeated measurement of bases in the United States indicate with almost mathematical certainty that the length of each base is given within its one millionth part. In other words, if the Coast Survey measured a base of 1,000,000 yards or 568 miles in length (i. e., from San Francisco to Portland), we might rest assured that the error thereof would not amount to one yard.

\* Op. Cit.

**RELATION OF RAILROADS TO NEW INVENTIONS**—A recent decision by a Judge of the Supreme Court of Illinois contains the following sentence: "While it is the duty of railroad companies to furnish good, well-constructed machinery, adapted to its due uses, and made of good materials, and of the kind found to be most safe when applied to use, they are not required to seek out and apply every new invention, although they must adopt such as are found by experience to combine the greatest safety with practical use."

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and the subscribers against the acts and mistakes of others.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whole skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

Among the advantages gained by this holder are the following:

- It can be opened and closed quickly.
- The points are less obstructed while the articles to be filed are being placed.
- The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.
- The elastic hinge and band accommodate and hold firm either a large or small number of papers.
- With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding.
- It has no rigid hooks, hinges or loose parts to break or get lost.
- It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.
- Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure.
- Single samples will be mailed from this office for 50 cents, postpaid. Wholesale and retail agents wanted.

## ARTIFICIAL LIMBS.

**MENZO SPRING,**  
MANUFACTURER OF

## DEWEY &amp; CO.

## American &amp; Foreign Patent Agents

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

**PATENTS** obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

## Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

## Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

## Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

## Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## DEWEY &amp; CO.

G MAHE, Director,

Continued from Page 325.

ing works are now being erected over the Black Jack mine, and in two weeks they will be completed and in running order. At but a short depth from the surface the ledge is 10 feet wide and abounds in pay rock of good quality throughout, much of it yielding as high as \$100 to the ton and upwards. The development is considered the most remarkable of any that has yet come to light in this camp, and it is the opinion of some of our most experienced miners that, as the work progresses, the owners of the mine will have one of the most promising ore bodies ever discovered in Idaho. All the indications are unusually favorable. Florida mountain is certainly looming up, and, with the favorable conditions and prospects of the War Eagle mines, Wagon town and South mountain, it is safe to predict that the new year will usher in upon us a season of prosperity, such as we have not witnessed here for a long time.

At the Empire, work has not been in progress below for the past few days. The machinery is being overhauled and put in good shape preparatory to the winter campaign.

Work is progressing as usual in the Belle Peck, and a profitable winter's campaign is anticipated.

There is a limited number of men at work in the Wagon town mine, and the prospects generally are quite encouraging.

At the Golden Chariot the business is running along finely.

## Montana.

**SALLIE BELL LODE.**—Helena Independent, Nov. 8: Yesterday Mr. John Leeson entered into a contract to run a tunnel to tap the Sallie Bell lode. The distance to be run is 100 feet. When completed it will open the lode to a perpendicular depth of about 100 feet. The contractor is an energetic, practical miner, and will push along the work as rapidly as possible. We are pleased to see the owners of mines resume operations in the Ten Mile district. It shows that they have faith in them and at the same time it will be a good thing for the country as undeveloped mines are useless. The successful running of the Helena smelter has had the effect of stimulating mining enterprise in the Ten Mile district, as the ores there are mostly of a base character.

**LEXINGTON MILL.**—Butte Miner, Nov. 6: The engine for the Lexington mill arrived last Thursday and is now being placed in position. It is of 60-horse power and was formerly in use in the Hendrie mill at Unionville.

The western level on the Stevens lode has reached a distance of 80 feet from the working shaft, and throughout its whole length free milling ore of the high grade that we have already mentioned has been found. At a low estimate, the ore between this level, 42 feet deep and the surface is worth \$10,000.

**PHILLIPSBURG ITEMS.**—About this season of the year we have a slight increase in our population by the arrival of the placer miners from Willow and Rock creeks, and some from pioneer. The boys come here to "winter over," and generally obtain work. Both our mills keep pounding away steadily, and are producing very large amounts of bullion. The quartz that is now being hauled to the mills looks remarkably well. The arastras at Silver lake have been frozen up within the last day or two. The ore worked this season has been very rich, and the owners, Meers, Sloss & Hammond, have done well. There is a report that the Belmont company is to some extent going to resume operations here this winter.

## The Mining and Scientific Press.

We do not know whether our readers need to be reminded occasionally that they get "value received" in the PRESS or not; but as the year is drawing to a close, it is perhaps as well that our subscribers should recollect that it will pay them to continue their subscriptions. New subscribers are, of course, always welcome, and our present readers can assist us greatly by calling the attention of others to the merits of the paper. A glance at the contents of this week's PRESS will convince any one that as a home journal, devoted to industrial pursuits, it is in no way behind other technical journals.

Mining men will find considerable of interest to them in the article on the mining laws, giving, as it does, answers to several important questions. There is also described a new dry placer amalgamator, a new device for saving gold, called blanket riffles, and a new ore feeder just patented. Then there is the continuation of Mr. Bowie's valuable article on hydraulic mining, with appropriate illustrations, giving this time important data concerning the capacity and cost of storage reservoirs and dams. There is also a timely article on "Mistakes in Mining," and some remarks about the failure of the river mining machines which were so much talked of not long since. We give also brief descriptions of the patents granted to Pacific coast inventors for the week. The correspondence page has an article on "Calaveras County Mines," "Wilhelm's Dry Placer Amalgamator," and "Trees and Rainfall." This last is the first of a series of valuable articles on this subject by Mr. Samuel Purnell, a valued contributor. Although general in its nature facts have been collected especially relating to this coast, and the article is a valuable one and worthy of careful perusal.

We give also an excellent article read before the California Academy of Sciences by the President, Prof. Geo. Davidson, of the U. S. Coast Survey, on "Instruments of Precision," which is especially valuable to engineers. To this profession also is devoted another page. The usual departments of "Mechanical Progress," "Scientific Progress," "Useful Information," "Good Health," etc., are given, all of which are of valuable interest. Some seven engravings are given with the articles in this issue. The mining summary is replete with current mining news from all quarters, carefully condensed and in a shape for easy reference. The original matter is by no means confined to the ordinary "editorial" pages, but is printed as well in other parts of the paper. The stock tables, giving all the details of operations for the week, will be found in the usual place.

Altogether we feel that we are doing our duty to our readers in making the paper as interesting as possible, and only desire that our labor to this end shall be appreciated. As we stated before any one who glances at the contents of the PRESS will see that it is just the paper for the miner, manufacturer, engineer and mechanic and the industrial classes generally.

## The Colorado Dry Placer Amalgamator.

**EDITORS PRESS:**—The two or three brief notices of the "Dry Placer Amalgamator" which have appeared in the columns of your valuable journal have sent us more letters of inquiry than have come through any other source, and we have been most liberally noticed by the press generally from New York to the Pacific coast. Please accept our thanks.

The control for California and Arizona has just passed out of our hands. Mr. Chas. H. Howland, of 331 Kearney street, San Francisco, will cheerfully answer all questions relating to the machine in said State and Territory, as also for the colonies of New Zealand and Australia. Mr. H. will also exhibit a sample of gold saved by our machine. Also a few testimonials, both of which, I venture to predict, will very greatly surprise you. He will, no doubt, soon have a machine in operation not far from your city. Respectfully yours,

E. S. BENNETT,  
for DUHEM & BENNETT.

Denver, Colorado.

This letter is only another proof of the usefulness of the PRESS, not only to those who have mining appliances to introduce, but also to those who need such appliances. It shows also that the mining community are interested in any new improvements, and look to the PRESS to point them out. This we always endeavor to do. The notices in this journal brought these gentlemen more letters of inquiry than those in all the other papers combined; and they say they were liberally noticed from New York to the Pacific. Advertisers will do well to bear this point in mind, as it indicates the proper medium to reach most satisfactorily and reliably the mining community—a class of people scattered over a large area of territory. The PRESS, however, circulates in every camp on the coast, large and small, and is read by miners, millmen, superintendents and mine-owners generally.

## Blanket Riffles.

Mr. J. C. McCurdy, whose dry placer machine we described last week, has shown us another mining appliance which he has invented, for saving gold in a quartz mill. A blanket is taken and cut into strips, and these strips sewed together so as to fit into the sluice under the settler. The edges of the strips of blankets then form a series of riffles for catching quicksilver, gold and sulphurets. The blanket riffles are about six inches apart.

Under the blanket are several half oval bars of iron flat side down, which extends longitudinally through the sluices, and are fastened together. A bell-crank motion moves these bars laterally back and forth under the blanket riffles and they serve to keep the material gently stirred up so that the tailings will flow off readily. By this lateral motion of the bars under the blanket, the pulp is prevented from packing. The edges of the blanket riffles are of the very best form for catching gold and quicksilver, and the blankets can be taken out and washed or eventually burned in the usual way.

The device is intended to be placed below all the mill machinery to catch gold, quicksilver and sulphurets. The expense of the appliance is trifling in itself and the blanket riffle can be replaced as often as desirable. The half-oval bars, or mullers, can also be used to advantage in under currents in hydraulic mines, to keep the sand from packing and assist it in flowing off.

## General News Items.

A BILL has been introduced in Congress to establish a department of commerce.

GEN. PEARSON has been acquitted of the charge of murder in connection with the riots of July last at Pittsburg.

DAVIS has introduced a bill in the House for the erection of a post-office building at San Francisco.

KEARNEY and the other men who were arrested recently for riot, have been released from custody.

THE Collateral Savings and Loan Bank, burst up last week, John Tyler, Jr., the manager is in jail.

THE Mercantile Library Association of this city is now entirely out of debt, the first time since 1866. The building and library of the association are worth, probably \$300,000.

**HYDRAULIC MINING.**—The article on this subject from the pen of the well-known engineer, Aug. J. Bowie, Jr., which is now being published in the PRESS, is an especially valuable one, and our hydraulic mining friends will find it alone worth more than a year's subscription to the PRESS. The facts and figures given by Mr. Bowie are of great value as showing the results of practical work. A reliable article of this kind is more profitable for miners to read and study than any other class of literature. We advise those who do not usually file away the PRESS to commence keeping their numbers now and they will have this standard article as a whole. It has been carefully revised and corrected by Mr. Bowie and comprises the whole literature of hydraulic mining in California.

## PATENTS AND INVENTIONS.

### List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING NOVEMBER 6TH, 1874.  
TREADLE.—Hans Shogren, Portland, Ogn.  
MEN'S DRAWERS.—Henry Borkhim, S. F.  
HINGES.—Benj. Fabnestock and Henry F. Peckham, Watsonville, Cal.  
MACHINE FOR FORMING INSERTIBLE SAW TEETH.—William Hawkins, S. F.  
VEHICLE SEAT.—Fred'k Oppenheim, S. F.  
VEHICLE SPRINGS.—Fred'k Oppenheim, S. F.  
CATCH FOR SLUICE COUPLING.—Ambrose A. Osborne, S. F.  
CAR TICKET NIPPERS.—Jas. Thomas, S. F.  
PROCESS OF SEPARATING METALS.—Courad Wiegand, Virginia City, Nev.  
OVERALLS.—Leon Atkinson, S. F.  
CAN OPENER.—James P. O. Lownds, Portland, Ogn.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTES.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO. in the shortest time possible by telegraph or otherwise at the lowest rate. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

### Highest Award to the Averill Mixed Paint.

At a meeting of the Board of Managers of the Mechanics' Institute held in this city, Tuesday evening of this week, the committee on Mixed Paints submitted a long and interesting report, which we deem of such importance to our readers that we hasten to make prominent some of the leading points. The award of the Institute medal, highest in the gift of the society, was made to the California Paint Company over all competitors; and the report, as we shall show, is unequivocal in favor of the Averill Mixed Paint manufactured by the company named.

The committee appointed by the Institute for the examination of mixed paints were, Profs. Hilgard and Rising of the California State University, W. B. Ewer, Mr. Frost of Frost & Richards, Mr. Hopps of Hopps & Sons, two leading firms of practical painters.

The claim for the Averill paint was, that it is the best mixed paint and the award certified the truth of this claim.

The tests were in every way fair and impartial and the committee were furnished with the material distinguished by numbers and not by its name. Samples were taken by the Secretary from the exhibits at the pavilion and put in unlabeled cans and with this unnamed material the committee dealt until they reached their conclusion concerning composition, etc.

The first test was the application of the paint to a board surface in the pavilion by a painter who did not know the name of the paint he was using. All the mixed paints entered were tested in this practical way to determine their spreading qualities and covering power. On this first test it appears from the report that the Averill mixed paint was declared the best.

Then samples of each paint were delivered to Profs. Hilgard and Rising for analysis at the State University. These analyses showed that the Averill mixed paint was composed of the materials as claimed, namely: white lead, zinc and pure linseed oil, and unadulterated. The chemists also report in the Averill paint the presence of silicate of soda, or "water-glass," and speak highly of the use of it as a means of holding the lead and oil in permanent chemical solution, so that no separation and consequent degeneration of the paint can occur. They draw a contrast between this and ordinary paint. In ordinary paint the oil separates from the lead and this leaves the lead dry, so that it rubs off like the lime in whitewash. This is wholly obviated in the Averill system of manufacturing mixed paint.

The report of the committee details the pains taken to visit houses painted with the competing paints, and they conclude that the Averill mixed paint weathers best, neither "peeling" nor "chalking," and in enduring, retaining gloss, exhibits those qualities which all users of paints desire. Examination was made of houses painted from one to seven years with the Averill mixed paint, and the result was the declaration of its superiority over all other paints.

There has probably never been in this country so thorough a test of paints as was made by the Committee of the Mechanics' Institute. Beginning, as they did, with the working qualities of the fresh paint, they pursued it through accurate analysis of materials and finally applied the practical test of observation where the paint had stood for years the storm and sunshine on exposed surfaces. The award from such an examination and from a committee of men whose names are sure to the community of their honesty, is the highest possible testimonial of the quality of the goods which are offered to the public for their patronage. It would be well for purchasers if all supplies offered them by manufacturers could boast of such evidence of purity, value and endurance.

SUPERINTENDENT BOLANDER has resigned from his position at the head of the school department. Deputy Stowe succeeds him.

## Musical Instruments.

The firm of Kohler & Chase, of 633 and 635 Clay street in this city, is an old established and trustworthy house, dealing in pianos, organs and all other kinds of musical instruments. They are extensive importers of instruments and instruction books, and have long held an enviable position in this branch of trade. We take pleasure in recommending them to all our readers who wish to introduce the refining influences of music to their homes. The firm make a specialty of the Decker Brothers' piano, the Mason & Hamlin cabinet organ, the Emerson piano and the J. & C. Fischer upright piano. All of these instruments have gained a wide fame for excellence and won high praise from those who know best what constitutes excellence in a musical instrument.

We would speak especially at this time of the Decker Brothers' piano. We cannot do better than present a testimonial of its quality, freely given by a group of musicians whose praise will commend itself to all music lovers. During the Centennial there was held in Philadelphia a grand musical congress, at which the Decker Brothers' instruments were used, and the result was the following straightforward endorsement:

PHILADELPHIA, June 27th, 1876.  
The Decker Brothers' Grand pianos, used by the Musical Congress at their grand operatic concert and musical festival, recently given at the American Academy of Music, were remarkable for their superior quality of tone and extraordinary power. Finer instruments we never heard. Clara Louise Kellogg, Annie Louise Cary, Zaida Seguin, Julia B. Rive, Emeralda Cervantes, Joseph White, Max Maretzek, P. Brignoli, S. B. Mills, P. Ferranti, Franz Remmert, E. Behrens.

A matter which we would make most prominent in this connection is, that the Decker Brothers' name is the subject of attempts at counterfeiting. This is the penalty which the manufacturers of a first-class instrument have to pay for the gaining of a good name, and all our readers should be on their guard against imposition. Unprincipled parties have manufactured and sold cheap pianos under the names of "Decker," "Decker & Co.," "Decker & Brothers," "Decker Brothers," etc., doing business on the reputation and popularity of the celebrated Decker Brothers' pianos. \*All genuine Decker Brothers' pianos have their name in front on the pianos above the keys, viz.: Decker Brothers, New York. In all genuine Decker Brothers' square pianos the following words appear, cast upon the iron plate on the inner left-hand side of the instruments: Decker Brothers' patent, June 2d, 1863.

The simplest way to guard against imposition of the kind named is to deal with those who are well known to be trustworthy. Kohler & Chase are parties of this character.

Address, FRED. H. SMITH,  
 Civil and Mining Engineer,  
 54 Lexington St., Baltimore, Md.

## TEN PER CENT.

## First Mortgage Bonds

AT PAR.

The Sierra Flume and Lumber Company have mortgaged their large property—principally lands—to secure the payment of 1,200 Bonds of \$500 each, running for one, two or three years and bearing ten per cent. interest, payable semi-annually.

Two hundred Bonds of either series are now offered for sale at par, to close this season's business. The remainder will be held for another year.

The property cost over \$1,400,000, and has produced the last six months \$800,000 worth of lumber; at a cost of \$400,000, most of which is stacked and drying, to be in readiness for sale, and for which there is a good market, both at home and abroad.

Mr. Alvinza Hayward, being the chief owner, will give a written guarantee that the Bonds and interest will be paid at maturity.

Merchants' Exchange Bank Stock will be taken in exchange, at \$75 per share.

For Bonds and further particulars apply to R. G. SNEATH, President Sierra Flume and Lumber Co., 423 California Street, San Francisco.

## QUARTZ MILL AND MINE FOR SALE.

The Quartz Mine situated on Humbug Creek, Siskiyou County, Cal., known as the New Eliza Mine, together with a

## Fifteen-Stamp Mill Complete,

A twenty-five horse-power steam engine, and all the appurtenances thereunto belonging, will be sold at a bargain if applied for soon. For further particulars apply to

C. JUNKER,

Bella Union Saloon, Yreka, Cal.

## TAXES.

1877-1878.

Notice is hereby given, that a certified copy of the Assessment Book of the Taxable Property of the City and County of San Francisco, Real Estate and Personal Property (Subsequent Assessment Book included), for the Fiscal Year 1877-78, has this day been received; that the State, City and County TAXES for said fiscal year are now due and payable at the office of the undersigned, Room No. 1, City Hall, and the Laws in regard to their collection will be strictly enforced.

Taxes will become delinquent on the FIRST MONDAY in January, 1878, and unless paid prior thereto, Five per cent. will be added to the amount thereof.

WM. FORD,

Tax Collector of the City and County of San Francisco.

SAN FRANCISCO, October 22, 1877.

## Montgomery Avenue Tax.

Notice is hereby given that a certified copy of the Assessment Book of Real Estate, which is subject to Assessment to defray expenses incurred by the opening of Montgomery Avenue, has this day been placed in my hands to collect Taxes thereon.

Said taxes are for the Fiscal Year 1877-78, and are now due and payable at the office of the undersigned, Room No. 1, City Hall. All Taxes remaining unpaid on the FIRST MONDAY of January, 1878, will have Five per cent. added thereto.

WM. FORD,

Tax Collector of the City and County of San Francisco.

SAN FRANCISCO, October 22, 1877.

## ASSESSMENT OF LANDS

## Benefited by Widening Dupont St.

Notice is hereby given, that a certified copy of the Assessment Book of the Real Estate which is subject for the payment of Principal and Interest upon "Dupont-Street Bonds," as directed by an Act of the Legislature of California to authorize the Widening of Dupont Street in the City of San Francisco, "Approved March 23, A. D. 1876," has this day been placed in my hands for collection. The Laws in regard to the collection of the same will be strictly enforced.

WM. FORD,

Tax Collector of the City and County of San Francisco.

SAN FRANCISCO, October 22, 1877.

Position Wanted.—A Mining Engineer, with best California references, well experienced in tunneling and shaft sinking, good mill-man, competent assayer and surveyor, desires a position with some mining company, to assist a mining or hydraulic engineer, assayer, etc. Address, M. E., this office.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

## California and Oregon Land Company.

Location of principal place of business, San Francisco, California. Location of works, Jackson County, Oregon. Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of October, 1877, an assessment, No. 1, of thirty-five cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 418 California Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the twenty-eighth day of November, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before will be sold on Monday, the twenty-fourth day of December, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

J. W. CLARK, Secretary.

Office, 418 California Street, San Francisco, California.

## Excelsior Silver Mining Company.—Prin-

cipal place of business, San Francisco, Cal. Location of works, Polioz Dab, Lincoln County, Nevada. Notice is hereby given that at a meeting of the Board of

Directors, held on the second day of November, 1877, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold and silver coin, to the Secretary, at the office of the company, 312 Post Street.

Any stock upon which this assessment shall remain unpaid on the third day of December, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the seventeenth day of December, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. A. KOLLMAYER, Sec'y.

Office, 312 Post Street, San Francisco, Cal.

## Mariposa Land &amp; Mining Company of

California.—Location of principal place of business, San Francisco, California. Location of works, Mariposa County, Cal.

Notice.—There is delinquent upon the following described stock, on account of assessment (No. 12) levied on the 12th day of September, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

## Buy the Best.

Before purchasing an American  
Watch, examine the different styles  
manufactured by the **HAMPDEN  
WATCH COMPANY**, at Springfield,  
Mass. They are the latest and  
best improved manufacture. You  
can depend upon them for fine finish,  
durability and perfect time. They  
are sold at favorable prices—in  
fact, no higher than many of the  
inferior styles. Examine into the  
merits of this Watch before you  
buy any other. Our word for it,  
you will not regret it.

**DEWEY & JORDAN, Agents,**  
433 Montgomery St., S. F.

**To Ship and Engine Builders, Steam  
ship Companies, Etc.**

A Mechanical Engineer, having an extensive experience  
in Marine Engineering (especially compound) and Iron  
Ship Building, also in Steam Engines and Machinery in  
general, is open for engagement. First-class references.

Address and references can be obtained at office of Sci-  
entific Press.

## Machinery.

**SNYDER'S  
LITTLE GIANT STEAM ENGINE.**

For Farmers, Machinists, Printers and all requiring  
light power. Sizes from one to six horse-power. Prices  
for engine and boiler complete, from \$150 to \$450. We  
make the strongest boiler and the best engine in the  
country. Call at our factory or send for free illustrated  
and descriptive catalogue.

**SNYDER BROS., 94 Fulton Street, N. Y.**

**The Ingersoll Rock Drill**

**J. B. REYNOLDS,**

(Room 10,) 320 Sansome Street.

**THE O'HARRA  
CHLORIDIZING FURNACE**

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

**Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:**

One man.....	\$ 4 00
One man.....	3 00
Wood—2½ Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2½ cts.....	40 00

Cost of 20 tons.....	\$52 25
Cost of one ton.....	2 61½

In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Exchequer mill, Alpine Co., Cal. For further infor-  
mation, apply to

## TULLOCH'S AUTOMATIC ORE FEEDER,

Awarded the Centennial Medal.

Refer to the Following Named Mills:

### SILVER MILLS.

Con. Virginia; California; Trench; Douglas; Northern Belle; Leopard; Humboldt; Eagle; Columbus; Central America; Guyamas; Martin White; Tasso; Rye Patch; Everett; Heberlein & Co.; Manhattan; Duncan, L. S.; Phenix Copper, L. S.; Barranco; Emigrant; Sunrise; Maunee.

### GOLD MILLS.

Gold Mountain, Amador; Gold Mountain, San Bernardino; Buchanan; Green Mountain; Santa Rita; Riverside; Shawmut; Knox & Boyd; Spring Gulch; Magruder; Douglas; Hite; Phenix, Amador; Banker's; Church Union; Mount Tomales; Crescent; Tiffany & Hepburn; Gold Strike; Thomas Evans; Republic; Omaha; Sumner Mill.

FRED'K OGDEN, Sole Owner Tulloch Patent,

ROOM 72, NEVADA BLOCK.

Extract from a letter from C. G. Rodgers, Superintendent Green Mountain Mining Co., Plumas County, September 10th, 1877: After using both the Tulloch and Hendy Ore Feeders, side by side, for eight months, I can candidly say, that in my opinion, the Tulloch is much the best machine; it will feed any ore that can be fed by machinery; there is nothing about it to wear out, and should anything break, any blacksmith can repair it. Whereas, the Hendy machine is wearing from the moment it is started, and when any thing is worn out, or broken, you must have a machine shop or foundry to make the repairs. The Hendy Feeders are not in use at the Gold Strike Mill; they were thrown out after a fair trial of some two weeks.

### Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

Office, No. 320 Sansome street, Room 10.

25 Favourite Cards, no two alike, with name, 10c. postpaid. GEO. I. BEED & CO., Nassau, N. Y.

### San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER.

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

30 FINE CARDS, no two alike, with name 10c postpaid. Outfit 10c. CLINTON BROS., Clintonville, Conn.

## \$1,000 Challenge Ore Feeder.

### HENDY'S \$1,000 CHALLENGE ORE FEEDER.

I call my Automatic Ore Feeder the \$1,000 Challenge, because I challenge the owners or backers of any other feeder to a competitive test for that amount. As Mr. C. G. Rodgers, Superintendent of the Green Mountain mine, near Greenville, Plumas county, appears prominently as a detractor of the merits of my feeder, and seems confident that another one is better, perhaps he will accept this long-standing challenge which the owners of other patents will not, and give me an opportunity to prove publicly the superiority of my machine. As to Mr. Rodgers' assertion about my feeder wearing out, it is no less fallible in that respect than other machinery; but I have over 250 now in use, some of them for over two years, and have never had to expend 25 cents for repairs. The fact that my feeder received the premium at the late Mechanics' fair, and that I am shipping several feeders weekly to different parts of the country, is sufficient proof of the appreciation in which it is held.

As to my feeders having been thrown out of the Gold Strike mill, they were not displaced for inefficiency, as the following letter will show, and it answers also as a complete refutation of Mr. Rodgers' statement:

OFFICE SUPERINTENDENT OF THE GOLD STRIKE G. M. CO.,

GREENVILLE, PLUMAS CO., OCT. 16TH, 1877.

JOSHUA HENDY, Esq.—Dear Sir:—Your favor of the 15th instant at hand. In reply to your inquiry as to the working of your ore feeders at our mill, we can say that there is no fault in the machines, and we consider them the best now in use. At present they are not in use with us, owing to the construction of the mill, which we are about to rebuild and make proper arrangements for putting in your feeders.

J. K. OWEN,

Superintendent Gold Strike Mine.

One of the principal owners of the Gold Strike and Green Mountain mills is also largely interested in the Plumas National mine, where I have just shipped several feeders, showing the confidence placed in the machine by these gentlemen who have used it.

Now, if Mr. Rodgers is sincere in his belief as to the merits of a rival machine over mine, here is a chance for him to make a thousand dollars easily, if he can get the owners of the machine to lend him one for the trial, which is the only doubtful thing in connection with the matter. Mr. Rodgers' eight months' experience with both machines ought to give him confidence enough in his own convictions to accept the challenge offered to him, or any one else.

JOSHUA HENDY.

Corner Fremont and Market Streets, San Francisco.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other the market, and will sell them as cheap as any other of its class.

Mothers who Dose their Darlings with drastic  
purgatives incur a fearful responsibility. The gentle moder-  
ate (yet effective) laxative, alterative, and anti-bilious opera-  
tion of TARRANT'S SELTZER WATER peculiarly adapts  
it to the disorders of children.

Attention, Mining Companies.

### RICKARD'S PATENT

Oxidizing and Chloridizing

### FURNACE,

FOR ROASTING

### COPPER, SILVER & OTHER ORES

Prior to Leaching or Amalgamation

The most striking advantages which it offers above all  
other recent inventions of this nature may be briefly sum-  
med up as follows:

First.—Its cheapness, the cost of its erection (ex-royalty  
and freight) not exceeding \$1,500, for a capacity to roast  
and chloridize twenty tons per day, viz brick work,  
\$1,000, and iron work, including blower, \$500.

Second.—Short time required for erection, viz: 14 days,  
after providing all materials, with a sufficiency of la-  
bor.

Third.—No expensive, heavy or complicated machinery  
being necessary, involving heavy freight to the district  
where it may be required. Brick and clay generally ob-  
tainable on the spot, being the chief materials required  
in its construction.

Fourth.—No skilled labor or technical experience is  
necessary to work it. Two ordinary laborers being suf-  
ficient to attend to it when in full operation.

Fifth.—It does not easily get out of order, and is  
readily repaired by an ordinary mason or blacksmith  
when it does.

Sixth.—The royalty, or license to use it, is exceedingly  
moderate, removing thereby all temptation to evade or  
infringe the patent.

Seventh.—Calculating labor at \$3 per day, and wood at  
\$6 per cord, the cost of roasting is but little over \$1.50  
per ton (ex-salt when chloridized), at these high Califor-  
nia rates for labor and fuel.

One of them is now in the course of erection by the  
Aztec Gold and Silver Mining Company, at their mill in  
the Aztec District, Santa Rita mountains, Southern  
Arizona. At their office, 302 Montgomery Street, rooms  
14 and 15, a model may be seen, and working drawings,  
with all further information necessary to enable any ordi-  
nary mason to construct the furnace, may be obtained  
from

COL. J. D. GRAHAM.

SAN FRANCISCO, SATURDAY, DECEMBER 1, 1877.

VOLUME XXXV.  
Number 22.

## The Prospector.

[Written for the Press by VOL. U. BILLY.]

Volumes have been written in times past setting forth the claims to public esteem of the numerous heroes of every age and clime. The orators, poets, philanthropists, statesmen, warriors and others who have figured more or less conspicuously in the life drama of nations or localities, and whose deeds or words have been considered of sufficient importance to occupy a place on the pages of history. But there is a class of men whose claims to public attention have hitherto been almost entirely overlooked, and who, although their entrances or exits upon the active scenes of life have never been characterized by that meteoric splendor that is so often seen in the transit across the social firmament of some favored son or daughter of fortune, who, through some great achievement of sword or pen, has excited the admiration of the world, and whose praises have been sung by ten thousand tongues in words of burning eloquence, have by their self-sacrificing perseverance, contributed in no small degree to the wealth of the world and very largely to that of the Pacific coast.

The class of which I speak is the mining prospector, that vanguard of civilization on this coast, who has, for the last 28 years, with steadfast purpose and unfaltering steps, through summer's heat and winter's storms traversed every desert, ascended every mountain and prospected in every stream from Cariboo to Mexico, and from the eastern base of the Rocky mountains to the Pacific ocean; often contesting the ground foot by foot with its savage occupants, sometimes vanquishing and sometimes vanquished. But few, if any, who have never experienced it, can fully realize the hardships and privations that many of them have undergone and are still experiencing in their struggle to gratify their almost insane desire to "strike it rich." The true prospector must have a "well-spring of hope in his soul" for none but those of the most hopeful disposition can long continue in the business under the discouraging disappointments that most of them experience sooner or later. Many of them after long years of unrequited toil in their search for the hidden treasures in nature's storehouse have succumbed to the fatal bullet of the wily savage, the malarious poison of some miasmatic region, or overcome by hunger and fatigue have sunk down to die, "Unwept, unhonored and unsung," on some dreary desert, far from friends and kindred, their golden life-dreams still unrealized. Many of them "have seen better days," having perchance left positions of honor and profit, and inspired with the hope of suddenly acquiring wealth in a manner so strongly tinged with romance have gone forth determined regardless of the many sufferings and dangers to which they were exposed to deserve if they could not win the smiles of fortune's fickle dame.

Some look with scorn and derision upon the prospector and consider him visionary and impractical, profligate and reckless; that there are some such among them none will deny, but many of them are sober, industrious and practical men who have weighed well the chances before embarking in the business. And who will censure them when we see so many who have been raised from poverty to affluence by a "lucky strike." Imagine for a moment the feelings of one who after long years of toil and innumerable disappointments finds himself suddenly lifted from a life of laborious servitude with its thousand ills and inconveniences, to a position of independence, where he can surround himself with the many desirable things which wealth alone can procure; and where he excites the envy of the grovelling, unambitious plodder who looks to-day with a frowning sneer upon the prospector who has returned from an unsuccessful search after the coveted treasure; but to-morrow views him with envious admiration when, perchance, well merited but long deferred success has crowned his efforts.

On the other hand let us imagine the feeling of one of an extremely hopeful and sensitive nature, who after months or perhaps years of labor spent in prospecting in a direction where

the indications gave him every reason to hope for a most gratifying success, possibly in some remote and unfrequented region, finds himself "dead broke," with dispelled hopes sitting lonely and dejected on the bank of some mountain stream, reflecting on the uncertainty of human events, and fully realizing the fact that "man proposes but God disposes." And thinking of the happier scenes of "by gone days,"

To these restless, unsatisfied nomads the country is indebted for the discovery of nearly all the valuable mineral deposits which have in the last 28 years contributed in so marked a degree to the wealth of the nation and the world. When we reflect upon the vast amount of wealth that is being annually taken from the mines on this coast and put into circulation, the almost countless number of men to whom it,

MORTON'S IMPROVED NEEDLE CLAMP.

before the restless demon, ambition, took possession of his soul; he reluctantly comes to the conclusion that "what fates decree that man must needs abide," and retires to his meager couch to seek therein temporary oblivion.

both directly and indirectly, gives employment, the stimulus it has given to commerce, and the incalculable benefit this great specie-producing region was to the nation in its recent terrible struggle for existence, and the resulting finan-

AN IMPROVED ORNAMENTAL AQUARIUM.

But even there the restless brain refuses to be quiet, and carries the weary dreamer on the wings of imagination to scenes of splendor, where science vies with art in contributing to the wants and wishes of those who worship at mammon's shrine, and he, for the time imagines himself a "bonanza king," before whom all the lesser lights in the financial firmament bow with a flattering obsequiousness; but he awakes in the morning with a headache, and "stubborn facts and stern realities" staring him in the face.

cial crisis, we have but a faint conception of the magnitude of the benefits flowing from the labors of these unappreciated men, of whom so many people, with little wisdom and less reflection, speak in tones akin to contempt. Therefore I say all honor and praise to those adventurous sons of toil, who, unsatisfied with the slower methods of courting the fickle dame, attempt to win her smiles by the less certain but more romantic and exciting avocation of a Prospector.

Kernville, Kern Co., Cal., Nov. 18th, 1877.

## An Ornamental Aquarium.

We illustrate herewith a new aquarium, patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by Matthew Palen and Daniel Sexton, of San Bernardino. The invention consists in constructing an aquarium in such a manner that a portion of the water can be raised into a chamber or chambers which extend above the level of the water in the main tank or tanks, and sustained there by atmospheric pressure, so that the fish can pass from the main tank into the elevated chamber and back again.

The invention can be applied in a variety of ways, so as to produce mysterious and illusory effects.

That which is the most common so far is represented in the engraving. It represents two reservoirs or vessels of an aquarium, set a short distance apart. An arched or siphon-shaped chamber, the sides of which are made of glass and the ends open, form these reservoirs together in the manner of a bridge. The open ends terminate in the tanks. In the top of this arched chamber is placed a valve at the highest point, and means are provided for attaching a single air-pump over it, so that when sufficient water is admitted to the two tanks the air in the chamber is exhausted through the valve, so that the atmospheric pressure on the water in the tanks forces it up into the curved chamber. This pump is then removed and a perfect semi-circular column of water will be maintained in the arch, into and through which the fish can pass from one reservoir to the other, producing a peculiar and interesting effect.

This same device can be used in a single tank if desired, the only necessity being that the open ends of the curved or other shaped chambers be submerged below the surface of the water in the tank. This column of water will thus be maintained for a long time, and when fresh water is supplied to either tank, a circulation will be established through the arched chamber, which will keep it fresh.

A very pretty combination of an aquarium and bird cage is formed, which we will describe in a future issue. A handsome aquarium can be made by this ingenious application of philosophical principles, and a variety of forms can be manufactured.

The invention can be applied in this and various other ways, so as to give peculiar and apparently mysterious effects. Parties wishing the rights to this invention can get them very reasonably by addressing Dewey & Co., 202 Sansome street, San Francisco, or the above-named inventors. Some excellent samples can be seen at Hermann & Co., 630 Washington street, San Francisco.

## Improved Needle Clamp.

We illustrate on this page an improved needle clamp for sewing machines, invented by Joseph V. Morton, Winchester, Clark county, Kentucky.

A, Fig. 1, is the needle-bar, which is boxed longitudinally to receive the rods B and C, Fig. 2. On the lower end of rod C is a wedge-shaped projection, which is fitted in a slot in the bolt D, said slot being widest at its lower side. The bolt, D, has a head, and cuts a hole horsed transversely through the lower end of the needle-bar. The rod, C, screws into the rod, B, which is of larger diameter, and is provided with a screw, E, which passes through a slot in the needle bar, to prevent it from turning. F is a milled screw that engages a thread cut in the upper end of the rod, B, and which is designed to draw the rods, B and C, upward in the bar. The check lever, G, passes through a slot in the needle-bar and rod, B, and is regulated by screwing the rod, C, more or less into B. The operation of clamping the needle consists in placing it under the head of the bolt, D, and in turning the screw, F, until said head is drawn by the action of the wedge against the needle with sufficient force to retain it.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published on the authority of the writers, for which we do not assume responsibility.

### Mechanical Ore Concentration.

Remarks by Mr. Cazin on Mr. Rueger's "Philosophy of the Hendy Concentrator."

EDITORS PRESS.—Mr. Chas. C. Rueger, M. E., who has served the cause of mechanical ore concentration before this by his able translation of E. Heherle's description of the mineral dressing works at Falun, Sweden, again serves the same cause well by his able paper in your journal, on the "Philosophy of the Hendy Concentrator." I would have more willingly left this exposition of principles to do all the good it possibly could, than to express what may appear as a contradiction or modification, had not Mr. Rueger, after quoting my name, called in so pointed a way at the beginning and at the end of his paper for discussion and criticism, that to remain silent would have to be interpreted as giving full consent in all points.

My chief reason for reluctance against weakening any thing said in favor of Mr. Joshua Hendy's concentrator by any remarks of mine, consists in a recognition of Mr. Hendy as one of the most active and most persevering pioneers of mechanical ore concentration on the Pacific coast, and I have always regretted that a man of his energy spent all his endeavors on one machine, because it bears his name and is his invention. If Mr. Hendy instead, had elevated his views and himself to a position high enough to look over all that has been done, and what is done at present in his field of action, he would certainly have clearly distinguished not only what merits his concentrator has but also the merits of other machines, and would thus have assisted in introducing each for its proper action and purpose, and instead of being the priest of one idol, he would have been the priest of a principle and an art and have done immense good to the cause he works for. And to do so it is not too late. Sanluis may turn Paulus and make himself the general introducer of an art or science, which, by small and large contrivances of the most manifold forms, one day will become the means by which a large amount of wealth is daily saved, which at present either runs to waste or is neglected altogether.

As meritorious as Mr. Chas. C. Rueger's paper is in one way, by elucidating principles in the main correct, as pernicious it is in the other way in fostering that inclination of considering single and special machines as a panacea for more than one purpose. If we hold review among the machinery applied in any one trade and search into the history of such machinery, we will in all trades soon discover two distinct classes, viz., one of successful, permanent machinery and another of sporadic application; and in entering on the details of each class, we will find that they again resolve themselves into two different classes as to details of construction as well as of action. Those which become standard and permanent are, in their action as well as in their construction, simple, compact and easily understood by the common mind without necessitating extensive elucidation of principles. Those which are short lived and of sporadic application are in their action as well as in their construction complicated, attempting not one simple action but a number of actions simultaneously, which, in order to well fit one in the other, require the presence of numerous indispensable conditions. It is peculiar to such machines that in the hands of the inventor they work successfully, but, when changing hands, they soon are thrown out on account of giving too much trouble.

The adventurer, who saw the same machine work like a charm under the hands of the inventor and who thus knows that the machine does perform the work desired, will throw it out, nevertheless, because the most essential part of the working is the inventor himself, who cannot be purchased, and, if he leaves it, unskilled hands and even skilled hands are at a loss to make it work satisfactorily.

He who has experience in the working of ore concentration works, whether the material be crude ore or tailings, knows of what an immense importance it is, in order to make the works not only technically but also financially a success, that all and every apparatus should permanently, persistently and smoothly do its work, and that the apparatus admits of easy regulation and even repair during a run. As a natural result of this knowledge, complicated contrivances hold their place only for a limited time, and one apparatus intended to do two things at once is soon replaced by two, each doing one thing, but in a sure, easy, intelligible and regulatable way. Mr. C. C. Rueger assures us verbally: "It cannot be denied that the working of the Hendy pan has frequently been unsatisfactory." (Page 268, MINING AND SCIENTIFIC PRESS). This fact being known to me by experience and information, together with the considerations expressed above, were my reasons

for not mentioning Hendy's concentrator in my treatise on mechanical ore concentration and separation, and I indeed believe thereby did such justice to the apparatus as I best judged in the premises. If Mr. Hendy will put his action on a broader basis with regard to these matters, leaving to jigs what belongs to jigs, to classification and seizing what belongs to them, not attempting with it more than his concentrator is good for, he will certainly serve our cause better than by making his apparatus a panacea, and by rejecting such others as for limited action in proper places are by far superior and more reliable, and which will work, once properly started, even under care of unskilled hands. After all, such action would prove more grateful in point of honor and finance to all concerned, and a practice in ore treating would be promoted effectively which must bear one day enormous results to the productiveness of the country.

I do not intend to prolong this letter by entering on the details of principles elucidated by Mr. Rueger, although there are points in which I essentially differ from him, but I beg leave to select a few sentences so as to show how the science of mechanical ore concentration, although first become a science by being based on mathematical calculations, has since emancipated itself with the assistance of independent previous experience, for the nomenclature, with which Rittinger more or less labored it, to such an extent as to pay more attention to practical purposes than to theoretical origin.

Mr. Rueger interprets equal falling as "particles assorted according to their equivalent speed of fall in water." This interpretation is not correct, not even by Rittinger, Mr. Rueger's sole authority, because Rittinger excludes those particles which have equal speed in consequence of equal size and density. But the interpretation is equally incorrect by what the trade has actually adopted. Not the speed is the characteristic distinction, there being an initial speed of particles widely differing even for equal falling particles but the arrival, within the same time at a certain optional depth is the characteristic distinction for equal falling particles. The trade deals with classified (graded) equal falling particles with the understanding that these particles all fell the same distance within the same time, and knows that separation of these may be effected even by changing the falling distance only on account of their speed not being the same at all distances (compare my treatise in the MINING AND SCIENTIFIC PRESS, May 5th, 1877). In such matters professional theory has to submit to governing practice whether it likes or not, especially when common sense is in favor of the laborer and contrary to the scientist. Mr. Rueger further states: "It has been accepted as an axiom—almost in rational concentration, that sizing or grading of the material is absolutely necessary to effect a good separation with any concentrating machine." This is in its generality as expressed, a mistake.

Suppose that the separating medium be of such density as to float the lighter material of two particles to be separated, that is, of a density somewhat higher than that of the (specifically) lighter particle of the two, and at the same time of less density than the (specifically) heavier particle of the two. In such case no sizing would be required, because whatever the comparative size may be, a medium of 2.8 or 3. density will separate quartz of 2.5 density from galena of 7.5 by floating the one and submerging the other. Only when the medium is not of the required density and lacking density has to be replaced by motion imparted to the medium or to the particles, the size and shape of particles becomes of importance, but this importance will decrease in the same degree as the density lacking in the medium is more perfectly supplemented by impulse given to the particles or to the medium in reverse direction one of the other. Therefore the "axiom" spoken of by Mr. Rueger is not the general one he represents it to be, although it is such for all successful apparatuses in actual use, as they all manage the application of power to be the minimum required for the results desired, and not a surplus, which could be avoided by previous sizing or classification, and by a division of action.

F. M. F. CAZIN, M. and C. E.  
Bernallillo, New Mexico, Nov. 13th.

### Globe District, Arizona.

EDITORS PRESS:—In treating of Globe mining district in this letter, I wish to say to those who have been there that I refer mainly to that portion of it which lies between Globe City and an easterly line, drawn between the Blue Bird lode, past the Miama to the Byron and Bixby mines, near the westerly end of the San Carlos Indian reservation. This line does not cross the mineral belt at right angles to the general strike of the lodes. To do that it would have to be run about southeast. The extent of country referred to is some seven miles in length by six in width. As the district is said to be 20 miles long by 12 wide, it is plain that I have only seen a little more than one-sixth of the whole. Why it should be so large and why prospectors should have to come 20 miles to make a record of a claim, I know not. It is true that a lode in an outlying section will derive some advantage from its being ranked with the Globe district mines, but sooner or

later there will be new districts organized out of portions of the old.

### Appearance of the Country.

In central and eastern Nevada, as is well known, there are ranges of mountains, five to 12 miles wide, bearing northerly and southerly, and valleys of about the same width intervening. Here there are no such regular ranges. The Pinal mountains, about eight miles south of Globe City, seem to run nearly east and west, and a group of prominent hills between the Richmond basin and the Stonewall Jackson mine have a northwesterly and southeasterly course. The region I am referring to, however, consists of either low, round or elongated hills, with here and there an iron-capped peak, high enough to show from its summit the billowy-looking character of the lower-lying general surface. Except Pinal creek, above and below Globe City, with a mean course for a number of miles something west of north and east of south, there are no real ravines, only gulches and "dry washes," such as cloud-bursts and the rains of thousands of years have gradually excavated. The hills are mostly covered with a rank unpastured crop of perfectly preserved bunch-grass. If water was abundant there would be no limit to the stock-raising capabilities of this portion of the Territory, but the drouth of the past season leaves only a dry hollow where water used to be. A Nevada explorer finds the other vegetation of the district rather different from that he has been used to. For a day or two at the first he does not keep as far from the bayonet cactus as he learns to do after getting a few irritating stabs. He sees fluted and prickly cactus trees on almost every slope, and occasionally he comes on the mescal cactus, from which the Indians get an eatable saccharine bulb as large as a cabbage. It is stated that the plant takes seven years to come to this maturity, preparatory to putting forth its seed stalk, and it is watched from year to year until its time has come. When baked in a sort of kiln heap, I can say that it makes a toothsome, palatable food. The sage brush of the Silver State has disappeared here with the exception of a little white sage, and in its place comes a shrub called the cat's-claw. As its name implies it is given to scratching. Its only redeeming quality that I know of is that when it is dead and its claws departed it makes a fine camp-fire fuel.

### The Country Rock and Lodes.

There is no limit in these hills to the variety of formation. One finds granite, syenite, porphyry, quartzite, slate or shale and limestone of constantly varying grain, color and density. A hill of lightish color is found, on close inspection, to be of fine-grained quartzite with reefs of limestone passing through it and showing silver or copper lodes near the line of contact, with the former as the footwall rock. Another hill with a reddish hue is seen to be of similar quartzite, traversed by slaty belts, and alongside of rich silver lodes a coarse sandstone-looking red quartz is exposed—not ore itself but close to the ore. Then there are dark gray quartzites of a coarse fracture, which can be dug out in square pieces, fit to put into a wall. Through these are seen great lodes of iron rock, running from north 20° east to northeast and the same west to southwest. Sometimes good ore is found alongside of these reefs, but generally they are not attractive to the prospector. The most promising granite formation I have seen is in the direction of the Silver Bell or Kentuck mine, extending on to the southwest past the Monitor and Casket locations, including also the Orion ground. It is a soft granite, resembling that of Lander hill, near Austin, and shows very little iron adjoining the veins. The lodes at this point are from one and a half to five feet wide and promise to make good permanent paying mines. Veins of black and brown spar are found, but such as I noticed were barren. As a rule it appears that copper predominates in syenitic rock, but it is also abundant and rich in other formations. In the lighter colored soft granites I have only seen it once or twice. There are no very rich silver ores in the part of the district I am dealing with, except in the Byron and Bixby mines, and these are very fine, but the lodes generally are of a good size, regular in their course northeasterly and southwesterly and, under development, likely to yield paying quantities of \$100 to \$200 ore.

### Copper Mines.

Next to Globe City there are many promising copper lodes. The Globe mine, located when the Apaches were dangerous, is a lode of great size, showing one chimney of 25 to 50 per cent. ore, which contains, I am told, considerable silver and gold. Its course is northeast and southwest, with an easterly pitch. The footwall rock is porphyritic, very similar to that in which the Silver King mine in Pioneer district is found, the hanging wall rock being limestone with a narrow belt of shale between. The Cadmus mine, now being opened by a San Francisco company, is a strong, fine looking lode, traceable for a long distance. The ore, it is affirmed, yields considerable silver, which increases as depth is attained. Some of the copper veins are capped over with massive bodies of reddish-brown iron rock, and often quite near to them there are deposits of rich hematite. Only traces of silver are found in most of these ores, but in one case I have heard of, high-grade copper ore on the surface gave place to iron 20 feet down, and this to silver ore a few feet farther. The worst thing about these cupreous ores containing silver will be the impossibility of either successfully amalgamating or smelting

them, but when the railroad comes within 30 miles, their value as shipping ores will be enhanced. One or two attempts at reducing copper ores here have been made in the district, but failed because the product could not be sold in San Francisco at a remunerative price.

### Ores and Quartz Mills.

Nearly all the ores I have noticed will require roasting—at least as soon as the mines are opened a few feet below the surface. There are no large bodies of pay ore in sight. The lodes must be developed before quantities can be depended on, and when that is done there will be plenty of work here for many well equipped quartz mills. The Champion mill, 12 miles distant, has been in successful operation for sometime, but I learn that furnaces are to be erected. The Miama 10-stamp mill, six miles off, will be completed in two weeks. Its furnaces are reverberatory four in one range, with but one grate-bar for all. An old Austin ore-roaster would not like furnaces of this sort, but they may be good notwithstanding. The arches and fire-bridge are of adobes, and I fear they will soon burn out. The Miama mine has a good body of surface ore, but is not much opened. Like the mines of Lander and Ruby bills, in Nevada, it is "faulted," but as the vein can easily be found again that ought not to occasion any serious discouragement to the owners.

### Water and Firewood, etc.

There is a stream of water flowing down Pinal creek 15 to 20 feet below the surface. An inexhaustible supply is found in shallow wells, and at the Wheatfields, several miles down the ravine, the stream comes to the surface. Water is obtained in several other places in springs and 20-foot wells, but probably the southwestern half of the district will rely on Pinal creek as the place for mill sites. The scattered patches of pine, cedar, mesquite and hackberry found along the mineral belt will last for several years, the price per cord not exceeding, perhaps, \$5 to \$7. The wooded range 8 to 15 miles off, will furnish lumber, timber and firewood for many years, after which other supplies are sure to be forthcoming if the mines prove good. The distance of the northeastern part of the district from the timber range places it at a disadvantage, but, judging by the yield of the Stonewall Jackson mine and others in that locality, the extra richness of the ore will more than make up for this drawback. Lumber of rather poor quality is at present \$100 per thousand—firewood, \$5.

### Notes.

The weather is very pleasant, though somewhat cold at night. We have had a little ice several times. The magnet of attraction in the district seems to be in the vicinity of the McMillan camp, 19 miles north of this place. I am going over there in a day or two, and will be able, by and by, to give your readers my impressions of that locality.

For the benefit of those men who have neither means nor influence, but who hope to find a rich lode any forenoon, if they could once reach this place, I may add that I have not come as yet upon a single claim where the individual owner is extracting pay ore that will yield him wages. In other sections I understand that it is different, though the "poor man's" mines, I am inclined to believe, are not lying around loose in any great numbers. But as a place for capitalists to make money by judicious investments, this surpasses all the districts I have ever been in.

J. D. E.  
Globe City, Arizona Terr., Nov. 10th, 1877.

THE PECK MINING COMPANY.—At a meeting of the stockholders of the Peck mining company held on the 20th inst., the following named gentlemen were elected a Board of Directors: E. G. Peck, Wm. Sherman, L. B. Jewell, C. C. Bean, J. C. Stebbins, J. F. Place and W. S. Hobart. At a subsequent meeting of the Directors E. G. Peck was elected President, J. F. Place, Vice President, and L. B. Jewell, Secretary. The Peck mine is reported to be one of the richest in Arizona. Located near Prescott, it is one of the few discovered in that Territory which have yet developed a well defined ledge for over 300 feet in depth. It has been worked by Mr. Peck and his associates for the past year under an Arizona incorporation and has paid from the start; the company, with a small mill, located 30 miles from the mine, having turned out about \$400,000 in silver bullion in about 18 months. The Arizona company has recently deeded the property to the new Peck mining company (incorporated under the laws of California), the organization of which is given above. The company has recently bought a new 10-stamp mill, which is now being erected, and which will be turning out bullion within 30 days. It is then confidently expected by the owners that the production will come well up to \$100,000 a month.

WASTAGE FROM A MINE.—On the 27th of January, 1874, L. L. Robinson and William T. Coleman brought suit in the Fifteenth District court against the Black Diamond Coal Company for \$25,000 damages, the complaint being that plaintiffs are the owners of the Los Medanos rancho, Contra Costa county. The defendant allowed a large quantity of debris of his mine, and sand, clay and other refuse matter, to be floated over plaintiffs' land, mixed with water, to the depth of a foot or more, rendering those portions over which it spread incapable of profitably producing vegetation. Judge Dwinelle has given the plaintiff a verdict for \$5,500.

## MECHANICAL PROGRESS.

## A Model Station House.

AN exchange contains the following description of a new station house on the line of the New Jersey division of the Pennsylvania railroad, at Rahway, New Jersey; the writer commending it as a model for western railways to copy from: The station is of brick, in one story and an attic, exteriorly cross-shaped, the long side of the cross along the tracks, and the roof as wide as the transepts of the cross. There are belt courses in the brick, made of experimental tiles, some set in hollow or sharp-ended. Interiorly there is only one story—the attic windows are upper lights to the beautiful saloons of solid wood. The ceilings, like the sides, are of hard, yellow pine, merely varnished. The doors are of hard ash. The seats, which everywhere surround the two saloons, are of perforated maple. There are ten tall windows in the main or new saloon, and two double doors, each with a shallow window above it next to the ceiling. There are no end doors. The seats extending all around the saloons have no legs, merely iron stanchions. The interior side of the transepts is made into the ticket office on one side and retiring room on the other. This part of the room reduces the height of the ceiling one-half, or from 22 feet to 11, in the archway of uniform varnished wood. Thus the lower room, only half the size of the public or ticket-seller saloons, is in full view, and one ticket-seller governs both saloons. The floors are of shellacked yellow pine. In both rooms the gas-lights drop by long tubes from the ceiling, and the heaters are in the uncompleted floor. The lounge windows are tall and square, with round, arched sashes. Exteriorly the wood work is in colors—the frames green, the dies white, and the panels brown. The men's room is about 54 feet long; the women's room about 40. This measurement is to the middle of the arch. But to the women's room is added a baggage room, not connected with it, and opening on the railroad platform. The roof ridges are level with each other all over the building; the use of colored tiles is copious; in the exterior beltings of black, and black and gray arch lines, and the frame chords of sub-sheds are braced on mouldings of white cement. The depot within is like being in a fine cigar box, in which are let cross cells for matches. It cost \$15,000, and is the most perfect country station in America.

## Bismuth Bronze.

A correspondent of the London *Mining Journal* gives the formula for compound bismuth bronze, which he believes will be found of wide usefulness to metal workers. The process is invented by Mr. James Webster. Mr. Webster's object is to produce metallic alloys suitable with or without the addition and admixture of other metals or alloys, as required, for the casting of cannon and other large articles, also ingots, slabs and the like for rolling and for general purposes; and for the production of superior alloys for the manufacture of articles usually made of metals or alloys of metals. For making the hard bismuth bronze or alloy, he takes bismuth, 1 part; lead, 3; zinc, 6; nickel, 15; copper, 25; and antimony, 50 parts; melts them in a suitable pot or crucible and at the same time thoroughly amalgamates them, and then runs the amalgam, alloy or bismuth bronze thus produced into molds of any convenient shape or form for future use, as desired. This bismuth bronze is a hard metallic alloy and may be made into reflectors for mirrors, lamps and the like and into other articles requiring a high degree of hardness or polish; also for axle and shaft bearings, valves and for other similar articles or purposes. It may also be ground into bronze powder and be used for similar purposes to those in which ordinary bronze powder has hitherto been applied.

It will, perhaps, be said that an alloy of this kind would be too costly to come into general use, owing to the high percentage of antimony, and I am inclined to think so myself, except for the purpose of bronze powders, but he also proposes a softer bismuth bronze, which would be as cheap as copper and might be advantageously used for a variety of purposes. The softer kind consists of bismuth, 1 part; lead, 5; zinc, 12; nickel, 30; and copper, 52 parts; the amalgamation of the several metals being effected in the same way as in the case of the hard alloy. The latter admixture forms a very tough metallic alloy and is cast into ingots at once, to be afterwards remelted and cast or rolled or otherwise dealt with as required. These alloys will be found to resist oxidation and keep their color better than any other similar alloy hitherto made and can be produced at less cost.

**FEEDING MINE LAMPS WITH COMPRESSED AIR.**—We read in an exchange that an improved safety lamp is at present being manufactured by Mr. A. B. Bouillon, Sr., of Issy-sur-Seine, near Paris, the leading principle of which is that the compressed air which is furnished to the lamp in quantities just sufficient to insure perfect combustion is taken from outside the mine, or at least from a part of the mine which is free from fire-damp. The exterior air is conducted to the lamps inside the mine by means of an iron pipe.

The air so distributed to the lamps is submitted to a variable pressure according as the lamps are placed at a more or less distance from the reservoir of air or from the cisterns, which can be placed at different points in the mine. The principle of the inventor then rests essentially upon the canalization of the exterior air after the manner of the canalization of gas for the lighting of town. This lamp repels on the one side the carbonate hydrogen gas, while at every instant it is purified from the carbonic acid produced from the combustion; solid iron bars protect and enclose it. The wick is fed with oil by the principle of capillarity; it is necessary only to measure the quantity of oil to know the number of hours one wishes the lamp to burn, or to make a bigger lamp. Fixed at different points in the mine it serves the miner with light in every direction by means of a reflector, which can be turned round at will; however, in case of need, the lamp may be carried by an experienced miner, because small vulcanized india-rubber may be affixed to any of the air taps which are placed along the principal tube.

## The Art of the Die Sinker.

When a die is required for a coin or medals, the engraver takes a piece of soft steel of suitable dimensions, generally three or four inches in length, and about an inch greater in diameter than the coin or other article required; on this he hollows out the exact form of the desired impression by cutting away the steel by degrees, with small, well-tempered, case-hardened tools. As soon as this work is thoroughly accomplished the steel is hardened by being heated red-hot in a crucible with charcoal and oil or bone-dust, and then plunged into cold water. When a great number of coins of one sort are required, the original die is termed the matrix, and copies are made from it by taking impressions from it in soft steel, which is in relief, and is called the puncheon, and from which, when it has been hardened, other dies are produced by pressure exactly similar to the matrix, and in *intaglio*, which are case-hardened in their turn before they are fit to transmit an impression to any metal used for money. The metal used for our coinage, whether gold, silver, copper, or bronze, is stamped in a cold and solid state; but medals and emblems can also be produced by a method called casting *en cliche*, in which the metal is used in a soft state. For this purpose an alloy is used, consisting of one-fourth lead, one-fourth tin, and one-half bismuth, which fuses readily at the boiling point, 212° Fah. When the metal is soft, resembling paste in consistency, the die is placed upon it, and the impression produced by a smart blow from a mallet; the surface of the metal sets instantly, from coming into contact with the cold die, and thus readily retains the form that has been given to it. Copies of medals may be readily made in this way, but each face will be obtained in a separate piece, and these must be joined to give representations of the coin in a complete form. Ornamental work is produced in thin metal for gasfitting, cornices, parts of cruet-stands, trays, etc., by means of a pair of dies, on one of which the pattern is formed in relief, and on the other in *intaglio*, the metal being placed between them, and brought into the desired shape by pressure. Dies are also made in metal for forming articles in gutta-percha and leather, and producing embossed figures on the cloth covers of books, as well as on card-board, paper, etc.

**LOCATING AN OBSTRUCTION IN A PNEUMATIC TUBE.**—The French have a very ingenious plan for locating an obstruction, thus overcoming a difficulty in pneumatic transmission that has often been a source of great expense. It appears, when an obstruction exists anywhere in the underground tubes, its location is determined by firing a pistol into the tube; the resulting wave of compressed air, traversing the tube at the rate of 1,000 feet a second, strikes the obstruction, and is then reflected back to its origin, where it strikes against a delicate diaphragm, and its arrival is recorded electrically upon a very sensitive chronograph, on which also the instant of firing the pistol had been duly recorded. The wave of sound, on reaching the diaphragm, is recorded, and thence reflected back, and a second time strikes the obstacle and returns to the diaphragm. This operation is several times repeated, so that several successive measurements can be made of the time required by the sound wave to traverse to and fro within the pneumatic tube.

**A NEW CUPOLA BLOWER.**—The *Annales des Mines* tells of a cupola in the Cleveland district, furnished with air by means of a jet of steam. It is cylindrical, four feet three inches in diameter and 30 feet high, built of refractory brick with a sheet iron casting. The upper part, by means of a horizontal flue, communicates with a sheet iron column descending vertically into the ground, where it joins an underground flue leading to a chimney. A steam pipe of small diameter enters the sheet iron column, the jet of steam causing a current of the air in the cupola, which is furnished with eight tuyeres two feet above the bottom. These tuyeres or openings may be closed at will. The results obtained were satisfactory, five tons of foundry iron being melted in an hour with it, it is claimed, a saving of five per cent. of coke. There are four of these cupolas which four small boilers are found sufficient to supply with steam.

## SCIENTIFIC PROGRESS.

## The Perpetual Forces of Nature.

Mr. Ralph Waldo Emerson, in a paper contributed to the *North American Review*, talks as follows about the perpetual forces of nature: There is no porter like gravitation, who will bring down any weight you cannot carry, and if he wants aid knows how to find his fellow-laborers. Water works in masses, sets his irresistible shoulder to your mill or to your ships, or transports vast boulders of rock neatly packed in his iceberg 1,000 miles. But its far greater power depends on its talent of becoming little, and entering the smallest holes and pores. By this agency, carrying in solution elements needful to every point, the vegetable world exists. Who are the farmers' servants? Who but geology, chemistry, the quarry of the air, the water of the brook, the lightning of the cloud, the plow of the forest? Before he was born into the field, the sun of ages soaked it with light and heat, mellowed his land, decomposed the rocks, covered it with vegetable film, then with forests, and accumulated cubic acres of sphagnum whose decays make the peat of his meadow. The rocks crack like glass by inequality of contraction in heat and cold, and flakes fall constantly into the soil. The tree can draw on the whole air, the whole earth, on all the rolling main. The plant, the tree, is all suction pipe, inhaling from the ground by its roots, from the air by its twigs with all its might. Take up a spadeful or a buck load of loam; who can guess what it holds? But a gardener knows that it is full of peaches, full of oranges, and he drops in a few seeds by way of keys to unlock and combine its virtues—lets it lie in sun and rain, and by and by it has lifted into the air its full weight in golden fruit. What agencies of electricity, gravity, light, affinity, combine to make every plant what it is, and in a manner so quiet that the presence of these tremendous powers is not ordinarily suspected. Faraday said that "a grain of water is known to have electric relations equivalent to a very powerful flash of lightning." The ripe fruit is dropped at last without violence, but the lightning fell and the storm raged, and strata were deposited and upturned and bent back, and chaos moved from beneath to create and favor the fruit on our table to-day. Go out of doors and get the air. Ah, if you knew what was in the air! See what your robust neighbor who never feared to live in it, has got from it—strength, cheerfulness, power to convince, heartiness and equality to each event. As the sea is the receptacle of all rivers, so the air is the receptacle from which all things spring, and into which they all return; an immense distillery, a sharp solvent, drinking the oxygen from plants, carbon from animals, the essence and spirit of every solid on the globe; a menstruum which melts the mountains into it. All the earths are hurst metals. One-half the avoirdupois of the rocks which compose the solid crust of the globe consists of oxygen. The adamant is always passing into smoke; nature turns her capital day by day. All things are flowing, even those that seem immovable. The earth burns, the mountains burn, slower but as incessantly as wood in the fire. The marble column, the brazen statue burn under the daylight, and would soon decompose if their molecular structure, disturbed by the raging sunlight, were not restored by the darkness of night. Plants and animals burn or perpetually exhale their own bodies into the air and earth again. While all thus burns, the universe in a blaze, kindled from the torch of the sun, it needs a perpetual tempering, a phlegm, a sleep, atmospheres of azote, deluges of water, to check the fury of the conflagration; a hoarding to check the spending, a centripetence to the centrifuge. And this is uniformly supplied. Nature is as subtle as she is strong, and like a cautious testator ties up her estate so as not to bestow it all on one generation, but has a fore-looking tenderness and equal regard to the next and the next and the fourth and the fortieth. The winds and the rains come back a thousand and a thousand times. The coal of your grate gives out in decomposing to-day exactly the same amount of light and heat which was taken from the sunshine in its formation in the leaves and boughs of the antediluvian tree. The earliest hymns of the world were hymns to these natural forces. The Vedas of India, which have a date older than Homer, are hymns to the winds, to the clouds and to fire.

**NEED FOR SCIENTIFIC MEN IN THE INDUSTRIES.**—In the course of a recent lecture at Philadelphia, Mr. W. H. Wabl, one of the editors of the *Polytechnic Review*, spoke as follows: We need, imperatively, the educated skill of scientific workmen in every department of technology, men who can rationally direct the tillage of our countless acres of productive soil, and the rational utilization and cultivation of our forests, that the ignorant impoverishment of the former, and the improvident and criminal destruction of the latter, may not, despite the exuberance of Nature's bounty to this, the richest of her continents, cover her face with the widespread desolation that has converted so many of the fairest garden spots of Asia and Europe into arid deserts; men who can direct us how to tap, with the magic wand of science, the rocky ribs of our hillsides and mountains, and force them to disgorge their hidden treasures;

we need designers and constructors, who shall supply to skilled laborers, in other fields of industry, the tools, implements and machinery which will multiply their productive powers a hundred-thousand fold, so that the products of multifarious industries shall be placed within the reach of the humblest and poorest of us. But above all, the preeminent merit of a widely disseminated scientific training will be to inspire men, who comprehend what science has done for civilization, through patient, faithful, unflinching and unselfish labor and study, with a genuine enthusiasm for the pursuit of truth for the truth's sake, with a keen conviction of the dignity of labor, with a thorough hatred of sham and pretense, and keen pleasure in the consciousness of work well done.

**THE STARFISH.**—The *Independent* says that in a richly illustrated volume on the embryology and anatomy of the starfish, Mr. Alexander Agassiz takes exception to the prevailing Darwinian views in the following language: "While," he says, "the successive appearance of the great types of Echini in geological time—in other words, their paleontological development—is in the strictest harmony with what we know of their embryological development, we as certainly know nothing whatever of the causes which have brought about their sequence in time, in such striking agreement with the sequence in their phases of growth. The case of successive modifications of the ancestral horse, which has so often been brought forward as conclusive regarding the genealogy of the group, although more familiar, is far less complete and much more limited in time than the succession to be traced from the paleontological evidence of Echini. But, while natural selection gives a plausible explanation of like problems among vertebrates, it fails utterly when applied to the majority of the invertebrates, and we have completely failed, thus far, to find any causes for their paleontological development differing from those acting upon their successive embryological stages at the present day, of which we know absolutely nothing."

**COAL AND IRON IN INDIA.**—Mr. Walter Ness, who is under an engagement by the British government to develop the Warora coal fields of Central India, states that in the Warora coal fields there are by computation, 500,000,000 tons of coal within 14 miles. The coal consisted mainly of an 11-foot seam, but owing to the difficulty of native labor, it had to be worked by the long-wall system. It took three or four natives to do the same amount of work done by one English miner. He had some trouble in training the natives to work in the pits, and also as blacksmiths and carpenters, but afterwards they gave him little trouble, as they were amenable to law and order. About 50 miles from where he was engaged in the development of the coal field, there was a hill with a rich vein of ironstone, and he calculated that it contained 3,000,000 tons of rich ore. He hoped that the time would soon come when the seam would be worked, and iron made in India. He said the coal was not faulty, and he had not seen any gas. All the coal raised at present is used for locomotive purposes. The price is 12 shillings per ton, but this would be reduced when the coal could be worked by skilled workmen.

**GEOLOGICAL SURVEY OF BRAZIL.**—Among the more important results so far accomplished by the geological survey of Brazil, says the *Engineer*, has been the discovery of the existence in Brazil, of the silurian, Devonian, carboniferous, triassic, Jurassic, cretaceous and post-tertiary formations, all of them furnishing well-characterized fossils in great variety, and of which large numbers have been collected by the commission for its investigation, and for the purpose of distribution in Brazil and of exchange with foreign establishments. So far no well-defined tertiary has been found to exist in Brazil. The survey has also been very successful in its ethnological researches, especially among the kitchen-middens of Santa Catharina, Parana, San Paulo, Bahia, and the Amazonas, the results of which have been announced in part, although much of interest yet remains to be published. The researches in the coral reefs have been made the occasion of securing numbers of marine animals, all of which add to the resources of the survey.

**VELOCITY OF VIBRATIONS IN EARTH.**—Gen. H. L. Abbot gives an account of his series of experiments to test the rate at which tremors from explosions are transmitted through the earth. He stated that for one mile through drift formation a severe shock gives a velocity of about 8,500 feet per second. The rate for the great Hallett's Point (Hell Gate) explosion was about 8,300 feet per second for the first eight miles and about 5,300 feet per second for the first 13 miles. These estimates enormously exceed those reported by Mr. Mallet some years ago to the Royal Society, the highest velocities obtained by him being not over a third of the lowest and a fifth of the highest noted by Gen. Abbot.

**DUST FROM HIGH ALTITUDES.**—M. Gaston Tissandier and his brother, says *Nature*, have made an ascent from Giffard's aeronautical works, for the purpose of collecting the dust floating in the atmosphere. The method employed has been to condense the moisture of the air and analyze the water and ice thus obtained with a microscope.

# MINING SUMMARY.

The following is mostly condensed from journals published at the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**DAYTON IRON.**—*Cor. Amador Dispatch*, Nov. 24: The Loyal Lead & Co. are now engaged in moving 10 of the stamps belonging to the old Loyal mill on to the Pennsylvania mine (adjoining the Governor) and when they get to running, we expect to see a lively stream of the precious metal flowing through our town, as that company have undoubtedly a large body of very fine rock, easily got, and which according to the last lot milled, will pay at least \$12 per ton. It is useless to say anything about the Governor, as every one knows it is one of the paying institutions of California. I understand that the new drill, worked by compressed air, now running in this company's new shaft, works to perfection; and consequently sinking is progressing satisfactorily, although the rock is very hard. This shaft, when completed, will be, perhaps, the finest in the county. The Crown Point mine, here in town, is also a valuable piece of property. All it requires is the expenditure of a moderate amount of capital to develop the mine to a greater depth. This company have just started up their mill, it having been for some time on account of scarcity of water. The Bonanza mine, also in town, has lately been put in active operation by J. H. Davis, of Plymouth, who is understood to represent a large amount of mining capital, and who intends, if developments look favorably, to bond and purchase the mine. This mine, under the former management, turned out some splendid rock, but owing to lack of capital and other causes, it was not thoroughly prospected. The vein of quartz looks well, and shows a width of from 31 to 6 or 8 feet.

**SPRING HILL.**—*Amador Ledger*, Nov. 24: This mine is located between the Keystone and Talisman properties, both paying claims. It is as likely a site for the development of a first-class mine as can be found in the county. The ripe judgment of John Trelogan perceived this, and that expert miner set to work to organize a company to purchase and develop it. He was followed in the same last week on this mission, meeting with encouraging success. The Spring Hill company is incorporated with 120,000 shares. The property embraces 15,000 feet in length, by 600 feet in width. A shaft exists 12 feet deep, showing a ledge two feet thick at the bottom, the ore prospecting fairly for surface rock.

**FORST.**—The mill of 10 stamps is half built, and all the lumber and tools for its completion is on the ground. The work is to be carried out in such a manner that little difficulty will be experienced in increasing the number of stamps, when it becomes necessary to do so. The concentrators and 10 tons of iron pipe large enough to run a 30-stamp mill are lying at the railroad depot at lone awaiting shipment. The mill is designed for water power, with one of Knight's improved wheels. First-class holding works are in operation over the shaft. The shaft is 8x4 in the clear, 150 feet deep, with a vein at the bottom from 25 to 30 feet wide, 8 feet of which is considered good milling rock, estimated to yield from \$5 to \$12 per ton. There is also a body of ore near the surface which will average in the neighborhood of from \$6 to \$8 per ton. It is expected that the mill will be in running order before January.

**NEWTON COPPER MIN.**—Extensive improvements are being made at the famous copper mine on the road to lone. An engine of 125-horse power has been erected, with a number of large tanks for the precipitation of copper. Things are hustling around the works, giving the idea that the mine is to be worked energetically in the future.

### CALAVERAS.

**MINE SOLD.**—*Calaveras Citizen*, Nov. 24: Two weeks ago we made mention of the sale of the Ferguson and Walling mine to parties below. We have since learned that the purchaser was J. B. Haggin. During the past summer the mill on this mine has been lying idle for want of water, consequently a large amount of ore has accumulated on the dump. We are informed that the number of tons is nearly 1,200. It is valued—judging from the past average—at \$1,000. This mine has been one of the best paying mines in this State over \$300,000 having been crushed out with a five-stamp mill. The only change made was in the Superintendent. Mr. Wm. Clary is now acting in that capacity.

**MILL STARTED.**—*Calaveras Chronicle*, Nov. 24: Garland's new cement mill in Chili gulch was started up Wednesday. The machinery works first-rate and the battery—five stamps—is in the best of order and ready for the future. Quite a force of hands is engaged getting out gravel, and Mr. Garland is pushing things with his usual vim and energy. There is every prospect that the enterprise will prove a paying one, and its success will probably lead to the re-location and working of other claims on the ridge.

**MOUNT TIBOLUS.**—Work is progressing steadily at the Mount Tibolus mine, Mono district. Barton D'Arpling is general superintendent; John Champion, underground foreman. Operations are at present confined to sinking the main shaft which has reached a depth of about 200 feet. No more levels will be run until the shaft reaches a depth sufficient to thoroughly prospect the vein, when a new and larger mill than the one now on the mine will be erected and developments will warrant it. At present everything is showing well at the Mount Tibolus.

**WEST POINT JOBS.**—The water is out of the Champion. Sinking will be commenced next Monday. Porteus & Arthur have recently crushed 17 tons of rock that paid an average of \$105 per ton. West Point is still ahead in the matter of rich and productive quartz mines. A new mill is being erected on the Granite mine. It will be ready for work in a few days. Porteus & Arthur have lately made some very favorable developments in the old John Henry tunnel. They have a rich vein of quartz over three feet thick.

**MOSQUITO CULCH IRONS.**—San Bruno still sinking. Banner rashing things. Have recently struck a three foot vein in south level. Blue Jay has a whim in active operation. Harryhausen is taking out "gray up" rock. His mine is known as the "Sitting Bull." Horseme mine is being energetically worked. Lewis & Fairchild have a veritable bonanza. Grand Central is down 100 feet. Hartwell & Co. are rushing things on their mill site.

### MONTREY.

**QUICKSILVER.**—*Salinas Index*, Nov. 17: A letter from George Shriver, Superintendent of the Salinas quicksilver mining company, to the Secretary of the company at this place, conveys the welcome intelligence that the shaft connecting the upper and the lower levels in the mine was finished last week and the mine is now opened. The work of taking out ore was commenced the first of the present week and will be kept up all winter. This puts the mine in good shape and makes it a valuable property. If the rains hold off a few weeks, so as not to spoil the mountain roads, the company will probably ship ore enough this fall to declare a dividend.

### CONTRA COSTA.

**EMPIRE COAL MIN.**—*Contra Costa Gazette*, Nov. 24: The work of developing the Empire coal mine, as we are informed by Mr. Alexander Riddick, is being prosecuted by the owners with unflagging energy and large outlay of capital for the advantageous cutting and raising of the coal. The slope is already down 900 feet, with a gangway turned in the vein on that level, where a water lodgment is to be sunk 40 feet and a pump set for raising the water, one being already at work in the 600-ft gangway. The slope is to be immediately extended down 300 feet farther on the vein, where another gangway will be run and an shaft driven from that depth, which will also be permanently used for raising the water and coal from the mine.

The hoisting drum of the engine is also about to be changed from one of seven to one of 12 feet in diameter, with a 40-inch face, capable of carrying rope enough for hoisting from a depth of 2,200 feet. The railroad of three feet gauge, for delivering the coal into barges at Antioch, is completed and equipped with cars and a Baldwin locomotive of the most approved construction for a heavy grade road. Messrs. Judson & Belshaw, the principal owners of the mine, are large consumers of coal in their powder, candle, chemical and other manufacturing works, and will soon be able to supply themselves with fuel from their own mine as well as to furnish other customers.

### INYO.

**SALE.**—*Inyo Independent*, Nov. 17: M. A. Wheeler, owner of the Swansea furnace property, has purchased the San Benito mine, Cerro Gordo, from L. Lasky, of Lone Pine. The San Benito is among the oldest locations as well as one of the richest galea mines on the hill, and the sum paid therefor, \$17,000 as reported, is but a small fraction of its true value.

### NEVADA.

**WATER.**—*Nevada Gazette*, Nov. 24: The miners have plenty of water now to commence working their placer mines. We have some of the best mines of that class in the United States in the United States, and when all the mines are working, there will be better times here, and people in this town, we mean business men, will not be crying about money being so scarce that they cannot get enough to keep up their business. The cry is not only in this town, but it has been the same cry all over this State, and also in the Eastern States. We will have to wait and pray for better times.

**GOLD.**—*Nevada Transcript*, Nov. 25: Philip Richards, the banker, showed us yesterday, at his banking house, 13 bars of beautiful gold which he had received in small lots, and which was assayed and run into bars by J. J. Ott, the assayer. The total value was about \$5,400. It was good for sore eyes, these hard times, to look at.

### PLACER.

**RATTLESNAKE BAR.**—*Cor. Placer Argus*, Nov. 24: Mining is not so important an industry here as it used to be, but there are some still engaged in it who are confident of success. Messrs. Boles & Avery are fitting up a large claim in Mormon ravine, at a cost of about \$1,500. They have about 100,000 feet of bedrock flume, and nearly 900 feet of flume sections of track, and have recently a branch of the Bear river for five years for \$1,250. They have also some 10-inch iron pipe and a Little Giant hydraulic contrivance, and all the work is done by white labor. Mr. Boles is confident of being well repaid for his trouble and outlay when he gets his claim well opened. The bedrock sluices are all inch and a half plank. The main flume is fitted up and changing their hydraulic pipe in anticipation of the rainy season and big pay. The next mining claim is J. H. Campbell's, below us. He mines summer and winter. Schofield & Co. have bought a large amount of mining ground on the opposite side of the river, and have leased the Georgetown ditch for the purpose of working this old and new mines on a large scale. Myers, Ormsby & Co. are going to work out the old Kentucky mine, where most of the rich tailings of Wild Goose were dumped. Then there are Kelly's, and Hutch & Hawkin's claim that pay very well, besides some other claims worked by Chinamen.

**YANKEE JIM'S IRONS.**—*Placer Herald*, Nov. 24: The Georgia Hill claim, one of the most extensive hydraulic mines in this district, is thoroughly fitted up for the washing season, but owing to litigation, which has allowed certain parties to enter the claim, and have recently supplied them with water, there is some doubt whether this coming winter the owners will be able to obtain a supply of this essential element. Trafton's claim, next to the Georgia on the west, and one of the largest on the hill, having a breast of 1,200 feet and extending back nearly a mile, is being thoroughly prospected by the running of a bedrock tunnel, calculated to tap the channel. In the morning, Mr. Trafton is getting his ditches ready, with the view of washing some this winter. The Gilbert boys have their claim on the old Yankee Jim's channel in fine order for washing whenever the water comes. Having a large amount of dirt loosened up and their pipe and other fixtures all in position, they will, with a favorable water season, make a big run. Hodges & Trafton, on the north rim of the Yankee Jim's channel, have their claim, the "Rolling Jockey," nearly cleared out and ready for working. This is a new placer claim, consisting of about 40 acres, which the parties have recently taken up, and though its richness has not been proven by actual operation, it nevertheless prospects well. This quartz discoveries made in this district last summer are being followed up by pretty thorough prospecting, which is attended with more than average encouragement. Within the last few weeks other quartz discoveries have been made by the Gilbert boys, above Yankee Jim's, in Devil's canyon, which seem to be creating even more attention than the first. On this new lead the Gilbert boys have located 1,500 feet and James Hodges 1,500 feet. Two quartz claims, the Coon Trail and Narrow Gauge, are being worked with fair prospects. In the Narrow Gauge they have a four-foot ledge of placers, which assays about 80%. The "No Yes Don't" mine, which has been made and will not be lacking in force fuel when work begins and the tools need sharpening. Altogether the prospect for a busy season at Yankee Jim's is good, but whether it will be realized or not depends on the character of the winter, whether it be wet or dry.

### SAN BENITO.

**MINING AT TEOPA.**—*Cor. Semi-Tropical*, Nov. 24: The reports from our northern mines are at this time most decidedly encouraging. We learn from parties just in from the Resting Springs country that Mr. Osborne has gone to San Francisco for the purpose of procuring a smelting furnace which will have a capacity of 40 tons per day. Their present quartz discoveries have proved to be inadequate to meet the demands that were being made upon it. The mine recently discovered by Mr. Leach in the neighborhood of Resting Springs is proving to be considerable of a bonanza. The owners have sunk less than 30 feet on it and have already taken out \$15,000 worth of ore and have a vein of four feet in width. The ore from this vein assays \$225 per ton, while at least 100 inches of it will work over 1,000 per ton. The owners have been offered \$30,000 for their mine in its present undeveloped condition, but they say they have more than that in sight and consider it worth \$100,000. On the success of these mines rests very much of the future prosperity of this valley, as they must draw largely on us for their supplies of hay, grain, vegetables and fruits.

### TUOLUMNE.

**MINING PREPARATIONS.**—*Tuolumne Independent*, Nov. 24: Messrs. Reimington & Co. have begun the survey for a mining ditch at Summit Pass, near Columbia, preparatory to commencing to work the ground they filed on some time since. Mr. John P. Dart ran a line for them day. Their present quartz discoveries have proved to be inadequate to meet the demands that were being made upon it. The mine recently discovered by Mr. Leach in the neighborhood of Resting Springs is proving to be considerable of a bonanza. The owners have sunk less than 30 feet on it and have already taken out \$15,000 worth of ore and have a vein of four feet in width. The ore from this vein assays \$225 per ton, while at least 100 inches of it will work over 1,000 per ton. The owners have been offered \$30,000 for their mine in its present undeveloped condition, but they say they have more than that in sight and consider it worth \$100,000. On the success of these mines rests very much of the future prosperity of this valley, as they must draw largely on us for their supplies of hay, grain, vegetables and fruits.

### NEVADA.

**THE ENGLISH COMMISSION.**—*Eureka Sentinel*, Nov. 23: The English gentlemen composing the Richmond commission were to have taken their departure this morning. Concerning the Richmond property, we are creditably informed they were entirely satisfied. The mine is even more valuable than they had been led to believe before leaving London, and regarding its permanency and marvellous richness they have not a particle of doubt. Their report to the English shareholders will be, as a matter of course, highly satisfactory, thus enhancing the value of Richmond shares, and also indirectly benefiting our district. We are glad that these gentlemen go away so favorably impressed; but it is nothing more than those of

us familiar with the great resources of Eureka district and the Richmond mine in particular had a right to expect. The good words that the members of the Richmond commission are sure to speak for us beyond the Atlantic may possibly induce other foreign capitalists to seek investment in the district.

**METAMORAS FURNACE.**—*Eureka Republican*, Nov. 24: These works are now completed and are a credit to the district. The building is a very substantial structure, and is of sufficient dimensions to admit of another furnace, which the company have in view of the coming spring. The furnace will be started up on Monday morning, and the most successful run will be the result. The coal bin is full to overflowing, and the dump has hundreds of tons of rich ore in store, sufficient to keep the furnace in full blast for a couple of months. Most of this is custom ore. The mine is being energetically worked, and every stroke of the pick demonstrates a growing richness of the property, surpassing the most sanguine expectations of the managers. The new hoisting works will be completed in a few days, when the extraction of ore will be resumed. The dumps have a good supply awaiting shipment to the furnace. Messrs. Steele & Sturges, the managers of the Metamoras, have been indefatigable in their labors, and have placed the property on a most prosperous basis.

### LEWIS DISTRICT.

**PROSPECTS.**—*Eureka Sentinel*, Nov. 20: The papers to the northward speak flatteringly of the prospects of the above district. Two or three mines are yielding well and a mill and furnace are soon to be set in motion.

### MIAMI DISTRICT.

**SAMPLES.**—*Pioche Record*, Nov. 20: Mr. S. R. Nichols, Mining Recorder of Miami district, and who was also Recorder of Ely district in its palmy days and the discoverer of the Pioche and several other mines in this district, brought several samples of ore from there, the other day, to claims in which he is interested, to have assayed, which yielded as follows: Lily May, \$255; Illinois, \$157; Black Bess, \$263.

### NEWARK DISTRICT.

**ORE.**—*Eureka Sentinel*, Nov. 23: Ten tons of ore, from the Battery mine in Newark district, owned by T. Saffar & Co., has been sampled at the Metamoras works, and yielded as follows: First-class, \$303.30 in silver and 40% lead; second class, \$294 in silver and 28% lead. We are pleased to hear such good results from old Newark, and think she will yet come to the front as an extensive producer.

### OSCEOLA DISTRICT.

**YIELD.**—*Ward Reflex*, Nov. 20: It is estimated by competent judges that over \$30,000 have been taken from one gulch within the past six months, working an average of not over 20 men, and some of the nuggets found, if exhibited in San Francisco, would create a great furor of excitement and cause a rush to the gold fields. The nugget picked up by the man Darling, while working for Vizan & Co., and run into bars by an assayer of this place, yielded \$3,500, and a few days since there was found on the same gulch by Chinamen a nugget weighing \$300. A dozen or more other nuggets, weighing all the way from \$12 to \$150 have been taken out by different parties within the past 10 days.

### RAILROAD DISTRICT.

**LOOKING UP.**—*Elko Independent*, Nov. 20: The new water jacket smelter for Railroad district arrived here today from San Francisco, consigned to M. P. Freeman. The iron portion of the furnace is complete, and is now paying it are the iron slag-pots, mounted on wheels, and the paraphernalia necessary to a complete smelting outfit. We learn that considerable ore is already upon the dumps and more is being constantly extracted, so that by the time the new furnace is ready for business, sufficient for a good run will be at hand.

### WHITE PINE DISTRICT.

**THE HEXAY TUNNEL.**—*White Pine News*, Nov. 24: Most people in this vicinity are under the impression that this enterprise is lying idle. This is a mistake. Work has been going on there nearly all summer, though no great blow was made about it, and now we learn that the tunnel has penetrated a quartz formation, carrying streaks of ore which assays \$10 to the ton and gives encouraging hopes of near approach to an ore body. If this company had during last season expended a reasonable amount in the development of their property, there is every reason to believe they would now be in possession of a valuable mining property. We hope the late favorable indication will stimulate them to prosecute more active operations than they have heretofore done. A gentleman, whose name we did not learn, arrived here from New York a few days ago, who takes charge of the mechanical department of the mine.

**THE FAY MINE.**—Superintendent Fulton arrived here from San Francisco the latter part of last week, commissioned to resume work on the Fay mine. A force of men were engaged this week and work commenced. The Fay ore will be reduced at the King company's furnace. This mine has, in years past, produced some very rich ore, and we learn that in lots many of the same kind left in the mine. The machinery for the King furnace arrived from Eureka last evening. As everything else is already fitted up, it will require but a very little time to put this machinery in place. Ten days more will see the furnace puffing away.

### Arizona.

**PECK DISTRICT.**—*Arizona Enterprise*, Nov. 14: Henry Court, a good, practical quartz miner, recently engaged on the Peck lode, arrived in Prescott, Sunday last, and informs us that the mine is looking better and is turning out a greater abundance of rich ore than ever before. While at work in it, he says he often mined out more than \$2,000 worth of ore in lots many of the same kind left in the mine. The machinery for the King furnace arrived from Eureka last evening. As everything else is already fitted up, it will require but a very little time to put this machinery in place. Ten days more will see the furnace puffing away.

**HUMBOLDT DISTRICT.**—Mr. Rowe came in from the Tip-top a day or two ago, and gives good reports concerning it and other mines in the misnamed district. The Tip-top company's mill will soon be running.

**BRADSHAW DISTRICT.**—Work on the Tiger and other lodes in this district is progressing favorably.

**CRICKET CREEK.**—Murt Meselson's mill will soon be running on rich silver ore. The prospects of this old district grow brighter and brighter.

**BLACK HILLS.**—Considerable arastrating and prospecting is being done in the hills to the northeast of Prescott, and it is now firmly believed that the old hills contain almost if not quite as good lodes as those of the Sierra Prieta.

**LYNK CREEK DISTRICT.**—Continues to send to Prescott her quartz ore from quartz and placer mines.

**BIG BUD DISTRICT.**—Although not making much fuss, has lots of the stuff to do it with, and will yet give a good account of herself.

Messrs. Roberts & Poland may soon suspend arastrating for the winter.

The Kit Carson company are quietly developing their property, and have some ore here ready for shipping to San Francisco.

New and rich silver mines have recently been discovered in the Tonto Basin region of this territory by Messrs. Boyd, O'Dougherty and other prospectors, who are now at work developing the same. The surface ore assays all the way from \$250 to \$800 to the ton. These mines are situated in a well timbered and fairly timbered region, about 60 miles to the southeast of Camp Verde and within a short distance of Green Valley.

B. H. WEAVER has acquired an interest in the Silver Bell lode, in Humburg district, out of which he expects to grow rich.

GEORGE CLARK, a California mining expert, is looking at mines belonging to George Monroe and others, in the Bradshaw mountain country, with the view of purchasing them.

**THE SENATOR.**—We sincerely hope that this fine mine will not long be permitted to stand unproductive. With good business management it can be made to pay, and there is a mill on the ground, we hope local capitalists, to whom its late manager, Mr. Fredericks, is indebted, will form a company and work it.

**YUMA MINE.**—*Arizona Sentinel*, Nov. 24: The Yuma mine, near Tucson, in which Judge Porter has an interest, is about to be one of the largest mines in the Territory. The claim takes 3,000 feet of the best part of the ledge. On this they have sunk a shaft 35 feet. From the bottom of the shaft has been run a cut across the ledge 20 feet, all in metal. Another shaft is down 15 feet and a tunnel has been run in 30 feet on ore creppings. From these openings have been taken some 200 tons of ore, now lying on the dumps. The ores are chiefly galena, rich in silver. The Virginia mine, a late discovery in the same vicinity, is being vigorously prospected by Dr. Goodwin for himself and Judge Porter. A working test will soon be made by both furnace and arastra process. The lowest assay yet made gives over \$400 per ton. The vein is wide and of great extent.

**CATTLE DOME** appears to be getting ready for another season. The Bonchontos is down 150 feet on five-foot metal, from which comes 12 tons of ore. The lead is getting one ton a day from the old Arkansas. The Old Nagle miners are still turning out two tons of lead daily, and have 40 tons ahead of the team. Bonard & Johnson's works are stopped on account of a row between them.

## Colorado.

**CAMP TELURIDE.**—*Boulder News*, Nov. 17: It may be owing partly to the late inclement weather, and partly to other causes, but the fact is that mining in this vicinity has been at a standstill, and the outlook is less encouraging to the majority of our residents than at any time within the past year. But still there is something doing. Work on the Eclipse in driving a westerly drift is still going on, and probably will go on while the vein continues its present value. F. Transue is also at work in the gulch, and is taking out this yellow stuff. John Dupuy is also at work on his gulch claim, and admits he is having some success. Wurtz & Co. are at work on the Dime lode, and one or two other claims in the same vicinity are being worked by other parties. The concentration mill of Mr. Crisman is shut down at present writing, but will undoubtedly be going again as soon as a supply of the proper kind of ore can be obtained. Being at Salina a few days ago I tramped up the hill made famous by this mining lode, and found several men at work sinking up a shaft-house on the Cincinnati lode. This lode has a pay vein of about 14 inches, and though its depth is a mere prospect hole, the ore it furnishes is a compact mass of good-looking stuff showing gray copper and sylvanite thickly spread through it. This lode, as also the Omar Pasha, is located near the Beezie Tunnel. The Omar Pasha is now being worked by A. N. Burchill & Co., and is, like the Cincinnati, a most promising lode. I hear that work is soon to be resumed on the Telluride tunnel, near the mouth of Gold run, and hope it is true.

## Dakota.

**MILLS.**—*Black Hills Miner*, Nov. 16: There are now 50 stamps employed in reducing the ore of the Blacktail lode. The 20-stamp mill of the Blacktail, the 20-stamp mill of Foot & Hildebrand and the 10-stamp mill of Whitney & Co. The mine is the property of Major Welch, of the Welch house, and J. B. Pearson, Esq., Superintendent of both the mine and the mills being under the control of the latter gentleman. We understand that the ore body is almost practically inexhaustible, and carries out of over average grade. Good results are very confidently expected.

## Idaho.

**LAST RECEIVED.**—*Idaho World*, Nov. 20: From a letter received by Ralph Goodfellow, from Atlanta, a few days ago, we learn that splendid rock is being taken out of the Last Chance mine. Baxter's mill will run this winter on rock from the Leonora mine, which is looking well at present. Several of the boys in that burg, among whom are R. Turner, Wm. Butler and Wm. Groves, will spend the winter in the East.

**CHUCKLE CANYON CREEK.**—Hon. J. H. Hawley informs us that a big strike has been made in the Ebenezer mine on Canyon Creek. The first rock milled from this ledge was from the surface and yielded \$125 per ton. With this encouragement the company ran a tunnel to tap the ledge and open up the mine for stoping. A vein of from six inches to three feet in width was reached, and supposing this to be the same that had been discovered on the surface, the work done this season was completed at this point, where the rock on which the last run made was obtained. In extending the tunnel on the vein to tap the shaft, it was found that, although in the same ledge, which is 30 feet in width from wall to wall, they were on separate pay veins. A crosscut being run, the vein on which the shaft is sunk was found, running parallel with the other. Being tapped in several places, the average thickness was found to be from four to six feet, as rich if not richer than heretofore extracted from that mine. This strike, which is considered enormous by all who have seen it, is very encouraging to other mine owners in that section. Work will now be done on a larger scale and Canyon and Fall creeks will yet be numbered among the leading mining districts of the coast.

## Utah.

**BEAVER CREEK.**—*Shanties Cor. Salt Lake Tribune*, Nov. 18: I have just returned from a visit to Frisco, the coming burg of this county, and I found things there decidedly lively. The Frisco smelting company is now receiving large quantities of ore from Star and the surrounding districts, and is making lots of high-grade bullion. The large building now being erected by the miners of the great Horn Silver mine to enclose three new stacks is fast approaching completion. Water is found in abundance. The leaching process has a fair trial, proved a success on some classes of Horn Silver ore. Harris & Thackeray made the trial at Frisco yesterday, before the owners of the mines, and worked the ores up to 80% of the assay. Arrangements having been entered into satisfactory to both parties, Messrs. Harris & Thackeray will immediately begin to erect the works on a large and extensive scale. This will be the beginning of a new era in the working of silver ores on a reliable and economical scale.

**COPPER MINES.**—Not only do silver and lead abound in these parts, but deposits of copper also, and efforts are being put forth to induce copper sharps to try their hands at making copper ingots.

Some rich discoveries in the way of high-grade silver ores have been lately made.

**MINING PROPERTY IN PICTAL CANYON** has advanced 50%. The Commercial mine, in this canyon, owned by James Laselle and D. McNamara, has, by late developments, exposed a five-foot vein of high-grade ore.

**SAXBY.**—In my last I mentioned the fact of the Flagstaff mine being shut down and the machinery moved out by Mather, Geist & Ruston to the mill purchased by them some time ago. Many persons here labored under the idea that it was only temporary, on the ground that lead would soon come up, and the legal owners of the furnace would come to the surface and make Sandy sink. But lead has not advanced much, neither can any new find the furnace, and the consequence is the machinery that many expected would be soon put back from whence it came, has been sold to different parties in Parley's Park and Leeds, and the remainder is offered to the highest bidder for cash. This fact has caused many enterprising citizens of this place to look on Sandy the coming winter as likely to be dull, which from an appearance your correspondent can't help thinking is correct.

## Trees and Rainfall.

No. 2.

[Written for the Press by SAMUEL PURNELL.]

## Nature's Revenge.

The superficialist, when viewing the desert and its ruined memorials of the former grandeur of its people, is apt to feel sorrow and pity for the wasted land and the misery of its inhabitants; but this should not be so, for it is, in fact, but the working of nature's revenges against her despoilers and is a fitting and just punishment for destroying the rain-producing forests. When a people, in their ignorance and selfishness, destroy their forests, they are uniformly and deservedly punished by extermination, inasmuch as their home is made a desert. All countries that are heavily wooded are favored with copious rains because they are wooded, and are wooded because of the rains. Grass and shrubbery cannot long grow or flourish far away from the influence of forests, as grass cannot by its own rain-producing power sustain itself. To increase the means of physical and mental pleasure and to furnish subsistence for larger numbers, the soil should be stimulated to its highest productivity. This productivity cannot, however, be obtained by clearing away the forests and thereby increasing their area of plow-land, but rather by retaining a due proportion of forest and bestowing additional labor upon the remaining land. The desert is even now approaching many a fair valley and the sand is destined to cover many portions of the earth now occupied by powerful nations, because they are destroying their forests and are inviting and will receive the desert. The same causes will produce the same results as of old.

## The Effect in Our Own Country.

Turning our attention now to the influence of trees upon rainfall in our own country, we are met upon the threshold with the fact that throughout the entire country east of the Alleghany mountains more than half of the primeval forests have been destroyed, and the rainfall is much less than it was a century and less ago. The summer rains, upon which the fertility and inhabitability of a country must chiefly depend, are greatly lessened, and scarcely serve once in five years to produce fair crops. Long continued drouths during the summer season occur with alarming frequency in districts where 50 years ago a scarcity of rain was unknown. Creeks that within this century flowed past sylvan banks and grassy meadows, hearing to the sea the water of a thousand springs, now flow by bare hills seamed with gullies, and by hazy and sedgy fields, carrying so little water as to be often dry during the summer. The memories of the old men are burdened with such narratives. The mountains of central and southern Pennsylvania have been denuded of their forests, and no longer does the Susquehanna send its wonted volume of water to the sea. The great rivers of western Pennsylvania are considerably diminished in flow, but not materially, as the forests around their sources, being in rugged and distant mountains, remain for the most part undisturbed. Throughout the entire New England States the small streams are gone, and they can no longer suffice to turn the wheels of the mills. The Connecticut river no longer carries a large and constant stream, but by the clearing of the forests around its sources, has been converted into an ordinarily insignificant stream, and during periods of rainfall into a raging torrent.

While the mountain streams of the Atlantic coast are diminishing, and threaten to become extinct, except during the time of rainfall, still more calamitous has been the effect of tree destruction upon the climate. In some districts the mean annual rainfall is not materially reduced, but its usual and necessary form of distribution is altered. Where once rainy summers were known, they are now unknown, and the rain falls mostly in winter. In many districts farming can no longer be made profitable, as the summer rains often fail, and drouth destroys the growing crops.

If we ask for the

## Reason of this Failure of Rainfall

We are able in reply to assert that it is not due to any cosmical causes, but that it is wholly owing to the ravages of man in his endeavors to rob nature of her leafy covering and transpiring forms in order to minister to his selfishness and greed. A century ago the Atlantic coast was densely wooded; both summer rains and winter snows were abundant and in season; the climate was temperate and even, and the earth smiled with the harvest. At present these conditions are materially changed. With a strange ignorance of forestry, and a curious disregard of all the instincts of natural self-defence, the people have allowed those called "owners" to fell the forest that all have so great an interest in preserving, and to bring approaching desolation upon an entire territory. While ignorant of the causes and the remedy, they notice the unfavorable change of climate; that the summer rains are failing; that great storms with deluges of rain are more frequent and more destructive; that the streams are drying up; that the summers are becoming dryer and hotter, and the winters more stormy and cold. These results may be justly charged upon the unrestrained

and indiscriminate destruction of the forests; and that it is no worse is in consequence of the custom of Eastern farmers of preserving some woodland for domestic fuel, to the immense consumption of coal, and to the fact of a few primitive forests still remaining upon lofty and remote mountains, where it would not "pay" the despoilers to venture.

## The Prairies

Of the Valley of the Mississippi river, and its tributaries, possess few forests; yet summer rains usually fall in ample volume to mature crops. These prairies would long ago have been converted into deserts, except for local meteorological conditions. The prairies, as well as the country east of the Alleghany mountains, receive their summer rains by the condensation of moisture from the great equatorial monsoon, blowing from the south Atlantic, following the Gulf stream to the shores of Louisiana and entering the low lands of the Valley of the Mississippi. The monsoon being a hot wind, and saturated with moisture at a high temperature, as it blows over the cooler land is itself cooled below its dew-point and precipitates most of its moisture in copious rains. This moisture is quite rapidly precipitated, the rainfall being 50 inches or more in Louisiana and only half as much in Illinois. Were the prairies well-wooded far more rain would fall upon them in summer. Although the Valley of the Mississippi now receives its summer rains from the tropical monsoon over the low lands of Louisiana, even without the aid of forests, the case would be far different if the northern shores of the Gulf of Mexico were lined by high and snowy mountain. Then the monsoon moisture would nearly all be caught upon the mountains and very little would cross them to fall as rain upon the prairies. The latter would become as dry during the summer as the interior of California, and without irrigation be as sterile and uninhabitable. There could be no recourse against their inhabitability except to artificially cover them with forests.

The hypothetical case of the Mississippi valley is in fact that of Peru; the same wind that blows the moisture from the south Atlantic toward the Gulf of Mexico, blows also across Brazil toward Peru, but its moisture is nearly all extracted by the snowy summits of the Andes mountains, forming the sources of the mighty Amazon, while Peru upon the west slope receives scarcely any rain at all. The same substantially may be said of the entire western coast of equatorial America; and the western coast of Mexico. As to the California coast it will be shown hereafter that the Atlantic monsoon never reaches it.

## Eucalyptus Wood and Growth.

At the meeting of the California Academy of Sciences on Monday of last week, there was a discussion with regard to the fire-resisting qualities of the eucalypti, in the course of which some facts were brought out which will be of interest to our readers. At a previous meeting Dr. Behr had referred to a eucalyptus, standing in the grounds of the old German hospital, on Braman street. "The tree had passed through the fire of August, 1876, and exhibited the peculiarity of resisting the action of the flames, a property well understood in Australia."

Mr. F. T. Newberry, at the last meeting, referred to this assertion of Dr. Behr's and also to the following paragraph, clipped from the papers, and purporting to be the remark of Dr. Kellogg in connection with that of Dr. Behr: "Dr. Kellogg stated that eucalyptus shingles were in common use in Australia on account of their being fire-proof. It was impossible to fire a roof made of this material. There were some 132 species of eucalypti, but all seemed to possess this non-perishable quality to some extent."

Mr. Newberry stated that he was a native of Australia and brought up in the country, and was familiar with the genus eucalypti, from the tropics to the snowy mountains, having resided in Queensland, New South Wales, Victoria and South Australia. Mr. Newberry said:

"What I know of eucalypti, gentlemen, is diametrically opposed to these statements of Drs. Behr and Kellogg at the last meeting. I have to say that I am familiar with the terrible brush fires which ravage the country nearly every summer, having had to fight them more than once; nothing can exceed the fierceness with which the fire seizes on these living trees, running from the butt up to the topmost branches, enveloping the whole tree in a mass of flame in an instant. A great number of these trees being hollow, they offer a good hold to the fire and are speedily burned to the ground. The settlers would be amazed to learn that one should use these trees as a defense against fire. The fact is that they clear a wide space between the forest and their line of fencing; their chief dependence there when the brush fires threaten their improvements is to run a plow around their farms outside of their lines of fencing. Of course the exuberance of their foliage would shelter a building from the scorching heat of proximate conflagration, but that they will resist the action of flames is altogether wrong. It is a very common opinion amongst country people that the leaves of these trees take fire spontaneously when rubbed together by the wind during the extremely hot summer days. The origin of three-fourths of these fires cannot be accounted

for; they generally run in comparatively still weather, and consist of isolated bodies like camp fires on a large scale. The fires seldom proceed in one general direction, but spread all around where there is anything inflammable to be met with.

"But the inherent vitality of these trees is something astonishing. I have seen the blackened charred stump the next season put forth clusters of leaves, and aspire again to the dignity of trees of the forest. The eucalyptus is used as firewood for the simple reason that there is not two per cent. in general of any other kind of timber; it is used as much in the green state as in the dry. Shingles and the bark of the stringy bark (*Eucalyptus obliqua*), are the only roofing materials used, excepting a few slates. The best shingles are made of the iron bark (*E. leucocorylon*); the bark is very rough and tenacious, the grain of the wood close, and it splits evenly; but these shingles will burn just as easily as redwood shingles. I have made them, and know that they make very good kindling wood. They often get burned up at the stump by the brush fires while in a green state. I have no hesitation in saying that they offer no more protection to a building than redwood shingles.

"It has occurred to me that, perhaps, the knowledge which I have of this species of timber might be of more useful account to the members of this academy and the public, and I therefore offer the following remarks:

"The species of gum trees cultivated here are not the most ornamental or useful. In this respect there is none surpasses the Black Butt (*E. pilularis*). It is very symmetrical, has a bold, straight barrel covered with bright bark, but the lower limbs and branches contrast beautifully with their clean, silvery bark. The timber is more free from gum shakes, splits easily, and works more economically than any other kind; for timber purposes it furnishes logs generally from three to four and a half feet in diameter, and from 40 to 60 feet in length. The grain is close and hard to cut. It is considered good work for two men to cut on the average 150 superficial feet per diem. I never saw any one who would attempt to cut up a log in the dry state. It then becomes very hard, and almost impossible to utilize except as firewood.

"The forests in general are open and the trees lit for lumber thinly sprinkled among a large number of gum trees properly so-called, the principal of which are spotted gum (*E. maculata*), the white gum (*E. viminalis*), blue gum (*E. globulus*), red gum (*E. rostrata*); also the iron bark (*E. leucocorylon*), and stringy bark (*E. obliqua*). The spotted gum runs up to a good height with a stout, straight barrel, but the quantity of gum in small pockets which is distributed through it make it very difficult to cut, and the timber is worthless wherever these pockets (or shakes as they are called) occur. The trees are split up, however, with mauls and wedges and furnish very good posts. The red and blue gums are very seldom sawed up, the barrels being generally crooked. The timber is close-grained and inlaid; selected portions free from streaks are used by wheelwrights and ship builders. The iron bark is a very fine tree, generally very straight and often 80 and 100 feet clear in the barrels, with a fine and well formed top. It is but seldom used on account of its hardness and of the great difficulty of removing the bark which is hard, thick and very tenacious; it is used for shingles, long girders and piles, but the teredo is found to attack it as readily as pine. The aborigines of the country generally make their spears, boomerangs and waddies of this wood. The stringy bark is anything but a beautiful tree, but it may be considered as the poor man's friend. It is often of large size. The wood is the easiest to cut of any of the eucalypti, being generally open and straight grained and free from gum shakes. It is not so durable as many of the sound wood of the other varieties above mentioned. It is generally hollow and is worked up into shingles, rails and pickets for fences. The bark is very useful for roofing, from two up to five lengths of eight feet each being taken from a single tree. The bark is about one inch thick and very tenacious. It is stripped from the trees either when standing or fallen, and is then laid flat upon the ground for a week or so, weighted down with logs, and is then ready for use. Most of the small huts throughout the country are roofed with this material. If these finer sorts of eucalypti before mentioned were planted here instead of the most worthless, blue and red gums, we could have not only more beautiful trees possessing all the well known anti-fibrile qualities of those trees and equally rapid growth with the common varieties, but useful also as a good sound, hard species of timber."

Dr. Kellogg said that the remarks attributed to him in the papers were incorrect. The statement he made was that some forms of the eucalyptus had the property of not blazing. That in the case of a shingle made of some varieties a hole would burn through in case of a coal falling upon it, but it would not blaze up. That was the only statement he made. He never said the shingles were fire-proof, and the reporters had misrepresented him.

Dr. Behr said that the eucalypti had a certain immunity from fire. The leaves will burn very quickly, but the wood is difficult to set fire to, and is not apt to hold fire. He knew of only one instance of an extensive fire in a forest of eucalyptus trees. The trees are spread over the entire country, in the open or the scrub, in South Australia. There nearly every year large fires occur on the plains. The eucalyptus in these districts frequently showed traces of this

fire, but he never saw a tree destroyed by it. In the scrub, after the fires, the only remaining vegetation was the eucalyptus trees, and they sprouted again. In the one instance I refer to the eucalypti took fire and were burned long before I was there, but none of the settlers recollected the fire, although the traces of it were there.

Mr. Newberry thought Dr. Behr was mistaken altogether.

Dr. Behr said he had resided in Australia several years, and knew whereof he spoke. He had been there for the purpose of studying botany, and traveled in different parts of the country, not confining himself to the cities alone. He thought the eucalyptus wood would give considerable heat when once lighted. When other vegetable growth was destroyed by fire, however, it alone sprouted out again.

Mr. Newberry said that in the diggings he had lighted two green logs of eucalyptus wood two feet thick and they had held fire for two weeks, even in rainy weather. It was green wood also, the dry wood being too hard to chop. He said that in the great "Black Friday" fire in Victoria all the eucalypti were burnt—that is the branches—but the trees budded out again ultimately. He said also that the trees would stand any ordinary amount of cold.

Dr. Behr asserted that the most northern point at which the tree was cultivated in Europe was Geneva. They have been planted in Florence, Pisa, and some places in Southern Europe where they have frosts.

Mr. J. R. Scupham said the trees had been planted in Florida and Georgia, but they did not grow, the frosts destroying them all.

Dr. Kellogg said that Mr. Newberry's remarks were especially valuable, inasmuch as he had called attention to the fact that we are not cultivating the best varieties here, and this he had always thought to be the case. The black bark grows nicely in Oakland. People who plant the eucalyptus should be careful to make a good selection of species. He thought, however, that Mr. Newberry was mistaken with reference to his statement that the teredo attack this tree as readily as it does pine. We have in the academy a specimen which has been in the salt water as a pile, and no teredo had touched it. We had also another piece of common pile which had been alongside of it, which had been bored all through by the teredo. He thought the specimen was of the wood of *E. marginata*.

Mr. Scupham said that the wood of *E. marginata* does resist the ravages of the teredo, the same as the *E. rostrata* resists those of the white ant. Wood of the *E. rostrata* will last as a railroad tie from 9 to 14 years, and in some instances it had lasted 18 years. The reason why these varieties were not cultivated here extensively, was that all the varieties will not grow here. Some of the varieties flourish here as well as in Australia, and some even better, the *E. globulus*, for instance. The *E. cornuta*, *E. siealis* and *E. hemiflora*, grow fast and large, and the *E. gigantea* also. Aside from these, it is difficult even to sprout the seeds of *E. marginata* and *E. rostrata*. These will grow here perhaps six feet in as many years, while the *E. globulus* will in the same space of time reach a height of 60 feet in some places. The peculiar combination of moisture and heat is favorable for some varieties, but not for others. He tried some experiments last year for the Southern Pacific railroad company with these trees. The *E. globulus* and *E. cornuta* were planted in the Colorado desert. They grew all right during the summer, and were from three to six feet high, but the winter frosts of Southern California killed them all.

Dr. Behr thought the growth of some varieties depended greatly on the character of the soil. In some districts he had found the same variety on one side small and apparently stunted and on the other side large and flourishing.

Mr. Scupham stated that he had searched all over the State to find a large specimen of *E. marginata*, and although he had heard there were many, on investigation he had found none more than six feet high anywhere.

Mr. Newberry spoke with reference to Dr. Kellogg's statement about the "iron bark" and teredo. In New Zealand they suffer greatly from the teredo. There they tried every variety and found the iron bark was as worthless as any other kind for protection from the borers. With reference to Mr. Scupham's remarks about the loss of the trees in the Colorado desert by frost, he thought it was more probable that the winds had done the mischief.

Mr. Scupham said the wind belt on the Mohave was about six miles wide and the winds only prevailed in the summer. The trees were all right then. In the winter there was no wind but it was cold and frosty, and at that time the trees died.

Dr. Kellogg thought that Dr. Behr's remarks about the influence of the character of soil were correct. If you go to Mendocino county, you will find the native chestnut with a shaft from 75 to 175 feet in height and six feet through. On a ridge near by you will find the same tree simply a shrub three feet high and bearing fruit. Near here, on the other side of the bay, the chestnut grows up bushy in character and only six feet high. These facts certainly exist, and the climatic conditions alone could hardly amount for the very great difference.

THE dividends declared and paid to date by the bonanza companies amount to \$54,000,000. Of this amount the Consolidated Virginia company has paid \$34,560,000, and the California company \$19,440,000.

## Curiosities of Sleep.

"I wish I could write a chapter upon sleep," exclaims Sterne in "Tristram Shandy," and echoes Sancho Panza's soliloquy: "God's blessing be upon the man who first invented this self-same thing called sleep; it covers a man all over like a cloak." A little folding of the hands to sleep, against the abuse of which we are all specially warned, had a peculiar fascination for Don Quixote's fat squire; and how many of us can hear with complacency the warning knock that announces our shaving water and bids us arise to face the duties of the day? Although sleep is familiar to all of us, it continues to be almost as much of a mystery as ever it was. Physical peculiarities during this oblivion of the senses have been discovered and commented on, but those who have most studied the subject confess their inability to penetrate its inner mysteries. In the "horror of darkness" that fell on our first parent, in the visions of patriarch and prophet, and occasionally in the well-attested confirmation of prophetic dreams, we mortals have examples of sleep that may truly suggest "thoughts beyond the reaches of our souls." To dreaming, which presents such an odd phase of slumber, the attention of such men as Locke, Abercrombie and Watts has been given without any very satisfactory results; but it is rather to sleep and sleepers than to dreams of somnambulism, that we would here invite consideration. That there is something awe-inspiring in the contemplation of a sleeper in that trance, "like death without its terrors," has been finely expressed by poets, and is an undesirable emotion that many of our readers must have experienced.

Despite all our familiarity with this strange resemblance to death, it is as impossible to test the exact moment of our becoming unconscious as it is to account for the apparent duration of our visions during repose; and the vagaries of sleepers have proved an enigma to all the intellect that has been brought to bear on the subject. Like the somnolent Irishman, who, when asked by his employer how he could manage to sleep so much, replied: "Sir, I pay attention to it," people have been known to sleep comfortably for upwards of 24 hours at a stretch; like Quin the actor, and DeMoivre, the mathematician. Old Parr slept away most of his latter days; but among statesmen and generals we are furnished with examples of others who have managed with remarkably little sleep. Stow tells us in his "Chronicle" that "the 27th of April, 1546, being Tuesday in Easter week, W. Foxley, pot maker for the mint in the Tower of London, fell asleep, and so continued sleeping, and could not be waked with pricking, cramping, or otherwise, till the first day of the next term, which was full 14 days and 15 nights. The cause of his sleeping could not be known, though the same were diligently searched for by the King's physicians and other learned men; yea, the King himself examined said W. Foxley, who was in all points found at his waking to be as if he had slept but one night." There is an account of a French woman who for sometime suffered from sleep visitations, varying from three days to a fortnight in duration; and a girl at Newcastle-on-Tyne is said to have slept for three months without waking, which latter process took about three days to accomplish. An extraordinary case is on record of a lady who slept for 20 days when 18 years old, 50 when she was 20 and on one occasion from Easter Sunday, 1862, until March 1863—that is, almost a year—during which state of what physicians call hysteric coma, she was fed with milk and soup, one of her front teeth having been extracted for that purpose. Another emulater of the "Seven Sleepers" was Samuel Chilton, a farm laborer, who, in 1694, indulged in a nap that lasted four months, or from April 9th to August 7th. On awakening he dressed and went into the fields, to find his fellow workmen cutting the corn he had aided in sowing just previous to his long slumber. He had another long nap in the same month, and after the medical pharmacopoeia was almost exhausted in applications to arouse him, only rose up to ask for some bread and cheese, but fell asleep again ere it could be set before him. He came to himself some eight weeks later on, after which these unpleasant somniferous relapses are said to have left him.

They are having a mining war at Central City, Dakota. The miners who took possession of the Keets mine in lieu of arrears of pay still hold it. The latest news is that they have a communication with the Hidden Treasure mine, and contemplate retreat through the tunnel when the fight becomes too hot for them. All efforts at a compromise have failed, and unless the Sheriff burns the timbers of the shaft and attempts to starve them they have the best of the game.

The Southern Pacific railroad has made a reduction in its land rates, and announces that the charge on freight from the anchorage to Los Angeles will be \$2.50 per ton. The rate on corn in car-loads, from Los Angeles to San Francisco, has been reduced to \$5.50 per ton, and on broken lots to \$6.25. The aggregate reduction will amount to about 50% of the old schedule.

A FREE Labor Exchange has been opened at Nos. 33 and 35 O'Farrell street, in this city. No fee is taken from either employer or employed.

## USEFUL INFORMATION.

## Detecting Breaks in Bridges and Culverts.

Now that the season of heavy rains, and perhaps of floods, is upon us, it will be valuable to know how to watch their effects upon bridges and culverts and how to save them from harm. A writer in the *Railroad Gazette* takes up this subject, and we quote a few paragraphs:

It is not always possible to know whether a bridge or culvert has been damaged or not until the water subsides. All may appear safe above the surface of the water, while the work of destruction may be silently going on below. If soundings and probings fail to disclose mischief a close observation of the surface of the water may indicate what is going on below. A whirlpool near the face of a wall is evidence that water has effected an entrance through a crack or that a portion of the wall has been undermined, and water is running back of the wall. A speck of foam, a chip or some light floating substance floating in a circle, on the water, shows that a tiny stream is slowly but surely leading the waters to the work of destruction. If water has found a passage out of the proper channel the quantity and force of the fugitive element may be known by the size of the circle described by floating substances and the velocity of their movements. As soon as water has found a passage sufficiently large to allow of the discharge of a continuous stream, however small at first, it rapidly becomes larger. At first the surface of the water above the aperture will not be disturbed sufficiently to be discernable, except by the movements of floating substances, as above mentioned. These substances will at first move slowly in a continuous circle on the surface, but as the discharge of water through the break becomes greater, the chips, etc., are drawn under the surface and disappear.

If sticks, etc., of any considerable size, are drawn into the whirlpool and lodge in the passage, the lodgment may be known by its checking the flow or discharge of water, which will be evident by a reduction in the velocity and dimensions of the whirlpool. If articles drawn in do not cause any interruption of the discharge, it is evident that they have been discharged below and their appearance should be looked for, which will indicate the direction of the stream which is doing the damage. The "evil," if watched on the lower side of the embankment, may show the nature and extent of the wash. Rocks, trees, logs and driftwood will sometimes form an eddy or back current, which works away quietly below, giving no sign of what is going on, but the action and force as well as the direction of the currents can be ascertained by throwing in blocks of wood attached to lines. Fasten a piece of iron or a stone a few feet from the block of wood on the line, and this will serve to indicate more clearly the direction and force of the currents. If the currents are noticed to carry gravel, clay, particles of cement or any material of which the masonry or embankment is composed, it is certain that destruction has commenced. In this case, perhaps, the most that can be done will be to remove, if possible, the obstruction that causes the destructive currents and throw rubble and riprap where the wash is supposed to be going on. But, of course, action in such cases must be governed by the peculiar circumstances, no two cases admitting of similar treatment. But in case an embankment is being destroyed by the process first mentioned, the work of destruction may be readily stopped by the use of bundles of hay, straw or grass. Marsh hay is preferable for the purpose, but if that is not convenient, other hay, fine brush or straw or weeds, tied up in bundles and thrown into the whirlpool, will effectually stop the wash. When the aperture has been well stopped with hay, etc., it should be supplemented with gravel, if possible.

**SPONTANEOUS COMBUSTION OF COAL CARGOES.**—Some interesting points were brought out at a late inquiry in Liverpool into the burning of the *Flora* in the Indian ocean last August. The court, in giving judgment, held that the destruction of the vessel was entirely owing to the spontaneous combustion of the cargo. There was no evidence before the court, although strict inquiry was made on this point, tending to show that any water had reached the cargo before the 19th of August, when the hose was played over the heated coal. The court could not discover any cause for the outbreak of the fire. As far as the ventilation of the vessel went, it seemed to have been adopted after consideration, as the best and most effective mode of carrying such a cargo in safety. But one experienced ship-master expressed a doubt as to the system adopted, and was inclined to think that the laying of the platform on the bottom of the hold was a mistake, causing too much ventilation, though this was done at the instance of those interested in the insurance of the vessel. The court had before it the "Report of the Royal Commission on the Spontaneous Combustion of Coal in Ships," and was inclined to think that the "surface ventilation" recommended by the commissioners was highly desirable, and to concur strongly in their recommendations that the thermometer should be constantly used and daily registered in their log book.

**How to MAKE PARISIAN COPYING INK.**—The best kinds of copying inks are, as is well known, prepared by adding a percentage of alum, sugar and glycerine or salt to the extract of logwood. Such inks have a violet tint, and gradually become blacker on paper. The copy is, however, very pale at first, and is often indistinct. The Parisian copying ink is distinguished from the common kinds by its appearance, more or less yellow in a liquid state, and by producing a distinct bluish black on paper. It has the additional advantage of preserving its fluidity, while the common kinds soon thicken. Prof. Ghini recommends the following method of preparing an ink which has all the advantages of the Parisian: A strong solution of logwood extract is treated with 1% of alum, and then with as much lime water, so that a permanent precipitate is formed. Some drops of weak chloride of lime are then added so that a perceptible bluish black color is attained, and hydrochloric acid is added by drops till a red solution is obtained. A little gum is then added with 0.5% of glycerine.

**TO BRIGHTEN IRON.**—The following method of brightening iron, which appears suitable for some of the less important parts of large clocks, is recommended by Boden. The articles to be brightened are, when taken from the forge or rolls, in the case of such articles as plate, wire, etc., placed in diluted sulphuric acid (1 to 20), where they remain for about an hour. This has the effect of cleansing them, and they are washed clean with water and dried with sawdust. They are then dipped for about a second in commercial nitrous acid, washed carefully, dried in sawdust, and rubbed clean. It is said that iron goods thus treated acquire, without undergoing any of the usual polishing operations, a bright surface having a white glance. Care should be taken by any one using the nitrous acid not to inhale the fumes.

**DRIVING AWAY RATS.**—Dr. T. C. Smith, of Salem, has made an important discovery—how to rid a building of rats. It is an improvement over the old method of burning the building. First he caught a rodent alive. Next he poured carbolic acid over his ratsnip and then sent him adrift. His brothers, sisters, distant relatives and acquaintances didn't admire the fragrant (?) odor, and concluded to leave for more agreeable quarters. The result was not a rat could be found about the place. Mr. Smith is a real genius and friend of humanity and unborn generations will yet rise up and bless his memory. Portland has a few rats and a fruitful field for testing the merits of Mr. Smith's discovery is presented. Who will try it?

**WATERTIGHT PAPER.**—Packing paper may be made watertight by dissolving 1.8 pounds of white soap in one quart of water, and in another quart 1.8 ounces of gum arabic, and 5.5 of glue. The paper is soaked in the mixture and hung up to dry.

**GUNPOWDER AND COAL.**—The amount of gunpowder consumed in the working of coal constitutes an important element in the cost. It has, says the *Investors' Guardian*, been estimated at one pound weight to the ton.

## GOOD HEALTH.

## Workshop Surgery.

The saving of lives in workshops often depends upon instantly checking the blood which flows from the wound which the operation receives. One of the best instruments known for stopping the blood from a wounded limb is called Esmerch's band. It is an elastic tube which may be passed around the limb as tightly as possible and then its ends hooked together by a handy clasp. This forms a perfect ligature. The *London Lancet* gives some practical rules which should be pasted up in every workshop and in every farm-house in the land:

Rule 1. When a leg or an arm is severely wounded there may be no bleeding; in this case raise the limb on a cushion above the level of the body, and carefully watch the wounded part, so that the first bleeding may be seen.

Rule 2. Should there be much bleeding, put on the elastic tube as soon as possible (see rule 3); but if you have not got the tube near, raise the limb as high as you can above the level of the body, and act as follows:

A. If blood seems to come smartly from one point, place your finger or thumb firmly on that point, and stop up the place from which the blood is coming.

B. If you cannot see whence the blood flows, then roll up your handkerchief or cap, and with it press firmly on the bleeding part, not forgetting to keep the limb raised up.

Note. In case of light bleeding, either of these means just given (rule 2, A and B) will generally be sufficient, the limb being kept raised up.

Rule 3. There is no difficulty whatever in putting on the elastic tube. Let the limb be held up as high as possible, then stretch the tube to the full; wind it while stretched round and round the bare limb, and fasten the hooks at the ends to each other.

Note. If bleeding still goes on after the tube has been put on, you may be sure it is not tight enough. You had better, therefore, with the limb still raised, take off the tube and apply it again more tightly than before.

Rule 4. The tube must be placed above the wounded part—that is, between it and the body.

A. When the leg or foot is injured, apply the tube just above the knee; if the knee or thigh be wounded, then place it higher up on the thigh.

B. If the hand or wrist be wounded, put on the tube below the elbow; if blood come from the elbow or arm, then put on the tube higher up near the shoulder.

Rule 5. If the limb be wounded so near the trunk that you cannot put on the tube, then you must do your best to stop the bleeding by one of the plans named in rule 2.

Rule 6. If the injured man has to be carried far, either to a hospital or to his home, bear in mind:

A. To keep him warm with clothing.

B. To keep the limb continuously raised on cushions.

C. To look out for bleeding.

D. Not to give too much brandy, especially if you have not been able to put on the tube.

## Trials of Life.

We start upon life's journey full of hope, full of gladness, and full of joyous ambition, confident in our own strength and in the support of friends and kindred stationed round about us, on whom we lean with great satisfaction; but as years pass on one of the outposts, the supports, falls; and then another and another, each succeeding year, leaving one or more the less. For a while we scarcely miss the acquaintances and friends of our childhood, for we have so many; but as time rolls on the number becomes so small that each additional loss makes a greater void. Father, mother, brothers, sisters, our old neighbors, all gone; the minister of our youth has grown gray before us—he, too, has passed away; and beyond a schoolmate here and another there, nothing is left to connect us with the times and the home of our childhood, and such a feeling of desolation comes over us that we are ready to sink in perfect helplessness and despair. To the old who may chance to read these lines, the suggestion is made, which, if wisely heeded, may save the body from sinking under the weighing load, and it is this: He who made us is the Father of us all, and the dispensations of this life are designed to prepare us the more certainly for a beautiful existence beyond the grave, and to enable us to make the transition with the least violence, and at the same time to train us to those habits of heart which will the more elevate us in the world beyond; he arranges that we shall learn to lean less on ourselves, less on others, and more on Himself, as the weary man leans on a staff; and the sooner we begin thus to lean the happier we shall be in time, and the more ready shall we find ourselves to take up the returnless journey without a murmur and without a sigh.—*Hall's Journal of Health.*

**INGROWING NAILS.**—One of the deserved punishments which people suffer from the folly of squeezing their feet into narrow shoes and boots is an ingrowing nail. Mr. South recommends the following treatment for its cure. First get rid of the narrow shoe, so that the toe may be unconfined, and the nail allowed to recover its proper breadth, which, however, it does not do very quickly. Then proceed to relieve the sore skin by the side of the nail of its pressure. It is of no use, however, merely to cut away the pressing nail even freely, and then to press a piece of lint under its edge, which is as painful as it is useless; for the nail, if it is not otherwise managed, will drop, in the course of a few days, upon the old spot, and again render it "angry." The proper treatment is thinning the whole length of the middle of the nail, from its root to its end as much as possible; and this is best done by scraping it perseveringly with the sharp edge of a piece of glass, again and again, till the middle of the nail be as thin as writing paper, and will readily bend under the pressure of the finger nail. This is, at first, a rather painful operation; but the scraping must be done with a light hand. As soon as the middle of the nail has been thus thinned, it yields to the upward pressure of the skin on its side edges, readily bends, and offers no further resistance. The sore place being no longer irritated by pressure, the "proud" flesh soon drops down, and the sore heals. If narrow shoes or boots be again used, the foolish wearer may expect a repetition of his plague.

**FISH AS BRAIN FOOD.**—The belief that fish is specially adapted to feed the brain, and that fish-eaters are therefore more intellectual than the average, does not find much favor with Dr. Beard, according to the *Popular Science Monthly*. He says that this "delusion is so utterly opposed to chemistry, to physiology, to history, and to common observation, that it is very naturally almost universally accepted by the American people. It was stated," he adds, "by the late Prof. Agassiz, who impulsively, and without previous consideration, apparently, as was his wont at times, made a statement to that effect before a committee on fisheries of the Massachusetts legislature. The statement was so novel, so one-sided, and so untrue, that it spread like the blue-glass delusion, and has become the accepted creed of the nation."

## The Week.

The week brings to us the annual day of Thanksgiving appointed by President and Governors, and at the same time the day on which every good citizen is supposed to eat turkey, if he never does it any other time of the year. In our own community this year, the day is marked more particularly by a parade of the working-men of the city, which bids fair as we write (Wednesday night), to pass off more peaceably than was at first anticipated, in view of recent events.

The rains, which it was hoped would continue to fall copiously this month, have held off for awhile, and some are dependent on that account, fearing a "dry year." It is too soon for any such fears as yet; let us rather hope for an abundant rainfall which shall make the farmers' hearts glad, and fill to the brim the reservoirs and ditches of the miners. The shortness of the water season last year has given the miners an opportunity to put their claims in such a condition as to utilize every inch that flows. The quartz miners will keep up their end of the load easily the coming year, and make such a total of hullion product as the Golden State has not seen for some time. The recent revival in mining stock circles in this city has called attention again to the mining interests of the coast, and the dull times which have so long prevailed will, perhaps, soon become among the memories of the past. It only needs work, good, earnest work, to develop the riches underground, and more perfect confidence being once established in mining as a legitimate investment, the whole coast will feel the benefits.

THE taxes on the net proceeds of the Comstock mines during the quarter ending September 30th, 1877, are now due and payable.

## Telephones in the Mines.

The telephone which has been placed in the Consolidated Virginia mine is doing its regular duty like any other part of the apparatus of the mine. It runs from the office down to the bottom of the shaft at the 1650-foot level. A fine copper wire is used which is insulated and covered with India rubber or gutta percha. The instrument operates perfectly and orders from the office to the bottom of the mine are transmitted distinctly. This saves a good many trips of the cages, and in case of an accident can be made of very great service. It will undoubtedly be introduced in nearly all the mines before long and replace the old bell and cord signal.

The instrument is being also utilized in the same region for other purposes. The *Enterprise* says: An instrument was attached to the wire leading from the office of the Virginia and Gold Hill Water Company, south B street, to the farthest point on said company's works, near the eastern shore of Lake Tahoe. This wire has heretofore been used for working a printing telegraph. Yesterday, however, Capt. Overton, Superintendent of the affairs of the company, took a telephone and started out along the line from this city. He was first heard from at the reservoir on the dividing ridge between American Flat and Washoe valley, some six miles from the city, he having there halted and connected his instrument with the wire. Every word that he spoke could be distinctly heard in the office here. He then went to Lake View on the further side of Washoe valley, near the foothills of the Sierras, and over 20 miles from this city, following the course of the wire. Again he connected with the wire and again he was as distinctly heard as though he had been but a few rods away. He climbed the mountains and was next heard talking from this end of the long tunnel that runs through the Spooner divide this side of Lake Tahoe. Finally he went to the station at the end of the line, 30 miles from the office in this city, and last evening was talking from that point—away up in the Sierras, where he says there is a foot of snow. When at the terminus every word could be as distinctly heard as one sitting in the Con. Virginia office can hear what is said on the 1550-foot level of the mine by means of the telephone in use there. Wires will probably yet be run from this city to the mills and big flumes up in the mountains; also to the mills on the Carson river.

This really practical invention will be of the greatest utility in the mining regions in the mountains, and will save expense in many ways. It is stated that sitting in the Consolidated Virginia office at Virginia, one may hear by the aid of the telephone the puffing of the compressed air engine, and the rattle and clatter of other machinery in the mine. This being the case, the *Eureka Republican* suggests that a telephone might be introduced into the several drifts and other places where men are at work, when a boss sitting snug in his office on the surface might readily count the pick strokes made or the blows struck on a drill in any part of the mine. Though a man only paused long enough to spit on his hands the little instrument would tell about it. It would make it rather rough on men inclined to "soldier." However, the men would probably soon carry all the telephones into one drift and take turns at keeping up a racket therein. It is hardly probable that the miners will take to the suggestion advanced, kindly.

## Rhizopods.

Prof. Joseph Leidy, the eminent comparative anatomist and microscopist, made his second visit to the West the past season, under the auspices of the Hayden survey. He made a careful exploration of the country about Fort Bridger, the Utah mountains and the Salt Lake basin, in search of rhizopods. He has been engaged for a long time on a memoir on this subject, which will eventually form one of the series of the quartos of the survey.

The rhizopods are the lowest and simplest forms of animals, mostly minute, and requiring high power of the microscope to distinguish their structure. While most of them construct shells of great beauty and variety, their soft part consists of a jelly-like substance. This the animal has the power of extending in threads or finger-like processes, which are used as organs of commotion and prehension, often branching. From the appearance of their temporary organs, resembling roots, the class of animals has received its name of rhizopoda, meaning, literally, root-footed. In compensation of the smallness of these creatures, they make up in numbers, and it is questionable whether any other class of animals exceed them in importance in the economy of nature. Geological evidence shows that they were the starting point of animal life in time, and their agency in rock making has not been exceeded by later, higher, and more visible forms. With the marine kind, known as foraminifera, we have been longest familiar. The beautiful, many-chambered shells of these—for the most part just visible to the naked eye—form a large portion of the ocean mud and the sands of the ocean shore. Shells of forami-

nifera likewise form the basis of miles of strata of limestone, such as the chalk of England, and the limestones of which Paris and the pyramids of Egypt are built. Fresh water rhizopods, though not so abundant as marine forms, are, nevertheless, very numerous. They mainly inhabit our lakes, ponds and standing waters, but they also swarm in sphagnum swamps, and ever live in newest earth. Prof. Leidy has devoted several years of study to the fresh water rhizopods of the eastern portion of our country, and his especial object in the past expedition was to investigate those which are to be found in the elevated regions of the Rocky mountains.

## The Exchequer and I. X. L.

We understand that a report has been forwarded to London to the directors of the Exchequer and I. X. L. mining companies which is unfavorable in its tenor. An expert was sent here from England to examine into the affairs of the company, and from what we hear the report gives a very bad history of past operations. Work at the mines has not by any means been profitable. It appears that the expert speaks in very strong terms about so much outside work being done in the shape of mills, hoisting works, etc., before developments in the mines warranted the outlay. Still, he advises the directors to continue prospecting the mines in an economical manner, in the hope of still finding something which will repay the large outlay already made, rather than abandon the whole enterprise.

The English companies owning these mines commenced work in this district, in Alpine county, some ten years ago. The first thing they started up was a tunnel at Bullion, which, after being run 1,800 feet, developed nothing of consequence, so that after four years work it was abandoned. One lode was found but the money gave out before the other was reached. Some six years ago the English companies bought the Exchequer and I. X. L. properties, but the results so far have been unsatisfactory. We understand that a large amount of money has been spent on the property, which in addition to the purchase money, makes the total spent by the companies in the district foot up to about £250,000.

They have very complete and extensive works. The hoisting works are first-class, as are the mills, of which there are two of 20 stamps each. One of these, we are told, has never been used, there being no ore to mill. There is also an O'Hara furnace on the property. These works have cost considerable, and the report referred to, we hear, suggests further explorations rather than abandon the property where there is such a desirable plant. We hear that the report states that the bulk of the ore in the mines will not average more than \$7 per ton, but there are a few tons of rich ruby ore, picked out now and then, which has been the reason why work has been kept along thus far.

Mr. Riotte, of this city, has also examined the property, and his report varies little from the other one. He says that an idea having been expressed that the ore at the mill contained enough silver but the furnace was at fault, he examined the matter and was convinced that the O'Hara furnace is perfectly capable of working the ores. The ore at the mill worked well but contained next to nothing. This coming from one of the inventors and patentees of the Stetefeldt furnace and one owning stock in the Stetefeldt furnace company, is a good compliment to the O'Hara furnace.

We hope, for the sake of the English investors, that matters are more favorable at the mine than the report infers. A large amount of money has been spent by them, for which they have received no returns, and it will be unfortunate should they be led to abandon the property after such expenditure. We have not seen the report which has been sent to the directors in London, but understand the tenor is as stated. If an opportunity offers we shall publish the report.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: California, Nov. 21st, \$232,859.13; Northern Belle, 19th, \$3,768; Grand Prize, 23d, \$17,100; Manhattan, 12th, \$9,485.20; Con. Virginia, 20th, \$160,712.03; Tybo Con., 20th, \$11,018.13; Alps, 20th, \$1,664; Endowment, 24th, \$2,154.93; Northern Belle, 21st, \$4,109.42; Arizona, 21st, \$1,689.09; Martin White, \$15,721; Comanche, 21st, \$6,681.47; Manhattan, 24th, \$10,788.05; Alps, 27th, \$3,231; Northern Belle, 24th, \$5,754.10; Arizona, 26th, \$2,139.33.

THE San Francisco mint is the most productive institution of the kind in the world. Its coinage last year amounted to \$42,704,500 more than the aggregate production of the three largest mints in Great Britain.

It takes 80,000 feet of lumber per day to run the Consolidated Virginia and California mines. One-half of this goes down the old shaft and one-half through the C. & C. shaft. The total requirements are 2,400,000 feet per month.

By the aid of the newly introduced dryers the tailing mills will probably be enabled to run throughout the entire winter months.

## The Award to the Giant Powder Company.

The Committee in Class 30, at the late Mechanics' fair held in this city, have just submitted their detailed report, although the medals in the class were awarded some little time since. Among other things they award to the "Giant Powder Company the medal for excellence and variety of blasting powders." We have had an opportunity of examining the report, which is a very favorable one to the company and likely to attract considerable attention to the new Judson powder, manufactured by them, in parts of the world where it is not so well known as here. This powder has only recently been introduced and has been received with great favor for certain classes of work. Its principal use is on the large gravel claims. The shattering effect loosens and softens the materials, so that, when the water is put on, the dirt is washed away better. The black powder does not shatter so much but breaks the land up in large lumps and bowlders. The bank is jarred more in depth with the Judson powder and it softens the material.

The Committee visited the works of the company in Golden Gate park, and inspected the appliance and process of manufacture, witnessing also some experiments. In the report they state that the peculiarities of Giant powder are now pretty well known. By the suddenness and energy of its explosion it will produce effects in hard rock so much greater than ordinary powder that it has superseded the other almost everywhere. Moreover, since its shattering effects are not even dependent on its being placed in a confined space, it is available for purposes which an explosive requiring those conditions is not adapted. It is almost exempt from danger by fire, since it burns when lighted and explodes only by heavy and sharp shocks, such as are given by a percussion cap or hammer. For the blasting of soft materials, however, this suddenness of action and energy make it suitable even where its greater strength is reduced, as it is in the Giant powder "No. 2" and "No. 2 extra," made by the company for medium hard rock.

The Committee also state in reference to the new Judson powder made by the same company, that is another formidable rival to gunpowder. The product is made by a somewhat complex process, and contains only five per cent. of nitro-glycerine. The Judson powder, the Committee says, seems to combine in an eminent degree, the slower actions of gunpowder with the greater power and shattering effects of dynamite, making it a very useful explosive for soft materials while its price is the same as that of common blasting powder. This powder has recently been tried to great advantage on the Bantas branch of the Central Pacific railroad.

The Committee do not enter into the details of the methods by which the strength of each day's product is tested at the works. It may be briefly stated, however, that this is done by the compression, or shortening of a lead ingot on which the force of the explosive is tried, and is then carefully measured by means of callipers. The Committee saw these experiments, however, and give in their report the result of those tried in their presence as follows:

The first column of the table gives the distance to which a 30-pound ball was thrown from a mortar by a charge of 6.5 grammes of each kind of powder. The second column shows the reduction in length of an ingot of lead one inch high by equal charges of the powders in the testing machine. (The amount of reduction is given in thousandths of an inch.)

	Range of Ball.	Reduction in Length.—Inch.
	Feet.	
Giant Powder No. 1.....	653	0.798
Giant Powder No. 2, extra.....	591	0.623
Giant Powder No. 3.....	531	0.531
Judson Powder.....	350	0.416
Black Blasting Powder.....	47	0.200

In estimating the bearings of these results it must be remembered that as the testing apparatus is made for special use with quick-acting nitro-glycerine explosives, in which "windage" is of little consequence, the common black powder appears at a disadvantage that is due more to its mode of action than to its lack of strength. The short mortar used as well as the cast-iron projectile are frequently cracked by the Giant powder; while the shortness of the bore does not give the slow-acting powder time to bring its full force to bear. The Committee are of the opinion that the compression of the lead ingot affords a nearer approach to a fair comparison of maximum strength.

The Committee think that as the shattering effect of the Judson powder is, in the great majority of blasting operations, an unquestionable advantage, while it is as cheap as black powder, and the "liability to accident very much less," it seems likely that the Judson powder may prove as formidable a competitor to gunpowder in the blasting of soft materials as the Giant powder has been in the mining of hard rocks.

THE Silver Hill mining company are about to sink a new shaft at a point between 1,200 and 1,500 feet east of the present shaft. It will strike the ledge at a depth of about 2,000 feet.

WE have on hand an illustrated article from the pen of J. W. A. Wright, on the jumping bean or devil bean of Mexico, which will be published next week.

## HYDRAULIC MINING IN CALIFORNIA.\*

No. 8.

[By AUG. J. BOWIE, JR., A. B., Mining Engineer.]

## The Bowman Reservoir and Dams.

The Bowman dam, owing to its position, has been constructed by the North Bloomfield company with due reference to the possibilities of breaks occurring in the several other reservoirs east of it, and it is intended in any emergency to hold the drainage not only of its own watershed, but also in case of accident to withstand any rush of water from the reservoirs beyond it. It is the largest dam on the coast. The following detailed account of it was written for this paper by Mr. Hamilton Smith, Jr., C. E., who planned and constructed the dam.

This reservoir was designed for the supply of water during the dry season of the year for the Bloomfield hydraulic gravel mine, owned and operated by the North Bloomfield mining company.

It is located in a mountain valley, on the head waters of one of the branches of the Yuba river, in Nevada county, California, at an elevation of 5,400 feet above sea level.

It is fed from a gross catchment basin of 28.94 square miles. There are a number of other reservoirs owned by the Bloomfield and Eureka Lake companies on the same stream above the Bowman reservoir; the upper one of these is of large size, holding 630 million cubic feet of water. In ordinary seasons these upper reservoirs retain all the water flowing into them, hence the catchment basin of the Bowman is only about 22 square miles, except in years of large rainfall. The mean annual rain and snow fall at the Bowman dam has been 77.91 inches for the past five years, of which about 75 per cent. flows into the reservoir. Two dams are needed to impound the water. The main one, placed across the narrow gorge forming the outlet of the valley, has a maximum height of 100 feet (96½ feet above datum base line), and an extreme length on top of 425 feet. The smaller dam is placed across a gap near the mouth of the valley, has a maximum height of 54 feet and an extreme length on top of 210 feet. It is fitted with wasteways, and over it will be discharged all surplus water from the reservoir.

Ordinary high water mark will be fixed at a point four feet below the summit of the main dam, being coincident with the crest of the waste dam. At this height there will be impounded 845 million cubic feet of water, with a surface area of 502 acres. By placing temporary flush boards on the top of the waste dam, the water can be brought up to 95-foot line (above datum base), increasing the quantity of water stored to 920 million cubic feet.

The canyon or stream feeding the reservoir has a maximum flow during great freshets of from 5,000 to 7,000 cubic feet of water per second. The existence of other reservoirs higher up the stream adds to the danger from great floods, and therefore the Bowman dams have been designed to withstand not only the freshets in the canyon, but also any additional influx of water caused by breaking of upper dams.

## Description of Main Dam.

Sketch 1 shows a profile across the canyon, being a longitudinal section through the dam. Sketch 2 gives a cross section of the dam at its extreme height.

It rests on solid granite bedrock, which is sufficiently free from seams to prevent any considerable leakage through crevices in the rock.

The dam was built in the year 1872 to the height of 72 feet, as shown by sketches, being a timber crib formed of cedar and tamarac unhewn logs, firmly notched and bolted together, and solidly filled with loose stone of small size. A skin of pine planking spiked to the water face formed its water-tight lining. During the years 1875 and 1876 the dam was increased to the height of 96½ feet above datum line (100 feet extreme height) by filling in a stone embankment on the lower side of the old structure, faced with heavy walls of dry rubble stone of large size. The down stream face wall is 15 to 18 feet thick at the bottom, diminishing to six or eight feet at the top. Most of the face stone in this wall are of good size, weighing from three-fourths to four and one-half tons, and there are many stones of equal weight in the hacking. The lower portion of the wall is 17½ feet high, with a batter of 15 per cent. It is built of heavy stone with ranged horizontal beds and with the face stone tied to the backing with long iron clamps.

The upper portion of the wall is built with a slope of 45°, and the face stone is bedded on an angle of 22½°, thus dividing the angle between a horizontal bed and a bed at right angles to the face. No attempt at range work was made in this upper portion of the wall. Above the 68-foot line, ribs of flattened cedar eight inches thick are built into the up-stream face wall, and are tied to it by iron rods three-fourths inch diameter and five feet long. To these ribs a planked skin is firmly spiked. This planking is of heart sugar pine three inches

thick and eight inches wide, with planed edges fitted with an outgate similar to ship planking. The plank was put on nearly thoroughly seasoned, and swells sufficiently to make the face practically water-tight, without either battens over the joints or calking. The opening at the joints made by the outgate suck in small particles of vegetable matter, which take the place of calking to a great extent. At the bottom the plank is fitted closely to firm bedrock and calked with pine wedges. There will be three thicknesses of plank (nine inches in all) placed on the lower 25 feet, two thicknesses (six inches) on the next 35 feet, and one thickness on the upper 36 feet. From past experience it is believed that this planking will remain sufficiently sound 20 years at least, and then it can readily be replaced.

A culvert extends through the dam, as shown by sketch 2, through which the water is drawn from the reservoir. This culvert is built with heavy dry rubble foundation and

There are 55,000 cubic yards of material in the structure, weighing about 85,000 tons; the hydrostatic pressure, with the water line 95 feet above datum against a vertical plane of that height across the canyon at the dam site, will be 21,745 tons. The dam is V-shaped, with the vertex of the angle of 165° pointing up stream. This mode of construction adds somewhat to the stability.

The cost of the dam when completed\* will be \$132,000. The rather peculiar construction of this dam was due to the following causes: The stone cliffs in the vicinity of the dam are composed of an exceedingly hard granite with great numbers of short cross seams, thus making it most costly to quarry dimension stone of considerable size. The stone has rarely a good cleavage, and the cost of dressing it down to regular beds is hence great.

No limestone is to be found near by, and any lime used must needs have been transported to the work from a long distance. The cost of trans-

cessive cribs, are solidly filled with granite stones of various sizes, from several tons down to a few pounds. No sand or fine stone was used in this filling. A plank facing of three-inch heart sugar pine is spiked on the water face, making a water tight lining similar to that on the main dam. The crest of the dam is 92½ feet above datum line, being, as stated before, four feet lower than the summit of the main dam. In it are cut 28 waste ways, each four feet in width, and having a depth of seven feet below the crest. These wastes are closed when all danger from freshets is passed, with boards two inches thick, eight inches wide, four and one-half feet long, placed horizontally, and sliding to their places one above the other on the inclined slope of the water face. This style of gate, though the simplest form known, has been found by long experience to be the very best.

The weight of the dam is about 6,500 tons, and the hydrostatic pressure, with the water line at 95 feet above datum against a vertical plane of that height across its upper face, will be 2,571 tons.

It is believed that the structure is sufficiently stable to allow with safety a flood of 16,000 cubic feet of water per second to pass through the wastes and over its crest.

The water passing over the dam will fall on bare granite bedrock, and thence flows down a steep gorge. From past experience in the use of cedar timber, it is safe to assume that the life of this structure will be from 25 to 30 years, and possibly longer. Its cost has been \$15,000.

## Hydraulic Washing.

The tunnel or opening for the sluices having been completed, the sluices placed in position, lined, and rifles set, water is turned on in the pipes and work commences. The first work is started near the head of the sluice, and the mine opened from that point. As the banks are washed away, the bedrock cuts are driven towards the face of the work, and the sluices are advanced as required.

To cave the bank, one pipe is kept playing on the lower part of it, at an obtuse angle, cutting out the gravel, and a second stream of water is directed from another pipe on the opposite side, forming a cross-fire, which materially aids the undermining. Any surplus of water not used in the pipes is allowed to run over the banks. In well-regulated works all the water should be used through pipes, and none allowed to waste into the claim. When the dirt caves readily, one pipe should be employed to do the cutting, and the second pipe should be manipulated clearing away the debris caving.

In working a claim, the face of the bank should be kept square. Advantage should be taken of the corners when left, and under all circumstances avoid working into what is called a horse-shoe form. If the banks are kept square, more work can be accomplished in less time, at less expense, and with fewer accidents. On the other hand, where a cut is pushed rapidly ahead, and the work is not squared, the men at the pipes soon stand encircled by high banks; washing can no longer be prosecuted to advantage, and the lives of the miners are imperiled. The majority of accidents arising from caves have been caused by this style of work.

Where the banks are very high, to mine to advantage it is advisable to hydraulic the deposit in two benches. Banks over 150 feet in height are dangerous to work as a single bench.

At North Bloomfield and at Smartsville, they are working single benches 250 feet high. When a cave is coming, to avoid the sliding of the great detrital accumulations, the water should be turned away from the falling masses, and the dirt will not run any distance; but if it is allowed to remain on the bank, a rush of water and debris ensues, and the men at the pipe have frequently to run for their lives. Such occurrences, arising either from carelessness or accident, cause a loss of time, and frequently entail damage to the pipe and machines.

Caves, when practicable, are generally made towards evening, and the night shift runs them off. Locomotive reflectors or fires of pitchwood are used to illuminate the banks during the night. The introduction of the electric light may ultimately be found serviceable.

In well conducted claims the washing should be continuous, and no water allowed to run to waste. It is, therefore, requisite to have several faces or openings, so that the water can be used from time to time on them, whilst the cuts are being advanced and the sluices lengthened. These cuts or "ground sluices," are mere trenches made in the bedrock towards the face of the bank washed, for the purpose of collecting the water and material, conveying them to the sluices. As a protection against theft, the sluices of claims worked intermittently are run full of gravel before turning off the water.

The length of runs in gravel claims is dependent on circumstances. Some claims clean up every 20 days or month, others run two to three months, whilst some only clean up every season after the water supply has ceased. In point of economy, the fewer clean-ups the better.

JOHN TOME of Eureka, Nevada, has made a contract with some coal burners near Alpha, to burn and deliver 250,000 bushels of coal during the next four months. He also purchased some valuable wood ranches upon which he intends to work 100 men this winter.

FIG. 1. SECTION ACROSS CANYON THROUGH MAIN BOWMAN DAM.

walls, and is covered with granite slabs, 16 to 18 inches thick and six and a third feet long. Three wrought iron pipes of No. 12 iron, each 18 inches in diameter, pass through the water face of the dam, as shown by sketch 2. Their upper mouths are protected by a strainer formed of two-inch plank, anchored to the bedrock. A separate valve or gate is placed at the lower end of each pipe; the water passing through the gates, aggregating a flow of 280 cubic feet per second when the three are open, discharges into a covered timber sluice seven

port would have been so great as to render the use of lime impracticable.

On the side of the mountain, at the distance of about one mile from the dam, there was a large pile of loose stone, the result of centuries of disintegration of the cliffs above. This stone was too irregular in shape to be used in wall building, but of good quality for an embankment. It was much cheaper to build a tramway to this stone already quarried by nature, load it on cars, and haul it to the work than to quarry a smaller quantity from the cliffs nearer the dam.

FIG. 2. SECTION THROUGH MAIN DAM AT DEEPEST POINT.

and one-half feet wide, one and three-fourths feet high, passing to the lower edge of the dam, and discharges on the solid bed-rock of the creek bed. The gates are approached by a man-way above the sluice. The crest of the dam will be formed by a coping of hewn heart cedar timbers 18 inches wide on top, and anchored securely by iron bolts to the stone wall below.

It is not probable that any water will ever pass over the crest of the main dam, but should a break occur at the large reservoir higher up the stream when the waste gates at the waste dam are closed, the difference in level between

FIG. 3. Section across Ravine through Waste Dam.

the crest of the main and the waste dams might be insufficient to allow the resulting flood to pass over the waste dam. Additional care was, therefore, taken in building the down-stream face wall of the main dam, so that it can in any such possible emergency resist without injury a large stream of water passing over the crest. Should this happen a large quantity of water would enter the structure, owing to the inclined beds of the face stone and the flat slope of the wall, which would seek its discharge through the interstices purposely left in the nearly vertical portion of the lower wall. To prevent the consequent hydrostatic pressure, which would accumulate at the base of the dam to perhaps 20 pounds to the square inch, from forcing out the lower face of the wall, it was carefully built and tied with iron rods, as before described.

Hence, the supply of material being abundant, the flat slopes of 45° for the wall were adopted, which allowed with safety very much lighter face walls to be used than would have been the case had they been more vertical.

The stone for the wall as built was quarried from solid rock and cost in place per cubic yard three or four times more than the loose stone brought from the mountain side. When in the future the timber logs forming the cribs in the original

FIG. 4. Section through Waste Dam.

72-foot dam decay, there will be some slight subsidence of superincumbent stone. The depth of the stone is so considerable and the slopes of the walls so flat that it is believed this subsidence will not be noticeable.

## Description of the Waste Dam.

Sketches 3 and 4 show longitudinal and cross sections of the dam. It is a crib of round cedar timbers, varying from 12 to 30 inches in diameter, notched down to heart wood at the joints, and firmly bolted with three-quarter and one inch long drift bolts, with the foundation logs fastened to the bedrock with one-and-a-half-inch iron dowels. The crib, or rather the auc-

\* Up to December 31st, 1876, \$126,000 had been expended on its construction, and the remaining \$6,000 necessary to complete the work will be expended during the year 1877.

\* A paper read before the American Institute of Mining Engineers of the Wilkes-Barre meeting, May, 1877.

† The main dam was not quite finished in 1876, to being deemed advisable to allow a large stream of water 50 to 75 cubic feet per second, to flow over the present summit of the stone at 85 feet above datum, and to percolate through the stone embankment, in which some sand and finely mixed stone are mixed. This will finally settle the structure, and then the top courses for the crest will be put in place.

## DEWEY &amp; CO.

## American &amp; Foreign Patent Agents

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

## Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

## Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

## Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

## Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## DEWEY &amp; CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 202 Sansome St., N. E. corner Pine, S. F.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY &amp; CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL, MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

## Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance Sample copies, post paid, 10 cents.

DEWEY &amp; CO., Publishers, S. F.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly. The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding. It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from this office for 50 cents, postpaid. Wholesale and retail agents wanted.

Any person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinued.

## San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tanned Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS &amp; CO.,

611 and 613 Front Street, San Francisco

## PACIFIC BUSINESS COLLEGE, 320 POST STREET, Opposite Union Square, San Francisco.

This institution imparts a first-class Commercial Education, a practical knowledge of Telegraphy, and thorough instruction in the English and Mathematical branches, Penmanship and the Modern Languages. It has ever been a cardinal principle in the management of the College to provide thorough and practical courses of study. Every available modern improvement has been introduced, and whatever energy and liberal expenditure of money could do, has been done to place the institution at the head of similar schools.

## LIFE SCHOLARSHIPS

For a complete Business Course are issued at the low rate of \$70. This is the only Business College in the State that employs this liberal system of tuition fees. Day and evening sessions during the entire year. Ladies are admitted into all the departments. Each student receives separate instruction. The discipline at the school is excellent. Graduates at the Pacific Business College find little difficulty in obtaining good situations, being preferred by our business men to the graduates of any similar institution. Those who desire to prepare themselves for the practical duties of life, at the least expense of time and money, should examine the merits of this school before attending elsewhere. Send for circulars.

We have the best Imitation Gold Watch in the Market for Trading Purposes. The metal is a composition of other metals, so closely resembles real gold that the best judges find it difficult to detect the difference, except by a chemical test, and it has the virtues requisite to make it the best substitute for gold. It is known as GENUINE AMERICAN MOVEMENT, EXPANSION BALANCE, BEAUTIFULLY ENGRAVED OR ENGINE TURNED HUNTING CASES, and equal in appearance to a GOLD WATCH THAT COSTS from \$150 to \$200. It sells and trades readily, for from \$30 to \$100, and if you wish a watch for your own use or to make money on, try this. Owing to our large sales, we are enabled to reduce the price of them to \$12 each with an elegant Chain attached. They are used on Railroads, Steamers, and in Manufactories, and other places where accurate time is required, and gives general satisfaction. We send them by Mail or Express, on receipt of \$12, to any part of the Country, or it will be sent C.O.D. when the customer desires and remits \$2 on account. These elegant CHAINS weigh about Fifty Pennyweights, and the same pattern in pure gold would cost \$100. We sell these Chains at \$3 each. But we sell the Watch and Chain for \$12, sent by Mail in a Registered Package, post-paid, to any Post Office in the United States.

WE SELL THE WATCH WITHOUT THE CHAIN FOR \$10.

## PATENTS AND INVENTIONS.

### List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING NOVEMBER 13TH.

SASH HOLDER.—Ives Scoville, Oakland, Cal.  
SEWER TRAP.—John H. Mackie, Oakland, Cal.  
WHEEL CULTIVATOR.—Irvin Macy and John C. Watkins, Harrisburg, Oregon.

SECTIONAL CHIMNEY.—Leonard E. Clawson, S. F.  
LEATHER SPLITTING MACHINE.—Horatio N. Cook, S. F.  
DEVICE FOR PERFORATING ARTESIAN WELL TUBES.—John M. Greal, Los Angeles, Cal.  
TINNER'S MACHINE STAND.—W. Dale, San Lorenzo, Cal.  
HORSE HAY FORK.—Byron Jackson, Woodland, Cal.  
AMALGAMATING PAN.—Guido Kustel and Ottokar Hofmann, S. F.  
GANG PLOW.—Charles Lowrey, Stockton, Cal.

#### TRADE MARKS.

SALT.—Balfour, Guthrie & Co., S. F.  
MANUFACTURED WIRE IN THE COIL.—A. S. Hallidie, S. F.  
—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

**DREDGING APPARATUS.**—Ezra F. Dennison, S. F. This improved dredging machine is especially intended for raising mud from the bottom of a river, lake or bay, and conducting it to a distance from the dredging machine for the purpose of depositing it either upon land or in water. It is more especially intended as a levee building machine. It takes the mud and heavy material which forms the bottoms of bays and water courses, and deposits it in a line along the bank, so as to form a levee or embankment for reclamation purposes. The invention consists in the employment of one or more steam vacuum pumps, located on a suitable platform or vessel, and connected with a pressure or reservoir tank, into which the material is delivered by the pumps. A flexible floating pipe of peculiar construction connects the pressure or reservoir tanks with the place where the material is to be delivered, and serves to conduct the material away from the tank to any desirable point. It also consists in a peculiar method of operating the valves, which alternately deliver steam and water to the vacuum cylinders.

**SHAFT COUPLING.**—Napoleon Beauregard, S. F. The first part of this invention relates to an improved clutch for connecting and disconnecting the meeting ends of line shafting. The improvement consists in providing an arrangement in connection with an ordinary interlocking clutch, by which the parts of the clutch can be automatically thrown out of gear and the two shafts disconnected while the shafting is in motion and under strain. The second part of the invention relates to a novel bearing for supporting the end of the line shaft upon which the shifting clutch is placed. The principal use for which these inventions are intended is in connection with the line shafting of rolling mills, but they can also be applied wherever it is desirable. The arrangement is claimed to be quite simple and effective.

**SKEWER PULLER.**—Will & Finck, S. F. The appliance patented by this firm is an implement for withdrawing skewers from cooked meats and replacing them after a portion of the meat has been cut off. The operation of pulling the skewers out of a cooked roast is quite simple and can be performed with any ordinary implement, but in order to preserve the roast in a slightly and presentable form the skewers must be replaced after a portion of the meat has been cut away. This implement, however, is intended both for pulling the skewer and inserting it into the cooked roast. It forms an additional implement for a set of carvers and provides the means for keeping a roast in a slightly condition until it is entirely cut up.

**EXCAVATING MACHINE.**—J. H. McMurphy, Merced, Merced county, and E. W. Chapman, S. F. This invention relates to that class of ditching and excavating machines in which a plow is arranged to turn the earth into an elevator which is formed on the periphery of the large wheel, so that the rotation of the wheel will lift the earth and deposit it either in a box or upon an endless belt or draper. The improvements consist in a peculiar construction of the elevating wheel and in the arrangement of the different parts of the machine. With the improved machine they can raise earth and convey it to a distance with facility, and it will be specially useful for making ditches and canals where the earth excavated is to be used for forming an embankment.

**WINDMILL.**—A. M. Abbott, Stockton. This improvement in windmills consists in a means for producing a direct vertical motion of the rod or pitman, which extends from the crank

through the turn-table of the mill, so that there will be no motion of the rod from side to side. This enables the inventor to employ a novel construction for the turn-table, which is of very small size, so that the wheel can be placed close to it, and near its vertical axis of revolution. The invention further consists in a cheap, strong and novel construction for the frame of the mill.

**PRIZE MEDAL OIL.**—(Trade Mark.) A. C. Deitz & Co. This trade mark consists of the words, "Prize Medal Oil" arranged above and below the figures "1876." The essential feature of the trade mark is the words "prize medal." The firm has used it on vessels, cans or cases containing kerosene oil.

### A Plea for the Sinews.

It is drawing near this close of the year. An unusually large amount of money stands due us from subscribers. We need this money for present use in the carrying on of our business. We are hating as vigorously as ever in the struggle to publish a journal which shall be unsurpassed in its truth, enterprise and usefulness—but to carry on the war we must have the sinews already pledged to us.

There are several reasons why we make the appeal. First, there are some subscribers who are absolutely unable to pay, because they have produced nothing this year. This load, which circumstances force us to carry, should be recognized by all those who can just as well pay us as not, but who either forget or neglect to help us with their dues. Every such one ought not to pass a day without forwarding to us the trifles which each owes, but which, in the aggregate, comprise just the resources which should be available to us at this time. We hope this kindly but will call out action from those who are in our debt, and that we shall speedily receive payments which will not impoverish them, but make us rich indeed in ability to meet the growing requirements upon us.

We have not suffered our journal to show any signs of a "dry year," because we put faith in those whose subscriptions we had. We do not believe in backward steps in journalism. We began the year with a large expenditure for new type, the benefit of which all readers have enjoyed. We were forced by circumstances to incur the expense of removing our publication offices. We have undertaken outlay in the increase of our engraving facilities, the advantage of which will appear clearly in the future. We have expended more money in many ways necessary to the improvement and increased usefulness of our paper. These forward steps we do not regret; they are necessary to our progress. But the taking of them throws an obligation upon those who are profited by our work, to stand abreast of us in our efforts and help us with what is rightly ours, and which we greatly need.

It is hardly necessary for us to allude to the claims which the MINING AND SCIENTIFIC PRESS has upon the mining community and industrial classes on this coast. We believe honestly that the paper has done a great deal to advance the mining interests on this side of the continent, and in so doing has enhanced the value of mining property by bringing it before the people. We have endeavored and shall continue to endeavor to give to our readers every item of interest possible which will aid them in their business and at the same time show to the public what is being done from week to week in the interests we represent.

This being the case, there is no reason why our friends should forget us when we never cease to remember them. Our readers must surely desire to help a paper of which they approve and which helps them, so they should not delay to forward us what is our due.

**PERSONAL.**—The Cincinnati *Enquirer*, alluding to Miss Anna Dickinson and her illness, says the following good words: "It is not strange. That powerful feminine brain has been ceaselessly active from her girlhood. Since, as a slight Philadelphia girl, she paid her first quarter of a dollar to hear Wendell Phillips lecture, she has lived a life wedded fast to the intellect. The most eloquent female platform speaker among women—novelist, dramatist and actress, as well—her rare versatile faculties have been constantly overworked. No woman of this generation has accomplished so much, or has ventured upon such varied fields with such success. This illness may prove a blessing in being a warning. She has added something to every art she has touched and she has touched the highest. Everybody hopes that her present illness will not interfere with her engagements for this winter to entertain the public."

A MEETING will be held on the 19th of December to choose one or more assignees of the estate of the Pioneer Savings and Loan Bank. In the meantime creditors will appear before Register Gitchell to prove up their claims.

GEN. SHERMAN has testified before the House Military Committee that the present military force on the border is insufficient to protect the lives and property of citizens, and recommends its increase.

THE Central Pacific railroad company is paying its taxes. At Reno it paid \$13,264.93 to Washoe county; at Winnemucca it paid \$35,760.40 to Humboldt county.

### News in Brief.

GENERAL GRANT will go from Athens to Alexandria and Cairo.

THERE is great mortality from typhoid fever in the vicinity of Watsonville.

THE schooners *Albert* and *Edward* was lost on the Mendocino coast, this week.

ONE of the notorious Davenport brothers, slight-of-hand performers, is dead.

AN attempt to break out of the Los Angeles jail was frustrated on Monday night.

THE "New England Club of the Pacific Coast" has been organized in this city.

THEY had several successive earthquake shocks in Mendocino and Humboldt counties this week.

A BRITISH man-of-war is to be stationed at the Hawaiian Islands, to look after British interests.

MRS. GEO. H. THOMPSON, sister of Senator Sargent, of California has committed suicide at Lowell, Mass.

MR. STEPHEN FIELD, the electrician, returned from a trip to Europe and the Eastern States last Saturday evening.

WM. SMITH, of the well known hanking firm of Rideout & Smith, Marysville, has disposed of his interest to his partner.

THE New York *Tribune* says the Silver bill has no prospect of reaching the President during the present session of Congress.

THE *City of Peking* brought as a part of her cargo the enormous consignment of 100 tons of silk-worm eggs for Italy from Hongkong.

MR. MILTON S. LATHAM, of the London and San Francisco Bank, is still confined to his bed. The utmost care is taken, as his disease is a dangerous one.

THE United States Grand Jury in this city has concluded its labors. The number of indictments found is 34, most of them for cutting timber on Government land and defrauding the revenue.

THE United States steamer *Lackawanna* will leave in the early part of the next month for the southern coast for the purpose of surveying the reef upon which the *City of San Francisco* was wrecked.

THE Mexican war steamer *Mexico*, now in San Diego bay may come to this port, her commander having telegraphed to his superiors for permission to do so that the vessel may go into a dry dock for repairs.

SAMUEL G. PIERCE, who died in Oakland last week, was the author of the Constitution of California, and a veteran of the Mexican war. He served in company F, 47th artillery, under General (then Colonel) Sherman.

LATE news from Chile represents Paraff, of oleomargarine fame, to be incarcerated in prison at Santiago, owing to his "reactivo" swindle. His assistant has shared the same fate. The latter is represented to have been at one time doing business in this city as a jeweler.

It is reported that the Sultan, sorely pressed and finding no decided and reliable friend in any of the European nations, but having, alone and unaided, to meet the hosts of Russia, thus without funds, and friends has determined to enter upon negotiations for peace directly with the Czar.

A SPECIAL from Matamoras, Mexico, says the troops which left the City of Mexico some days ago under command of Trevino, for the Rio Grande, are not to repel the United States troops, but to co-operate with the United States authorities in maintaining peace between the two countries.

THE fishermen of Collinsville are about to organize a Fishermen's Association, and send delegates to confer with the Fish Commissioners to fix the time for the spawning and protection of the fish in the bays and rivers of our State satisfactorily to all concerned, and then to pledge themselves to live up to the law and protect the fish at all hazards.

LAST Friday afternoon a letter was received in this city, addressed to the wife of Nelson H. Mowry, the champion long-distance rider and leader of the California Polo Club, announcing that Mowry died at New Orleans on the 7th inst. of yellow fever, after a few day's illness. "Nell," as he was familiarly called, was a splendid specimen of manhood, and at the time of his death was 37 years of age.

MESSRS. Pond, Leveridge & Brown are about to build a large and extensive fish cannery at Collinsville, on the Sacramento river. The main building is to be 150x50 feet, with a wing 60x40 feet for a bath and engine room, and is to contain all the modern improvements known in the salmon canning business. The firm have already made all their arrangements and contracted for their fish for the coming season.

A cablegram gives an account of the reception given by Mrs. John W. Mackey to General Grant at the Mackey villa in Paris. The residence and furniture, which cost 2,000,000 francs or \$400,000, is said to be one of the best appointed houses in the French capital, and the private receptions of Mr. and Mrs. Mackey during the past year have not only been largely attended by Americans, but also by leading Europeans. Mr. Mackey, who is at present in this city, will return to Paris in about a month.

THE Indians are raiding the ranches in the Black Hills.

THE Winnemucca water works have been completed.

THE citizens of Berkeley, are again discussing the advisability of consolidating with Oakland.

THE Public Schools of Nevada city are crowded to their utmost capacity. More school room is required.

THE New York *World's* Washington special says that Russell Hastings, of Cleveland, Ohio, will succeed McCormick as Assistant Secretary of the Treasury.

THE Legislature will be called upon this session to restrict the fare on street cars in this city of five cents, instead of six and one-fourth cents as at present.

A FEARFUL gale raged around the British Isles on Saturday night. Thirty vessels are ashore between Ramsgate and Deal, and many lives are reported lost.

REV. HUGH SMITH CARPENTER, formerly of San Francisco, who has lately taken charge of the Bedford Congregational church, Brooklyn, preached on Sunday and is well spoken of.

RECENT reports said to be in circulation in San Francisco to the effect that sickness prevails in Santa Barbara, are erroneous. No epidemic prevails, and the place is clean and healthy.

THE revenue steamer *Shubrick* has placed in position in 20 fathoms of water outside the heads one of Courtney's automatic buoys. In ordinary weather these buoys can be heard three miles off.

THE Government of Colombia has made a contract with an Englishman named Ross for the construction of the Central railroad for \$20,000,000. Panama subscribers \$250,000 per annum as a subsidy, it is reported.

An order has been issued calling out 150,000 of the civic guards in Constantinople and provinces, to maintain order during the possible absence of the regular forces. Christians are summoned to participate in this levy.

DISPATCHES from New York, state that it is painfully evident that the trade and industry of the country await the possibility of financial disturbance by Congressional legislation, enough to cause great stagnation.

TRICKETT, the Australian champion oarsman, having challenged the world to a three-mile race for £1,000, to be rowed in any country, Courtney accepts, to row in the United States, for this amount or more, and will pay Trickett's expenses to this country in the event of Trickett's defeat.

LAST fall two Oneida Indians voted at Oneida, New York, and were arrested on the charge of illegal voting. It was claimed that Indians had no right to vote, and the two Oneidas were indicted and tried before Judge Wallace, at Utica. The Judge decided that the Oneidas are entitled to vote, and at the November election a number of them did vote.

THE Ambassador of the Samoan government, M. K. Lamamen, with his associate, James Guthrie, arrived in Washington, Monday, and will have a conference with the Secretary of State. The object of the Ambassador is to negotiate with the United States a treaty of friendship and commerce, thus securing recognition as an independent nation.

AT Stillwater, the headquarters of the Piute Indians, in Nevada a strange disease has broken out among the Indians. A large number of them at that place are effected with a swelling of the toes and fingers, which besides being very painful renders them utterly helpless. The disease seems to be epidemic amongst the Indians.

THE *Soleil* says: Another dissolution, if voted by the Senate, would complicate instead of solving the crisis. The *Republic Francis* demands the withdrawal of the new Cabinet and renews its argument in favor of the Congress of the two houses to definitely settle open constitutional questions. Several conservative papers say that the Government will call upon the Senate to declare openly for or against it.

THE refrigerator slaughter house at Winnemucca station has commenced dressing beef for shipment. This enterprise bids fair to result in great benefits to the community at large, as well as to stock raisers. Its success will make Winnemucca the great meat shipping station for central and northern Nevada, eastern Oregon and western Idaho. It will make a home market for beef cattle and sheep; it will be of immense advantage to the owners of hay ranches along the Humboldt.

A NUMBER of cypher telegrams have recently passed between Senators Jones and Sharon on the subject of the present crisis in the Senate—Jones endeavoring to impress Sharon with the importance of leaving his business long enough to help his party out of the existing emergency. A dispatch has now been received from Sharon, saying that it is absolutely impossible for him to leave before December 20th, at the earliest. In reply to a representation of ill-feeling against him on the part of Republican Senators on account of his absence, he states that if any considerable number of his associates desire it, he will resign in time to have his successor chosen by the new Legislature of this winter.

Women as Mine Locators.

This following decision of the Commissioner of the General Land Office, published in the Eureka Republican, holds that women have equal rights with men in the location and holding of mining claims:

WASHINGTON, Nov. 13th, 1877.

Register and Receiver, Eureka, Nevada:

GENTLEMEN:—Referring to your letter of the 14th of September last, I have to state that Section 2319 of the Revised Statutes of the United States declare that the mineral lands of the United States shall be free and open to exploration and purchase "by citizens of the United States, and those who have declared their intention to become such, under regulations prescribed by law." The law makes no distinction in this regard on account of sex.

Mining claims may be located and held by either males or females upon compliance with law. Very respectfully, your obedient servant, J. A. WILLIAMSON, Commissioner.

This decision is perfectly just. We see no reason why a woman cannot claim and run a mine as well as a man. A good many women have been found to manage farms as well as the men have, and in some cases much better. On the farm, in fact, the burden of the home economy rests on the woman's shoulders, and it depends greatly on her whether there is a balance or a deficit at the end of this year's work. The women, however, have not had much opportunity to try their hands at managing mines, but seeing that men make so many failures in proportion to successes, perhaps an infusion of female economy into the business might be beneficial.

During the quicksilver excitement of a year or two ago in the coast counties of this State lots of farmers left the plow and took up the pick and shovel, roaming over the hills in search of cinnabar. These claims were found on the farming and woodlands where women could travel as well as men, and a good many claims were discovered by the gentler sex. Perhaps if quicksilver had kept up to an encouraging price we should have heard before this of several female mining superintendents, running their own property. There is no reason as far as we can see, why there should not be "bonanza queens" as well as "bonanza kings," and we hope to see a few one of these days.

HYDRAULIC MINING.—This article on this subject from the pen of the well-known engineer, Aug. J. Bowie, Jr., which is now being published in the PRESS, is an especially valuable one, and our hydraulic mining friends will find it alone worth more than a year's subscription to this PRESS. The facts and figures given by Mr. Bowie are of great value as showing the results of practical work. A reliable article of this kind is more profitable for miners to read and study than any other class of literature. We advise those who do not usually file away the PRESS to commence keeping their numbers now and they will have this standard article as a whole. It has been carefully revised and corrected by Mr. Bowie and comprises the whole literature of hydraulic mining in California.

THERE are 550 infants in the great National Baby Show, opened at New York Monday morning. Grand pianos make inaudible this melody of the babies.

THE Chief Signal Officer of the Army, in his annual report, recommends legislation for a more complete organization of the Signal Service.

TO QUERISTS.

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, all free to parties who address this office on matters of more interest to themselves than to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

P. S.—Persons receiving this notice by letter will please take it kindly (under the fifth rib), and be sure to STAMP us—(but not too hard)—by return mail.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

A VALUABLE MINING BOOK.

BY J. S. PHILLIPS.

The Explorers', Miners' and Metallurgists' Companion, 682 pages, 83 Illustrations. Second Edition. A California publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—London Mining Journal.

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—Mining and Scientific Press, San Francisco.

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—S. F. Golden Era.

He has rendered to the leading industry of the coast a valuable service—has furnished the millman and miner a safe and much needed practical guide.—Overland Monthly.

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—S. F. Commercial Herald.

This book is free from trash and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—S. F. Daily Alta.

In the several sections the work is eminently practical. It is very comprehensive and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—S. F. Daily Examiner.

It affords a vast quantity of information as to the appearance and value of different ores.—S. F. News Letter.

It is the best single English treatise we know for the use of prospectors and practical miners.—The Engineering and Mining Journal, New York.

Sold by Dewey & Co., at this office. Price \$10.50.

Testing and Working Silver Ores.

This above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ore for Silver," we find paragraphs on ore formation test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working same, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patehen's process, etc. He also describes the method of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroehnke's process, etc. Under "Pulverizing Machines" are described the astrata and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noise's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tallies and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners and prospectors to use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 202 Sansone Street, San Francisco.

UNITED STATES

Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Register's Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 60 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of this MINING AND SCIENTIFIC PRESS, S. F.

Newspaper Filsholders.

Dewey's new elastic fileholders (black walnut), size of the PRESS, Harper's Weekly and Scientific American, for 50 cents. Larger sizes to suit any newspaper, 75 cents. By mail, postpaid, 10 cents extra. Cash with all orders. Patent allowed. Address, Dewey & Co., Publishers, San Francisco.

To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where he principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend this publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Advance Silver Mining Company.—

Location of principal place of business, San Francisco, California. Location of works, Monitor District, Alpine County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the twenty-first day of November, A. D. 1877, an assessment of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 16, No. 309 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the second day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the twenty-sixth day of January, 1878, at 2 P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

B. LINGLEY, Sec'y.

Office, Room 16, No. 309 California St., San Francisco, Cal.

California and Oregon Land Company.—

Location of principal place of business, San Francisco, Cal. Location of works, Jackson County, Oregon.

Notice.—There is delinquent upon the following described stock, on account of assessment No. 1, levied on the seventeenth day of October, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Am't.
Allen, J. O., Administrator Estate of	98	600	\$175 00
Belcher, W. C.....	48	500	175 00
Belcher, W. C.....	49	600	175 00
Belcher, W. C.....	60	500	175 00
Clark, J. W., Trustee.....	125	1000	350 00

And in accordance with law, and an order of the Board of Directors, made on the seventh day of October, 1877, so many shares of each parcel of such stock may be necessary, will be sold at public auction, at the office of the company, Room 2, No. 417 California Street, San Francisco, California, on Monday the twenty-fourth day of December, 1877, at the hour of two o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. CLARK, Sec'y.

Excelsior Silver Mining Company.—

Principal place of business, San Francisco, Cal. Location of works, Potosi District, Lincoln County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the second day of November, 1877, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold and silver coin, to the Secretary, at the office of the company, 312 Post Street.

Any stock upon which this assessment shall remain unpaid on the third day of December, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on the seventh day of December, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. A. KOLLMYER, Sec'y.

Office, 312 Post Street San Francisco, Cal.

Merced Mining and Water Company.—

Location of principal place of business, San Francisco, California. Location of works, Quartzburg Mining District, Mormon Bar, Mariposa County, California.

## Iron and Machine Works.

THOS. PENDERGAST. HENRY S. SMITH

**ÆTNA IRON WORKS,**

MANUFACTURERS OF

**IRON CASTINGS**

and **MACHINERY**

OF ALL KINDS.

mont Street, Bet. Howard and Folsom

**SAN FRANCISCO.**

### SHEET IRON PIPE.

#### Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

#### • PHELPS MANUFACTURING COMPANY.

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

**ALL STYLES OF FANCY HEAD BOLTS.**

HOT AND COLD PRESSED HEXAGONAL AND SQUARE NUTS, WASHERS, BOLT ENDS, TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,

SAN FRANCISCO, CAL.

#### SACRAMENTO BOILER WORKS,

37 Fremont St., cor. Mission, S. F.

**HALL & KELSHAW,**

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Girders, Bridges and Iron Ship Building.

**ALL KINDS OF SHEET IRON WORK.**

Repairing promptly attended to at the lowest possible terms.

#### GOLDEN STATE & MINERS' IRON WORKS.

Manufacture Iron Castings and Machinery of all Kinds at Greatly Reduced Rates.

STEVENSON'S PATENT

Mold-Board **AMALGAMATORS,**

Golden State Pressure Blow rs.

First St., between Howard & Folsom, S. F.

#### UNION IRON WORKS, SACRAMENTO CAL. ROOT, NELSON & CO.,

MANUFACTURERS OF

**STEAM ENGINES, BOILERS AND ALL**

Kinds of Machinery for Mining Purposes.

Flouring Mills, Saw Mills and Quartz Mills Machinery constructed, fitted up and repaired.

Front Street, Between N and O Streets,

SACRAMENTO, CAL.

**California Machine Works,**

119 BEALE STREET, SAN FRANCISCO.

**BIRCH, ARGALL & CO.,**

Builders of QUARTZ, SAW AND FLOUR MILLS.

Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORES.

And General Machinists.

**McAFEE, SPIERS & CO.,**

**BOILER MAKERS AND**

**GENERAL MACHINISTS,**

Howard between Fremont and Beale Sts., San Francisco.

#### STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

**IMPROVED PORTABLE**

**Hoisting Engines,**

For Mining and Other Purposes.

Steam Engines and all Kin's of Mill and Mining Machinery

## Phoenix Iron Works,

NOS. 18 & 20 FREMONT STREET, NEAR MARKET,

JONA. KITTREDGE, - - - - PROPRIETOR.

MANUFACTURER OF

Fire and Burglar Proof Safes, Vault Doors, Bank Vaults and Bank Locks, Iron Doors and Shutters, Wrought Iron Girders, Prison Cells, Iron Fence, Guard and Cemetery Railings.

AND ALL KINDS OF

**HOUSE, SMITH AND BRIDGE WORK.**

**FORGING and MACHINE WORK in all its BRANCHES.**

SEND FOR CIRCULAR AND PRICE LIST.

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

**RANKIN, BRAYTON & CO.,**

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERS, ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster Rock Drills and Air Compressors heeler's Ore Breaker, Etc.

**GEO. W. FOGG, Supt.**

#### THOMPSON BROTHERS, EUREKA FOUNDRY,

Light and Heavy Castings of Every Description Manufactured.

Sole Proprietors and Manufacturers of

**Lynch's Ventilating and Illuminating Tile,**

The Only Illuminating Tile Manufactured for Lighting Cellars, Basements and Dark Rooms which provides proper ventilation for such places

129 and 131 Beale Street,

BET. MISSION & HOWARD, SAN FRANCISCO

#### CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minn

SAN FRANCISCO, CAL.

All kinds Brass, Composition, Zinc, and Babbitt Metal Casting, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.

J. H. WEED. V. KINGWELL.

### Machinery.

#### Machinery. BERRY & PLACE,

IMPORTERS AND MANUFACTURERS' AGENTS OF

#### Machinery & Supplies

Mining Engines, Saw Mills, Steam Pumps, Portable and Stationary Engines, Machinists' Tools, Air Compressors and Rock Drills, Wood and Iron Working Machinery, Pressure Blowers, Turbine Water Wheels, Gardner's Governors, Hydraulic Jacks, Leather and Rubber Belting, Emery Grinders and Wheels, Hose, Felt, Packing, Oilers, and Mill and Mining Supplies. Selling Agents in Pacific States for the Roadley Portable, and d'Erville's Vertical and Stationary Engines, and Cook, Rymes & Co.'s Celebrated Hoisting Engines.

Treadwell's Old Stand, Market Street,

Head of Front, San Francisco.

#### BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER.

**J. C. Senderling, Sole Ag't Pacific Coast**

51 Fremont Street, S. F.

#### SNYDER'S LITTLE GIANT STEAM ENGINE.

For Farmers, Machinists, Printers and all requiring light power. Sizes from one to six horse-power. Prices for engine and boiler complete, from \$150 to \$450. We make the strongest boiler and the best engine in the country. Call at our factory or send for free illustrated and descriptive catalogue.

SNYDER BROS., 94 Fulton Street, N. Y.

(Room 10.)

Attention, Mining Companies.

#### RICKARD'S PATENT Oxidizing and Chloridizing FURNACE,

FOR ROASTING

#### COPPER, SILVER & OTHER ORES

Prior to Leaching or Amalgamation.

The most striking advantages which it offers above all other recent inventions of this nature may be briefly summed up as follows:

First.—Its cheapness, the cost of its erection (ex-royalty and freight) not exceeding \$1,500, for a capacity to roast and chloridize twenty tons per day, viz: brick work, \$1,000, and iron work, including blower, \$500.

Second.—Short time required for erection, viz: 14 days, after providing all materials, with a sufficiency of labor.

Third.—No expensive, heavy or complicated machinery being necessary, involving heavy freight to the district where it may be required. Brick and clay generally obtainable on the spot, being the chief materials required in its construction.

Fourth.—No skilled labor or technical experience is necessary to work it. Two ordinary laborers being sufficient to attend to it when in full operation.

Fifth.—It does not easily get out of order, and is readily repaired by an ordinary mason or blacksmith when it does.

Sixth.—The royalty, or license to use it, is exceedingly moderate, removing thereby all temptation to evade or infringe the patent.

Seventh.—Calculating labor at \$3 per day, and wood at \$6 per cord, the cost of roasting is but little over \$1.50 per ton (ex-salt when chloridized), at these high California rates for labor and fuel.

One of them is now in the course of erection by the Aztec Gold and Silver Mining Company, at their mill in the Aztec District, Santa Rita mountains, Southern Arizona. At their office, 302 Montgomery Street, rooms 14 and 15, a model may be seen, and working drawings, with all further information necessary to enable any ordinary mason to construct the furnace, may be obtained from

**COL. J. D. GRAHAM.**

Pamphlets, with illustrations and full description, sent on application.

#### THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

**Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:**

One man.....	\$ 4 00
One mail.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 24 cents.....	40 00

Cost of 20 tons.....	\$52 25
Cost of one ton.....	2 61 1/2

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in Feavine District, Nev., and at the Exchequer mill, Alpine Co., Cal. For further information, apply to

**D. J. O'HARRA,**

Reno, Nevada.

#### TIRRILL'S UNDERGROUND METRE.

## GAS MACHINES

If you are examining Gas Machines it will be a great mistake not to send for the circular of the simplest and most effective Gas Machine ever invented.

METRE GAS MACHINE, 39 Dey St., N. Y.

### Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the **HAMPDEN WATCH COMPANY**, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

25 ELEGANT CARDS, no two alike, with name, 10 cents, post paid. **J. B. HUSTED,** Nassau, N. Y.

## GREAT ENTERPRISE!

—THE—

## Sierra Flume &amp; Lumber Co.

Have over 100,000 Acres of

SUGAR PINE, YELLOW PINE, SPRUCE,

Fir and Cedar Lands,

10 Saw Mills, 3 Planing Mills, 1 Sash and Door Factory,

149 Miles V Flume,

10 Miles Tramway,

157 Miles Telegraph Line,

13 Telegraph Stations,

Employ 475 Men and 550 Oxen &amp; Horses.

The Sugar Pine is unsurpassed in quality, and the whole Coast can be supplied.

The Yellow Pine is firm, fine grained and superior to any other hard Pine for Flooring, Stepping, etc. The Spruce has great strength, durable when exposed, and especially adapted to Bridge and Ship Building, while the Fir and Cedar are as valuable for a great variety of purposes.

Last year thirty millions of feet were cut and the estimate for 1877 is fifty millions; fifteen millions are now on hand, thoroughly seasoned by the hot climate of Red Bluff and Chico.

Large orders can be filled on a days' notice for all kinds of

## BUILDING MATERIALS,

Rough or dressed dry, by which elegant and substantial work may be accomplished without delay at the usual cost for green lumber.

Orders for the interior filled at less than San Francisco prices and freights.

DOORS, SASH and BLINDS always on hand in large quantities. Address

## SIERRA FLUME AND LUMBER CO

## HIGHLY IMPORTANT.

## GOLD AND SILVER PLATING

AT THE SAN FRANCISCO PLATING WORKS,

653 and 655 Mission Street, San Francisco, Between New Montgomery and Third.

## THREE FIRST PREMIUM MEDALS

Awarded at the last three Fairs of the Mechanics' Institute.

Every description of goods (including table ware) from which the silver is worn, repaired and replated in the best manner.

Watches, jewelry, etc., plated with gold in the finest manner. A large assortment of new styles of Plated Ware and Cutlery on hand and for sale at lowest rates. New and elegant styles of Door Plates and Numbers furnished.

Gold-saving Silver-plated Amalgamating Plates for Miners' use, furnished to order.

EDWARD G. DENNISTON, Proprietor

## Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE &amp; CO.

Office, No. 320 Sansome street, Room 10.

## San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco

A 16 Candle Light for One Thousand Hours at a Cost of 30 Cents.

## WREN'S PETROLEUM GAS WORKS

Are now doing this in Towns, Cities, Mills, Hotels, etc., where in use. The same amount of light from coal gas, at \$3 per 1,000 feet, will cost \$15.

Send for references.

W. C. WREN, Cor. Jay &amp; Water Sts., BROOKLYN, NEW YORK.

## TOLLES' IMPROVED CONCENTRATING TABLES.

Improved Concentrating Tables.

The illustration on this page represents an improvement in concentrating tables for ores, recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by J. U. Tolles, of Virginia City, Nevada who has been using the apparatus very successfully in several places. In the engraving, A represents a flat inclined table provided with a surfacing of cloth or other suitable material of any kind, and with the ledges B, to prevent the material from passing over the ends. B represents a peculiarly constructed feed box extending along the upper edge of the table and provided in its front side with a row of discharge openings C, of the form shown, each narrowing down to its lower end and of such a size as the nature of the material requires. C represents a receiving box or trough, extending along below the lower edge of the table. D represents a leaf or board hinged to the rear side of the trough or box C, in such a manner that it may be

leaf D, is drawn (by the rod) under the edge of the table, the pipe being rotated or turned and the water thrown through the perforations upon the table in a row of fine jets, forming an almost continuous sheet or film. By means of the lever E, (which should be fastened on the pipe at right angles to the line of perforations), the tube is turned and the sheet of water swept over the table from the top to the bottom so as to drive all adhering particles therefrom and wash them down into the box C. After this operation the jets are stopped from the tube, the leaf drawn back, and the gate shipped to the other feed box, the feed water coming back on the first table, the operation being repeated as often as it is seen the tables are charged with the sulphurets or other valuable metals.

By employing the proper kind of cloth and giving the tables the proper grade, and properly regulating the flow of water the inventor finds that he can effect a very rapid and thorough separation without agitating the table, and without power of any kind except the manual labor requisite to change the feed from one table to another, and

kind of sizing apparatus in connection with the tables, the inventor is doing some close work with them at a nominal expense of constructing, running and keeping in order. He states that any person using anything of like nature, or any portion of the same for like purposes, without first obtaining license for so doing, will be prosecuted for damages for such use. Persons at a distance can build and run them by first obtaining license and instructions from the inventor, John U. Tolles.

**Additional Improvement.**—The operation of this improvement is as follows: The tailings are conveyed into the narrow end of the tanks, all of the coarser sands falling immediately below the current, the lighter being carried forward and deposited in its proper order, which causes a gradual sizing or separating from the coarser sands down to the very finest of the slimes; the latter being always the richest, and where the loss has heretofore been in all concentrating machines, as it is impossible to give current or motion to any machine that will keep the coarser sands free, without all of the slimes passing away

turned under the edge of the table to conduct the valuable material therefrom into the box, the refuse passing over the edge of the table and discharged upon the ground, or into the box in the rear of the box C. E represents a rotating tube or pipe suspended lengthwise above the upper edge of the table by endless belts D, passing over pulleys E, supported in the rigid frame F, or by brackets fastened to the frame and extending over the proper distance over the table, the tube resting and rotating upon them as shown in Fig. 2. The tube is provided from end to end with a row of perforations, and with a hand lever H, at one end, and is connected by a hose I, to a tank, pump or reservoir, delivering water at a pressure of from eight to 12 feet of head, as the nature of the case requires.

In operating the machine the feed box is narrowed to about one inch at its farther end, or has a strip of board set edgewise in the bottom and running obliquely across the same from the rear to the front side, causing the material to gradually be brought to the front and discharged through the feed holes C, upon the table, thereby insuring an even distribution and steady flow of the material to be treated; a steady and copious supply of water is maintained in the box, and the ores, sands or tailings introduced therein. The water escaping through the openings C, flows down in a thin light stream over the face of the table. The mineral particles are deposited upon and retained by cloth or other surfacing material on the face or bed of the table, while the light refuse matter is carried over the lower edge and discharged outside of the box C. After the collection of a suitable amount of metal upon the table, the supply of water, etc., to the feed box is stopped by the gate and turned upon the other table. Clear water is now supplied to the first pipe E, and allowed to run down over the table, (for a moment), washing off the remaining refuse sands, and at the proper time the hinged

washing them off by means of the water used in the pipes; he also finds by the employment of the fixed table he can separate particles which cannot be retained in machines which vibrate. By use of the feed openings C, of the form shown, the discharge of the sand, ore or other fine material is rendered very steady and gradual, as it will be carried through the narrower portion of the openings, while the lighter water will pass over the sand through the upper large end of the openings, taking up the material very gradually and distributing it very evenly upon the table. It is obvious that the rotating tube may be sustained in any other manner, and that it may be connected in any suitable manner with the source of the water.

The object in arranging the perforated pipe so that it can rotate is to permit a gradual change in the direction of the jets, so that their point of impact upon the table can be advanced from its upper to its lower edge, and thereby every portion of the surface subjected in turn to the direct impact of the jets, in order to effectually loosen and drive forward the particles therefrom.

The flow of water can be regulated by the valves operated by the cords. The gate shown in the feed trough G, will throw the water into either feed trough as desired. The plugs in the ends of the pipes E, are for the purpose of freeing them of any obstructions.

Fig. 3 represents the most convenient form of erecting the tank or reservoir which supplies the tubes with water, it usually being placed directly overhead with water shed underneath.

Mr. Tolles with this apparatus does not profess to do what many others claim to do, but he is running many of them where everything else has failed. He has been running several of these tables on the Comstock for nearly two years and is now building more. By using the proper

and being lost. This very effective, cheap and simple improvement completely overcomes this difficulty.

There are two of the tanks, so that one is filling as the other is being washed out, the latter operation being performed by a hose, the flow of water being regulated according to the grade of the material; commencing at the narrow end and using the full amount of water required to keep the tables clear, and gradually reducing the water as the slimes are approached in the wider end.

The perforated pipe at the narrow end is for the purpose of using a small amount of clear water under a light pressure, making an undercurrent to keep any slimes from settling with the sands. It is also used in washing out the tanks by letting on a full head of water, and having the holes so as to direct the water into the wider part of the tank, the water supply being all managed by cords leading to where the person stands in operating the machines.

The average size of the machines on the Comstock is from 30 to 50 feet long, by from 9 to 12 feet wide, and cost from \$125 to \$250 each. Those that the California and Consolidated Virginia companies have used for the last three years, cost about \$500 for the pair, are working about 700 tons of tailings in 24 hours, and getting from seven and a half to ten tons of concentrations per day, or about \$6,000 worth per month, only requiring the labor of one man, and the total expenses not being more than 50 cents per day of 24 hours (or 75 cents including the royalty).

The tables are working at the tail end of 12 strings of blanket sluices which are 1,200 feet long each. The price for the right to build and use the machines is from \$200 to \$500 per pair. Address

J. U. TOLLES, 824 and 826 Kearny Street, San Francisco, California, and full instructions will be given in detail.

## The "Devil Beans" of Mexico.

How Related to the Work of Gall Insects.

[Written for the Press by J. W. A. Wright.]

Among the many odd forms of insect life, none are more curious than the gall insects. Like all winged insects, they pass through the four stages of (1) the egg, (2) the larva or maggot, or grub, or worm, (3) the pupa, or cocoon, or chrysalis, (4) the perfect or winged state.

What especially distinguishes them from other insects is that, in the larva or worm state, they are found enclosed in cells of very varied forms and colors, which grow abnormally on different kinds of plants—including trees, shrubs and herbs. Oaks, hickories, cottonwoods, willows, sumacs, azaleas, rose-bushes, the golden rod and other herbs, and even grasses, abound with them. An odd feature marking all of them, and illustrating the great maxim—"like causes produce like effects"—is that in some way the galls containing the larva partake unmistakably of the nature of the plant on which they grow.

These cells or galls—the homes of the various larva—grow in the spring or summer as excrescences, because of the irritation produced either by the eggs deposited under the bark by the mother-insect, or by the young grub, boring into the plant in search of its needed food and protection, guided by the promptings of instinct.

The perfect or winged insects which deposit these eggs that are in turn to pass through the larva and chrysalis state into insects like themselves, in due course of nature, are quite varied in form, and belong to five of the seven groups or orders into which the true insects are now divided. Some of them are: 1. Clear-winged flies (*hymenoptera*), shaped like wasps and bees. Members of this group form our common oak balls, and the nutgalls of Asia Minor, such a necessary ingredient in making ink, and the celebrated Dead Sea apples, or apples of Sodom, found on the scrub oaks of southern Syria; also the pretty colored rose-galls, covered with prickles, and the noted joint worm, which often seriously damages our growing wheat, rye and barley. 2. Two-winged flies (*diptera*), shaped like mosquitoes, gnats and house flies. They form galls on willows like pine cones; apple galls and filbert galls, on grape vines; trumpet galls on grape leaves, and tube galls on dogwood leaves. The Hessian fly, so destructive to grain, is among these. 3. Bugs proper (*hemiptera*), like plant lice. Some of this group make the green, shining galls, and the rose-colored swellings on cottonwood trees, and the hollow, reddish galls on sumac leaves. This class includes the *phylloxera*, both the species which forms at least 16 different kinds of galls on hickory trees alone, and that notorious and dreaded species which has played such havoc in the vineyards of France and so alarmed the vine growers of California for a year or two past. 4. Beetles (*coleoptera*), consisting of a kind of weevil, which by its punctures and deposit of eggs causes swellings in grapevines and raspberry stems. 5. Scaly-wing insects (*lepidoptera*) or moths. There are fewer species of this group than in either of the first four mentioned. Their larva form swellings in the stems of the golden-rod, false indigo and perhaps other herbaceous plants.

Then besides these five groups, there are gall mites (*acarina*) which belong to the spider family, as they have generally eight legs, rather than to true insects which have but six legs. Yet they come pretty near the dividing line of true insects, as some of them have six legs. These little mites form purse-like galls on leaves of the wild plum and wild cherry.

This epitome of established facts in the interesting study of entomology or "bug-ology," whichever your readers choose to call it, is given for the better understanding of the accompanying description and engravings of the so-called

### Devil Beans.

Or jumping beans, found in western Mexico among the mountains a hundred miles or so inland from Mazatlan, Acapulco, and other coast towns, and frequently brought to San Francisco as curiosities by the Panama steamers.

Before fuller description, and for the better understanding of your readers, let me recall the description and engraving of the queer little "flea seed" given in both the *SCIENTIFIC* and *RURAL PRESS* of February 14th, 1874. No doubt many of your readers keep files of your instructive papers—as it would well repay all to do. But, for the benefit of those who do not, the engravings are here reproduced, that the difference between the "flea seed" of California and the "jumping beans" of Mexico may be more clearly seen.

As shown by Mr. Kinne, these minute galls, about the size of mustard or alfalfa seed, are found by the puncture and deposit of eggs on the underside of leaves of the California white oak by the insect here represented, *Cynips saltatorius*—engraving 20 times the natural size. As will be at once seen, this insect belongs to the first group above described.

The odd quality of their small seed-like galls is that they hop or bound about at a wonderful rate when warmed by the sun, or hand, or artificial heat; such motion being caused by the contraction, sudden straightening, and concussion against the sides of its shell, by the minute larva or worm inclosed in each, its antics being not unlike those of a "skipper."

We are now ready for the description of the curious jumping beans, with the insect which causes their odd movements, and the very accurate engraving in seven figures of natural size—prepared by your artists from nature espe-

Cynips Saltatorius and Its Flea Seed.

cially for your columns, and the first, perhaps, ever made.

For the beans used by the draughtsman and engraver, we are indebted to Mr. W. H. Richards and Mr. H. D. Pearce, of San Francisco. The engravings of the perfect insect, or moth, which is the original cause of the motions, and its chrysalis shell, are made from a specimen hatched out at the gold pen maker's shop of the latter gentleman on the corner of Montgomery and Merchant streets, where samples of the beans may be seen.

Fig. 1 represents the three so-called beans as they grow together on a small bush in the Mexican mountains, which is said to be somewhat like our hazel bush in size. Unfortunately, no one here, so far as we know, has been able to get specimens of the bush, so that it may be identified; but steps have been taken by which we may hope to obtain it. Hence, its exact nature botanically is not known, but because of the form of this supposed seed-pod, it has been conjectured that it belongs to the order *Euphorbiaceae*, which includes the spurge, palmar-christi, cassava, the box-tree (*buxus*), the Queen's delight (*stillingia*), caoutchouc-plant (*siphonia*), and the crotons, both the species producing the noted irritating oil, and that from which casca-rilla bark is obtained.

Fig. 2 shows how the three exactly similar parts or pods separate, while Fig. 3 is the single bean in the form in which it is usually seen, when placed on one end. It generally rests, however, on its round surface, or on one of the two flat faces, where the beans were joined. The white spot in Fig. 3 is a thin film, like the eye of a bean. If it is removed by the point of a knife, a thin white web is spun over the opening in a short time by the little yellowish maggot or larva, Fig. 4, which is very much like the worm frequently found in chestnuts. This

is the little occupant that gives, by his jerks and thumps against the sides of his home, the jumping power in which the truly wonderful feature of these beans consists. Each bean is very light, averaging in weight about two grains, and hence is easily moved by the larva. Place one or more of these beans in your hand, or near a warm stove, or under the rays of the sun or a gas jet, and though perfectly quiet before, and an entirely inanimate looking object, it will soon begin to turn from side to side; perhaps, with a sudden jump, turn completely over or stand on one end, and often, by its successive jumps, moving quite a distance. After watching the motions of this apparent seed-pod, very much like a fresh grain of coffee in color and shape, only larger and thicker, and with no semblance to any living form, you do not wonder at the name "devil-bean," given to it by our Mexican neighbors, who are prone to ascribe everything queer in nature, which they cannot understand, to the agency of his Satanic Majesty.

Keep one of these greenish, coffee-like beans in a moderately warm place, and, before a great while, the larva will have gone through its allotted changes; the perfect insect, a moth or fly, little more than three-eighths of an inch long, with light-brown, satiny wings, of uniform color and brown, hairy body, without any stripes or spots; will cut out at one end of his shell a small round piece, as nicely as if with a tiny saw, and crawls out enveloped in his chrysalis skin or sack, Fig. 5, which he soon leaves

Devil Beans and Insect.

near the empty pod which has so long been his home. Its appearance then, in a somewhat dormant state, is very accurately shown in Fig. 6. An excellent likeness of this moth is given, with wings extended, in Fig. 7—perhaps a very little larger than its natural size.

Now, as regards the relationship of the work of this moth to that of gall-insects. As is seen above, there are moths among the gall-insects. It has been conjectured, that the insect whose larva is found in the "jumping beans" is a gall-moth. Really we have not as yet sufficient data to decide with perfect certainty whether it is or not. To be a gall insect, the whole pod in which the insect is found would have to be caused by the juncture and deposit of the egg.

The strong probability is, however, that the so-called "beans" are the seed pod of some plant, and that the moth deposits its egg in the pod when very young—possibly even when in the flower state, as the troublesome apple moth deposits its egg in the apple flower. If so, the larva destroys the germ and cotyledons of the seed totally, leaving the mere shell. The reasons in favor of this view are: 1. The great regularity in form of the three united "beans." 2. There being no perceptible mark on the thin hull of the "beans" of any puncture of an ovipositor.

These and similar points are yet open to investigations, which are being made. It is a pleasure to state that Mr. Harry Edwards, so well known in connection with the California theater, and one of the best posted naturalists of this coast, is thoroughly investigating the matter, being in correspondence with the manager of the British Museum, London, and will soon give us a report, which will be looked for with much interest.

The devil-bean moth clearly belongs to the

group of *Lepidoptera*, or *scaly-wing insects*. Mr. Edwards thinks it is certainly among the *Tortricidae*, or family of leaf-rollers. Several of this family, like the apple worm, or codling moth (*Carpocapsa pomonella*), described in the *RURAL* of October 27th, instead of rolling their eggs and larva in leaves, deposit them in the young fruit of the plants to which they are partial, and are hence called bud-moths. Mr. Edwards thinks it quite likely this moth is a new species. On this and other interesting points he hopes soon to give us more definite information than is at present possessed.

December 3d, 1877.

## Quicksilver in Southern Oregon.

We learn from J. M. Sutton, an old Oregon pioneer, that quicksilver is being developed in the Rogue River valley, Jackson county. The first shipment of metal, consisting of 50 flasks, was made to this city last week, and was sold at 44½ cents for shipment to China. Mr. Sutton brought us an item concerning the mine from the *Ashland Tidings*, which we append, premising, however, that cinnabar ore which works 57% is rather rare, and they must not expect to find very much of that class of ore. Three or four per cent. ore is pretty good, and some considerably lower than that has been worked at a profit. The item referred to is as follows:

The Emeline mine is situated on the south slope of the Siskiyou, about four miles south of the State line, and consequently is in Siskiyou county, Cal. It is on a branch of Beaver creek, an affluent of the Klamath, and is about 35 miles from Jacksonville and perhaps 25 from Yreka. About 16 miles from Jacksonville the wagon road terminates, and only a horse trail extends from that point to the mines. The route is not a rough one, however, and a good wagon road could be made the entire distance at a moderate expense. The regular daily yield of this mine, with the retort now in use, is about 200 pounds. The ore is immensely rich, having yielded since operations began, although the process of retorting has been quite imperfect, 57% of pure quicksilver. This is better, we are informed, than the average yield of the New Almaden mine, in California. A single piece of ore, weighing 11 pounds, yielded 9½ pounds of pure quicksilver, and the probabilities are that there vast quantities of ore in the lead quite as rich. The mine seems of immense extent, and there is no estimating its value.

## Copp's Mining Laws.

Henry N. Copp's hand book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 26th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent postpaid for \$1, on application to Dewey & Co., 202 Sansome street.

ANOTHER TELEPHONE.—The telephone is being rapidly introduced for practical use. H. Royer, manufacturer of helting, has, for the convenience of customers, made a connection by telephone between his belting factory, 825 and 861 Bryant street, to the salesroom of the Pacific Saw Manufacturing Company, 17 and 19 Fremont street. By this simple means anybody may send a message or communicate directly with the factory without trouble.

It is estimated that the total yield of the Yellow Jacket mine, on the Comstock, from 1864 to the present time, has been \$14,372,172.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### A Trip to Lake County.

EDITORS PRESS:—Some time during the month of August last the writer, in company with a friend, made a flying visit to the sulphur banks in Lake county, and I send notes of what we saw on the way. Though late in the day, it may be of interest to some of the readers of the PRESS. The route chosen was via Pope valley, Butt's canyon and Long valley in Lake county. The first seven miles from St. Helena is up an easy grade to the summit of the Howell mountain. After crossing a low divide some two miles from St. Helena, we have the beautiful little Conn valley spread out suddenly at our feet. It is about eight miles long, very narrow but affords a delightful landscape with its grain fields, vineyards and pasture lands.

Where the road sweeps around the head of this valley, and at an elevation of 1,400 feet above tide water, is the residence of

Mr. Toland.

A nephew of Dr. Toland of your city. Mr. Toland came here some six years ago an invalid, given up to die, with that dreadful scourge of civilization, consumption. Being so far above the fogs and damps of the valley below, and in an air so clear and bracing, he was enabled to recuperate and enjoy comparative good health ever since; and with fair prospect of living many years yet among his fellow men of earth. Many afflicted ones visit this Alpine region every season during the summer months, some camping several weeks together, and all are benefited, especially those afflicted with asthma.

At the summit of the Howell mountain, some 200 or 300 feet above Mr. Toland's place, we found ourselves on a broad plateau of rolling country, heavily timbered with black oak and pine. Five thousand two hundred acres of this land is covered by a grant, which is now owned by the Napa Bank, except 200 acres containing all the improvements, which was sold to Mr. Anguin for \$9,000.

As much of this land is in the thermal zone or warm belt, where frost is seldom known, it is thought to be a favored locality for fruit raising, and acting upon this idea, the writer has since purchased a home on this mountain at an elevation of 1,500 or 1,600 feet above the sea, overlooking a portion of Napa valley, with St. Helena as a background just six miles distant.

Pope Valley,

On the north side of Howell mountain, is probably 15 miles long by from two to five wide. It contains many fine grain farms and sheep ranges. A narrow-gauge railroad from Napa City through this valley and Berryessa to Lake county, is now being agitated, and if put through, will be an impetus to trade in this direction.

The Phoenix quicksilver mine is located on the western rim of the valley. As it was not in operation at the time, we did not visit it; they having shut down for repairs.

A Mineral Spring

Has been discovered in the neighborhood of the mine, which is highly recommended by a Napa physician for bilious and rheumatic patients who may bathe in its waters. On learning that the first effect was to "rile" the stomach, we decided we were not much sick, so passed on to the first nice shade and there discussed the contents of a well-filled lunch basket which this "gude" wife had thoughtfully prepared for us. We left the valley by entering a narrow defile known as

Butts Canyon.

We had a lonely ride of some 10 miles under a midday sun, whose heat intensified to a tropical degree by the reflection from the steep mountain sides, which were treeless, rock-ribbed and desolate in this extreme. There was nothing to disturb the profound silence but the rustling sound of the lizard, as he slid over the hot rocks at our approach. The road was a good one, newly made, with no steep grades, but rather narrow for wagons to pass. This will be the principal outlet for the products of eastern Lake county until a railroad is built. There is neither mountain to cross nor toll to pay. The route is through Butts canyon, Pope valley and Childs canyon to Rutherford, in Napa valley, a distance of about 30 miles from Middletown, Lake county.

Guenoc

Is situated on the western confines of the valley, on the banks of Putah creek. Its prestige is gone. Middletown, its rival, four miles distant, has conquered. The last institution to go down was a "whisky mill," which struggled hard for an existence, but had at last to succumb to the inevitable.

Lower Lake

Is 12 miles distant from Guenoc, over a broken country, with little arable land until, within three miles of town, a small valley opens to view, which contains several fine farms. The

hill country is blessed with an abundance of oak and fir timber, and the higher mountains with immense forests of pine. Many saw mills are located in these forests, and are doing a thriving business in supplying the local market with lumber. Lower Lake is situated at the foot of some gently rolling hills, about one mile from the lake, which is not visible except by climbing the elevation in the rear of the town. The town has a good flouring mill, a brewery, a printing office, and several stores. A fine brick school house was erected about a year ago. An incendiary burned it down, but Phoenix-like it rose from its ashes, and now stands an ornament, and the pride of the citizens. The Lower Lake Bulletin is published here, a wide-awake journal, devoted to the interests of the people.

Borax Lake.

Nine miles from Lower lake, is about three-fourths of a mile long by one-half mile wide. It was lower this season than for many years, and the odors from its waters savored strongly of soap suds. Having heard its detestable qualities highly spoken of, we thought we would take a bath in its waters, but one examination found it contained myriads of living animalcules. My friend waded out some distance, but repented his rashness, for it produced a burning sensation of the skin for several hours. Extensive works were at one time in operation here, but the buildings are going to decay or tumbling down; and the scows that were once used for carrying the mud to the shore when dredged from the bottom of the lake are lying high and dry on its banks. After procuring some crystals of pure borax from the dried mud at hand, we proceeded on our journey, and on reaching the top of the hill near by, we had a fine view of

Clear Lake.

This lake is said to be 30 miles long and 15 wide at one point. We had an uninterrupted view over its beautiful clear waters for some 20 miles in the direction of Lakeport the county seat. Uncle Sam mountain looms up conspicuously on the opposite side of the lake from where we stood. At the foot of the hill and on the lake shore are the celebrated "Sulphur Banks" which has proved to be the richest in quicksilver of any mine on the coast, or perhaps in the world. The Supt., Mr. Tucker being absent, we could only learn these facts. In the month of July 1,056 flasks of quicksilver were produced, weighing each about 85 pounds. The force employed was 165 Chinamen and 35 white men. Three years of constant work has made but little impression upon this great "Bonanza" mine, and millions are yet in sight. The deadly gasses from the works have killed many acres of timber in the vicinity. In the mine is a large cauldron of boiling seething water caused by the sulphurous gasses making their escape through it.

There is a hotel and store kept here. Two little steamers touched in while we were there; the *Emma* and *City of Lakeport*, the latter connecting with a line of stages running from Calistoga to Lower lake. The passengers were allowed half an hour to visit the mine and works, when she blew her whistle and sped on her way to her destination, Lakeport.

On our return we were amused at the antics of that rare bird the "Road Runner." It was in a pasture not far from the road chasing grasshoppers. It would straighten out its long tail and neck and go with the speed of the wind for his intended victim and seemed unconcerned at our near presence.

Middletown.

In the Loconoma valley, has several stores, a good hotel, the Lake House, and several boarding houses and a restaurant; also a good livery stable and one or two churches. There are organized societies of Methodists, Presbyterians and Seventh-day Adventists. The village is built upon a dry gravelly plain, but its wells afford the best and coldest water in this part of the State. There are many good farms near the foothills that provide fair crops of hay and grain—a good market for which is found among the many stage companies and pleasure resorts in the neighborhood. Harbin springs is at the head of a beautiful little glen two miles from the town. Anderson's springs is five miles; both of them do a thriving business in the summer season.

Cobb valley, on the top of Cobb mountain, is 1,000 feet or more above the Loconoma. There is a good hotel kept in this valley at a place known as Glenbrook, for the benefit of visitors. We noticed a few apple trees in the valley that showed the same thrift, and healthy appearance as those of Mr. Anguin on Howell mountain.

From Middletown to Calistoga is 16 miles. Our route was over a good toll road through a long canyon, on the banks of a pearly stream, fringed with alders, laurels and arbovitae with a dense undergrowth, among which we observed the shrub honeysuckle. At the toll gate, which is at the summit of the divide between the waters of Lake and Napa counties, we halted and prepared for the ascent of

Mt. St. Helena.

Our route was by the Calistoga silver mine, which has not been worked for the last two years, for reasons best known to its owners. Alas, for the town of Silverado; when the mine shut down its glory soon departed, and it is so effectually dead that there is not a soul left to give its history. We followed a well beaten trail to the summit which is nearly 5,000 feet above the sea, and had spread out before us a panorama of surpassing beauty. You take in all of Napa valley at one view, with Mt. Diablo and the hills beyond an Francisco as a back-

ground. You have a good view of the valleys from Petaluma to Healdsburg in Russian River valley, with a glimpse of the ocean beyond. Knight's valley is at your feet, with the Yellow Jacket and Ida Clayton quicksilver mines at the base of the mountain. Turning to the northward and you see Middletown and the adjacent valleys in Lake county. The Great Western quicksilver mine is on the north side, right under the shadow of Mt. St. Helena.

Turning more to the eastward and you have a peep into the northern rim of Pops and Berryessa valleys, with a glimpse at the snow-capped Sierras. This completes the view that you obtain of six different counties, by simply turning once around. The mountain has two summits half a mile apart, with a deep round valley between, with an opening on the southwest side that drains it. It is probably an extinct crater, as the mountain is said by geologists to be of volcanic origin. In viewing the summit of the mountain as you pass through Knight's valley, you have only to stretch the imagination a very little, to see the outline of a female in a reclining position. And for this reason, we are informed, the Spanish travelers named it after Helen, the mother of Constantine. There is a good hotel at the toll gate to accommodate those that may wish to pay this grand old sentinel a visit, and I would advise tourists not to pass it by. We returned home by way of Calistoga and down our own beautiful Napa valley much refreshed and benefited in health from our trip to Lake county.

JOHN MAVITY.

Mountain View, Napa Co., Nov. 20th, 1877.

### Trees and Rainfall.

No 3

[Written for the PRESS by SAMUEL PURNELL.]

#### Influence of Trees on Climate.

In considering the influence of trees upon the climate and rainfall of the Pacific coast, we first encounter the impossibility of finding any records of the climate and rainfall of ancient times. Beyond the mere fragments handed down by the early Spanish discoverers, the records do not extend beyond a quarter of a century, a time too short to be of value in determining a change of climate.

Looking first at Arizona, we see extensive ruins of aqueducts and cities, showing the former presence of a large agricultural population. That Arizona, and, indeed, the whole Pacific coast, has been peopled by one race or another from remote antiquity does not admit of doubt. Some portions, as central Arizona, were densely settled. Western Arizona is now, for the most part, a sandy desert, destitute of trees, with but a few inches of rain during the year, and burned by a blazing sun. By what means, then, did Arizona once sustain her large population, and why is the country now a desert? Arizona had once an abundance of rain, and that within the general historical era and the present geological epoch. Now the rains have ceased, and these are the reasons why:

The moisture that now falls in scanty summer showers upon Arizona comes from the same monsoon that blows up the Mississippi valley; it crosses Texas and New Mexico, losing most of its moisture in passing over high mountains, and by the time it reaches Arizona its humidity is so greatly lessened that very little of its remaining moisture can be condensed, and the surface of Arizona does not offer the necessary conditions for condensation. When the rain fell in ancient times the surface of the territory was covered with forests; the air and earth were cool, and the moisture of the warm rain clouds was easily cooled and precipitated. But the ancient people, through ignorance, through selfishness, through domestic use, and through wars, slowly destroyed their forests. The results were most disastrous to them. Soon the summer rains ceased to descend, the hot and bare earth increased the dryness of the air. Only the winter rains then fell. To raise crops the people were forced to resort to irrigation, and the remains of great reservoirs and canals attest their struggle for existence. More trees were destroyed, and less rain fell in winter, and soon not enough to fill the reservoirs against the summer droughts. Then began the extermination of the inhabitants; no fruits or grains matured, the blazing sun parched the ground, and the sands of the desert slowly crept over the once smiling valleys. Most of the people starved, a few fled to foreign lands, and the remainder managed to subsist upon the mountains till exterminated by the Indians. The spoliation of the forests, the robbery of that part of nature which alone can make a country fertile and inhabitable, was the cause of their destruction, and not the Indians. Nature, just and kind and beneficent when understood and obeyed, permits no infractions of her laws, but drives from their country, or sweeps out of existence as unworthy of her continued favors, nations who commit the unpardonable sin of destroying her living forests.

#### The Rainfall Question in California.

California is at present most unfortunately situated in regard to rain. A large part of the State is uninhabitable, being nothing less than a hot, sandy and almost rainless desert. Except a narrow strip of coast, most of southern California is an uninhabitable desert, possessing indeed a few oases, like Los Angeles and San Bernardino, but in general it is given over to

desolation. The Colorado and Mohave deserts are as barren, as sandy and as completely solitary wastes as the great desert of Sahara, being inferior to the latter only in extent. In central California, while we do not find sandy deserts, we yet see vast tracts of mountain and valley lands upon which no human being lives, upon which nothing grows in summer for want of rain. It is the purpose of these papers to explain the causes of the want of summer rains and the consequent barrenness of most of the State, and to show how California may secure rain every month in this year, become wonderfully prolific and be inhabited to this mountain tops by a well fed and happy people.

### A General Sketch of Colusa County.

EDITORS PRESS:—Your request to be furnished with a few facts concerning Colusa county for publication, was received too late for many interesting details, as unfortunately no notes were taken by the way. A general view or such as can be given from memory must therefore suffice:

This county embraces a broad field of territory and in proportion to its extent, more than the usual amount of tillable land. A very large area of summer-fallow has already been put in, and everywhere for miles and miles, as far as the eye can reach, both hills and plains "stand dressed in living green" of grass or grain. The promise at present of an abundant crop could not be better. This chief product is wheat, with a strong re-inforcement of barley.

Colusa county is, perhaps, most celebrated for its large grain ranches. It is a small farm here if it contains less than 300 acres. A great many embrace from 400 to 1,000. A few more from 1,000 to 20,000, and one, at least (Dr. Glenn's), is said to cover about 60,000 acres, and believed to be the largest grain ranch in the world. For convenience of description, the populated part of this county may be divided into

#### Three Different Belts.

Extending its entire length from north to south. The first includes that portion lying along the Sacramento (and above the town of Colusa), covering a considerable scope of country on both the east and west side of the river. This second, and by far the largest body of arable land, is found on the plains and adjacent foothills and valleys on the west; while the third, and most westerly division, is confined to a series of beautiful mountain valleys, Bear and Indian being numbered among the larger, coursing also north and south, but supplemented by many a cultivated little nook or more sequestered vale around the point and beneath the shadow of some diverging mountain spur.

#### The River Belt.

Having crossed the tule from Dunnigan in the upper edge of Yolo county, to Grand Island, a pleasant evening was passed with Mr. J. D. Winters, a neighbor years ago, in Carson City. He is wide-awake to the improvements made in farming machinery, and has made some important inventions himself; simplifying and cheapening in particular the construction and working of certain parts of the grain-lifter, which may possibly be hereafter more generally introduced. From this large ranch, near the southern boundary of the county, as far north as St. John's and Butte City, two lively villages not far from its northern limits, the soil along the borders of the river is a very rich alluvial deposit, and for the most part under a very fine state of cultivation. Colusa, the county seat, is situated on the west bank of the Sacramento, about midway in the belt and is quite a business place, being this center, not only of the trade of the rich section of its immediate vicinity, but also for that of much of the most distant settlements in the county. The town of Sycamore, a few miles below, and Princeton and Jacinto, some distance above, all have good surroundings and present an appearance of considerable thrift.

#### The Plains and Foot-hills.

Improvements have advanced very rapidly in the central belt, more especially along and near the line of the Northern railroad. College City, the most southern town and three miles from the road, derives its name from a flourishing institution established here (usually numbering 100 pupils and upwards), and is supported mainly by residents for educational privileges. Williams, the present terminus, has quite a number of large, substantial buildings, among the number a spacious hall fast approaching completion. It gives evidence of much thrift and promise for permanence. Arbuckle is the only town of any note south of the terminus immediately on this road, but on the projected line north, several rapidly growing villages are found. Occident, the smallest, comes first. Willows, the next in order, is the largest along the whole line, with a good country surrounding it. Germantown, a few miles above, is not far behind its neighbor in the race, and is settled up chiefly, as indicated by the name, from Germany.

Orland, in the upper part of the county, covers a good deal of ground, the buildings being usually small and mostly wooden, but hosts a large grist mill, now nearly ready for running.

#### The Mountain Valleys.

The principal villages of this western belt are

(Continued on page 359.)

## MECHANICAL PROGRESS.

## Our Mechanics Should Have Government Work.

It is notorious, says the *Commercial Herald*, that every Government vessel arriving here from the East is obliged to undergo repairs before being placed upon active service, and yet, after three or four years' mild cruises in the Pacific, they are ordered to Atlantic navy yards for extensive and costly repairs, although they could be done here much better, quicker, and at less than two-thirds the expense. The machine shops at Mare island yard are fully equal to any in the United States; the necessary material is bore in quantity and of superior quality; work can be prosecuted steadily and nearly every day in the year, unimpeded by snow storms and other disturbing causes which frequently prevail at the East; the cost of sending a frigate or sloop-of-war round the Horn with her complement of men, etc., is equal to about one-third the entire expenditure for necessary repairs; boiler and engine work of all descriptions can be done here equally as well and as cheaply as at the East, and there can be no valid reason why ships of war should be ordered from Pacific to Atlantic stations for repairs. It is admitted by naval officers that California salt-beef is much better than anything of the kind received from the other side, and we might go on and enumerate many other articles in support of our position. It was only with difficulty and after many urgent appeals that permission was given to build and equip a revenue cutter or two on this coast, but the experiment, as it was called, has resulted in triumphant success. It cost nearly as much to send the *Lincoln*, *Wayanda*, and others of that class around here, and put them in condition after arrival, as it did to build them. They were condemned and sold for a song soon afterward, while the *Oliver Wolcott, Jr.*, built here, has not yet cost a dollar for repairs, although several years have elapsed since she was launched and placed in active service. It cost \$20,000 gold to send the *Lincoln* to California and \$17,000 more to put her in condition after arrival, yet she was sold for a mere trifle shortly afterward. The manner in which California has been treated in this respect is simply infamous, and all the more so in view of the glaring fact that she contributes over \$3,000,000 per year to the Federal revenues.

## The Mechanical Treatment of Metals.

In a paper by Prof. R. H. Thurston, in the *Metalurgical Review*, under the above heading, the author states that it is perfectly obvious that means of effecting great changes for the better in the qualities of the commercial metals are available, and there is no reason why we should not have vastly more valuable materials than those with which our markets are generally supplied. He gives the following as the proper methods of preparation of metal to secure a maximum value:

1. Reduce this metal to the molten condition, flux thoroughly with such a flux as will remove first, all deleterious substances with which the metal may be contaminated; secondly, every particle of gaseous oxygen and of oxide, and, thirdly all other occluded gas liable to produce "blow-holes."

2. Cast the metal under heavy pressure, in order to secure maximum density and to close up every pore as perfectly as possible. If the metal is an alloy which is liable to liquation, it should be cast in a chill of sound iron and of considerable thickness.

3. If the metal is either iron or steel, produce any considerable change of shape which may be desired by rolling, by the drop press or by hydraulic forging, at a full red heat, and permit it to remain unused as long as possible, in order that the internal strain, unavoidable to some extent with any method of treatment, may be given time to become reduced by that process of flow which will ultimately relieve it. If stiffness and a more perfect elasticity are demanded, finish by the process of cold working, taking great care not to carry it so far as to seriously injure the continuity of the metal.

4. The bronzes and other metals of the inelastic and viscous class may be given very considerable modification of form by the process of working cold. The same precaution must be taken to avoid destruction of continuity, and thus by the production of incipient fracture permanently and seriously injuring it.

## Gauging Wire.

General dissatisfaction has been expressed with the old style of wire gauges. The subject was brought up at the last meeting of the American Institute of Civil Engineers, and a report from a committee was heard. The committee call attention to the inaccuracy of most of the gauges in use. These they divide into two general classes, first, fixed, and second, movable gauges.

The fixed gauges consist of a steel plate, either made with slots open at one end, the sides of which are intended to be parallel, with round holes and sometimes with a plug to fit the holes, or of a V, either cut into a plate of steel or of two bars placed together. These fixed gauges were found to be only approximately correct. Not only those made by different manufacturers did not agree, but in those

made by the same manufacturer there were often "very perceptible and annoying differences."

Two kinds of movable gauges are described, "sliding callipers with verniers and with or without a micrometer screw for adjustment and the micrometer screw gauge." The latter is spoken of as the simplest form and is recommended for adoption as the standard gauge. The committee recommend the abandonment of the fixed gauges and the practice of designating dimensions and sizes by number—meaning number "wire-gauge," as it is often written—for commercial use, and the adoption of the system of expressing signs in thousandths of an inch or fractions of a millimeter. There is probably nothing to prevent any one from doing the latter in this country if they choose, but at present the use of doing so is not apparent.

It is to be hoped, however, says the *Railroad Gazette*, that the barbarous old wire-gauges will be condemned to the scrap-heap and that the more accurate and precise micrometer gauges will take their places, and that instead of designing wire and plates as such a number "wire-gauge," which instead of being precise is quite the reverse, the practice of expressing such dimensions in thousandths of an inch will come into universal use.

## The Points Involved in a Joint.

In all wood-working the proper connection of the parts is an essential element, and in designing or executing joints and fastenings in wood-work, the following principles laid down by Prof. Rankine should be adhered to, viz.:

1. To cut the joints and arrange the fastenings so as to weaken the pieces of timber that they connect as little as possible.

2. To place each abutting surface in a joint as nearly as possible perpendicular to the pressure which it has to transmit.

3. To proportion the area of each surface to the pressure which it has to bear, so that the timber may be safe against injury under the heaviest loads which occur in practice, and to form and fit every pair of such surfaces accurately, in order to distribute the stress uniformly.

4. To proportion the fastenings so that they may be of equal strength with the pieces which they connect.

5. To place the fastenings in each piece of timber so that there may be sufficient resistance to the giving way of the joint by the fastenings shearing or crushing their way through the timber.

To these may be added a sixth principle not less important than the foregoing, viz.: To select the simplest forms of joints, and to obtain the smallest possible number of abutments. The reason for this is that the more complicated the joint, or the greater the number of bearing surfaces, the less probability there will be of getting a sound and cheaply made connection. To insure a fair and equal bearing in a joint which is not quite true, it is usual after the pieces are put together to run a saw-cut between each bearing surface or abutment; the kerf or width of cut being equal in each case the bearing is then rendered true; this is often done, for instance, with the shoulders of a tennon or the butting ends of a scarf, when careless workmanship has rendered it necessary. When the visible junction of two pieces is required to be as close as possible, and no great strain to be met at the joint, it is usual to slightly undercut the parts and give clearance on the inside.

THE TELEPHONE AS A FIRE ALARM.—We find the following in an English exchange. We have not seen the fact published in this country: Prof. Graham Bell's telephone gave the first notification of the fire at the Patent Office, but unfortunately what it said could not be understood. Nor is this to be wondered at when I tell you what happened. The model of the telephone deposited in the Patent Office was on trial by one of the officials, who suspected that his private office was occasionally entered by improper persons. He made the necessary connection with his own room at his hotel, and hoped to be apprised of the noise of entry, so that he might rush out and secure the offender. The first sounds were those of the burning office, a dull hissing noise, that engaged the attention of the official and of some friends that were with him in vain attempts at interpretation until the fire was fairly started. The language of fire was unknown.

REDUCING ALUMINIUM.—According to *Dingler's Journal*, in almost the only factory for the production of this metal, in Salindres, near Alais, the mineral bauxite is heated with soda in reverberatory furnace, the resulting aluminate of soda is extracted by means of water and alumina, precipitated by a stream of carbonic acid; this is then formed into balls, with salt and coal, and heated to a white heat in vertical retorts during the introduction of chlorine gas. The double chloride of soda and alumina, which distills over, is fused with the addition of 35% of sodium and 40% of cryolite as a flux, and the metal which settles at the bottom of the crucible is poured into molds.

HARD RUBBER BEARINGS.—The *Polytechnic Review* says: Hard rubber (vulcanite) on brass or any other metal will, when used under water, subject to friction, wear a dozen times longer than any two metals under the same usage, and hard rubber on hard rubber or glass is almost indestructible.

## SCIENTIFIC PROGRESS.

## Moonlight on Mars.

The following calculations concerning the moon of Mars (in *Scribner* for December) have been made by Lieut. Sturley, of the Naval Observatory, with the approval of Prof. Hall, the discoverer: We might at first conclude that the inhabitants of Mars, if such there be, would witness the extraordinary sight of two brilliant moons passing each other in the heavens above them, but a little further reflection will show that to all intents and purposes Mars has but one practical moon, and that as far as light reflecting is concerned the outer one is a most useless attendant. The inner moon being 15 miles in diameter and 3,500 miles away would from the surface of Mars subtend an arc of 23', which would give it an apparent size of about three-quarters of our moon.

Now the outer being but 11 miles in diameter and 12,000 miles away would subtend but about 3' of arc, and as the naked eye, that is, the human eye of this earth, can but barely see a celestial object which subtends 1' of arc, it follows that to the inhabitants of Mars their outer satellite would appear to be a little larger than Mars does to us. We may therefore conclude that for the people of Mars there is but one practical moon and that that one rises in the west.

Again, supposing that this inner moon should rise on a certain evening at 6 o'clock, it would set in the east at 11h. 34m., and rise again in the west at 5h. 9m. the following morning—set again at 10h. 43m. in the forenoon to rise once more at 4h. 18m. in the afternoon, and so on. Thus to the men of Mars the moon rises twice in the same night.

Let us see now how his moonlight nights would compare with ours. Supposing his moon and ours to rise at 6 o'clock in the evening. At 6 o'clock next morning we would have had nearly 12 hours with our moon above the horizon, while the Martians would have had light from theirs but 6h. 25m.—that is, counting from 6 o'clock in the evening to 6 o'clock the next morning. But, on the other hand, the Martians have their moon every night, which is a boast we on earth cannot make.

There is still another interesting phase of Mars' moons. Speeding through its orbit in 7h. 40m., each quarter will consist of but 1h. 55m.; thus, as in the former case, supposing it to rise at 6 o'clock in the evening, and at that instant of time to be full moon, at 7h. 55m. it will have reached its last quarter, at 9h. 50m. it will be new moon, and at 11h. 45m., eleven minutes after setting, it would reach the second quarter. Thus in one night the Martians will see their moon passing through all the phases, which with us and our moon require more than 27 days.

## The Composition of Wool.

At the recent meeting of the French Association for the Advancement of Science, held at Havre, M. Ladureau read a paper on the composition of wool, showing that the generally adopted opinion that this material contains mineral salts is absolutely without foundation. Actually pure wool contains no such salts whatever, and now-a-days it is cleaned and prepared for manufacture so admirably that very ordinary samples will leave no trace of them on careful examination, unless it be a very minute proportion of potash or soda absorbed in the process of washing. A very long series of experiments made by M. Renouard on numerous samples of different kinds of wool gave the average amount of ash in 100 grammes of wool as 0.645 gramme only, the most impure of all containing 1.24 gramme, while the finest and best prepared English wool yields but 0.02 gramme of ash in the quantity named. The proportions of different salts found in the average ash were as follows:

	Per cent.
Carbonate of potash.....	43.34
Carbonate of soda.....	17.16
Chloride of potash.....	14.15
Sulphate of potash.....	9.24
Carbonate of lime.....	6.07
Sulphate of lime.....	2.06
Phosphate of lime.....	0.70
Silicate of alumina.....	2.28
	100.00

Nitrogen, therefore, is absolutely absent and must be artificially added if wool refuse is to be used as manure. M. Cornwinder and Peligot endorsed these observations from their own experiences, and M. Ladureau expressed the opinion that when soda is found at all in prepared wool, its presence must be referred to the soap used in the process of cleansing the fleece.

A SICK WHALE.—A white whale (*Beluga borealis*) was lately carried to England from America for the Westminster Aquarium. It was very thin when it arrived, not having eaten anything for twelve days, and the spinous processes protruded two to three inches along its back. It was fed on eels, and seemed to improve rapidly, but died in a few days. Dissection proved that it died of inflammation of the lungs, which has surprised people, as occurring in an aquatic species. But a whale's fat is its clothing, and it is not strange that it should catch cold when its clothing is used up.

## The Antiquity of Man.

This hoary topic has been last discussed by Prof. Dawkins, of the Manchester, England, Geological Society. He thinks that in taking stock—to use a mercantile term—of the net results of geological and palaeontological inquiry during the last session, the additions to our knowledge had consisted in detail rather than the discovery of great principles; and the ground already conquered from the region of the unknown had been resurveyed and more minutely parcelled up, instead of being increased by large slices of territory. He referred to the recent discoveries at Creswell Crags, on the borders of Derbyshire and Nottinghamshire, by which the fact was established that even in the palaeolithic age the hunters of the reindeer, horse, mammoth and other creatures were progressive, and that the cave-dwellers of the pleistocene age were to be looked upon from this same point of view as mankind at the present time—as one man, always living and incessantly learning. Among the additions made by these caves to the fauna of the north of England was that of the great saber-toothed *Machairodus latidens*, which hitherto had only been met with in two caverns—in Keut's Hole in Devonshire, and that of Baume in the Jura. The figure of a horse upon a rib bone was identical with those left behind by the hunters of reindeer in the caves of Auvergne, and therefore proved that the inhabitants of the Creswell caves during the time when this upper stratum was being accumulated was in the same stage of artistic culture as the cave-dwellers of southern France and of Switzerland. From the discoveries in the caves in France, he (Prof. Dawkins) had arrived at the conclusion that these people were represented in the present age by the Eskimos. This, however, must be viewed as a probable hypothesis rather than a well ascertained fact. The evidence offered by all the caves in the area from the Alps and the Pyrenees, as far north as Derbyshire, was clear that palaeolithic man lived in Europe while large numbers of reindeer were also living here; or in other words, in the pleistocene state, when the Arctic animals were abundant.

ACTION OF NITRO-GLYCERINE.—The temperature developed on the explosive combustion of nitro-glycerine, says the *Engineer*, has not been accurately ascertained, but as the combustion is much more perfect than is the case with gunpowder, it is probably much greater, and has been assumed to be more than twice as great. One volume of powder gives 190 volumes of gas at the ordinary temperature; in consequence of the heat developed, this gas expands to four times this volume, giving 760 volumes of gas directly after the explosion. One volume of nitro-glycerine gives 1,300 volumes of gas at the ordinary temperature, and assuming as pretty nearly correct that the heat developed is two and a half times as great, we should have the gases expanded to 10 times their volume at ordinary temperatures, of 3,000 volumes of hot gas; so that according to volume the strength of the nitro-glycerine is 17 times that of gunpowder. But in consequence of the enormous velocity of combustion of nitro-glycerine, its impact effect is still more increased. With nitro-glycerine larger masses of rock can be operated at one blasting, in consequence of the severe shattering power which its rapid combustion confers upon it. At the slate quarries in north Wales, where nitro-glycerine was for some time used, a single blast with nitro-glycerine sufficed where previously four or five blasts with gunpowder were required. Similar favorable results were obtained at Freiberg and in Belgium.

JAPANESE BOTANY.—An interesting evidence of Japanese education and enterprise was brought to the *Alta* office the other day—a book containing samples of 100 species of Japanese wood, with the botanical name of the genus and the species in Latin and in Japanese, and notes in Japanese. Three samples are given of each species; one transverse and two longitudinal, and of these one radial and the other tangential, or at right angles to the radius. Thus the grain of the wood is shown in every position. The samples are very thin, some of them not the hundredth part of an inch, so that when pasted in the book, they do not make it clumsy. We presume that it is entirely the work of natives of Japan, and though the idea is not original with them, the manner of its execution does great credit to their country. The *Alta* announces that Justin P. Moore has for several years been working at intervals to produce a similar book of the woods of California.

HONEY AND THE MICROSCOPE.—Under the microscope, the solid part of honey is seen to consist of myriads of regularly-formed crystals; these crystals are for the most part exceedingly thin and transparent, and very brittle, so that many of them are broken and imperfect; but when entire they consist of six-sided prisms, apparently identical in form with those of cane sugar. It is probable, however, that these represent the crystals of dextrose, as they occur in honeys from which cane sugar is nearly or wholly absent. Intermingled with the crystals may also be seen pollen granules of different forms, sizes, and structure, often in such perfect condition that they may be referred to the particular plant from which the juices have been gathered.

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**STRECK COAL.**—Amador Ledger, Dec. 1: We are informed by Alex. Thompson, of Buck's Vista, that Wm. Cook, of Jackson valley, is boring for an artesian well, a few days ago, struck a seam of coal of unknown thickness. The coal is said to be far superior to any heretofore discovered in the valley. Indeed, the coal is good enough to heat iron to the welding point—something that blacksmiths cannot do with lone coal. In case the bed proves to be extensive, which there is no reason to doubt, the discovery is of great value and will have an important bearing upon the future of Jackson valley.

The Kennedy mill is expected to be ready for the commencement of hostilities upon the huge piles of quartz, which have accumulated on the dumps week after week.

The Tallman company have secured drilling machinery of the latest pattern, worked by compressed air.

**MISCELLANEOUS.**—The Yoakes gravel mine, at Butte, is running with a small head of water. It prospects big and will give a good account of its wealth this season. The Crown Point mill and mine at Drytown have started up. Rumors are current of a big strike in the Tallman. No particulars are known. The Gover looms up as the prince of Amador mines. It continues to develop grandly.

**WORK COMMENCED.**—Amador Dispatch, Dec. 1: The work of prospecting the old Moore mine, near Scottsville, about a mile south of Jackson, was commenced in good earnest last Monday morning, by Messrs. Hewitt, Hill & Co., which was bonded by them a few days ago for one year. It is a well known fact that a large amount of very rich rock was taken out of this mine in the early days of quartz mining in this county, and there is but little doubt now, that under the improved methods of extracting gold from quartz, the mine can soon be made a valuable piece of property. The gentlemen who have undertaken this enterprise are well known to be responsible men and practical miners.

### BUTTE.

**COLD.**—Oroville Mercury, Nov. 30: Last Friday the Spring Valley company sent down a couple of gold bars valued at \$55,000. This is the beginning of a clean-up that will last two or three weeks.

Just across the river from town is the Powers' claim, mining day and night. A large volume of water falls over the bank upon the pile of gravel that has fallen down, while from below the Chief sends against it a stream with a force sufficient to make the gravel fly in every direction. It is said that this stream has force enough to batter down any brick wall in town. The claim is turning out a golden harvest each month.

**BIO BAR.**—J. C. Logan and a party from San Francisco, visited the Big Bar mining claim on the North Fork last Monday. Everything is in complete readiness to run as soon as they have a sufficient head of water. The gravel prospects well and they have an abundance of it before them. From two pans taken from near the bedrock they got about seven lbs. The gravel in the immediate vicinity of where this was taken from is equally rich. How much of it there is, is a deeply interesting question to the owners, who are very anxious for the rains to come in order to fully test the claim. It may prove to be the best kind of a claim, and it may be a delusion as many another claim has proved.

**QUARTZ MINING.**—Mining in quartz in Butte county has been carried on in times past with different degrees of success. We have yet to learn that any who have been engaged in the business, have made a success of it. Still there are a number of ledges that are at the present time being worked. Over in the Evansville mining district is the Honcutt quartz mining company, hard at work in the hope of finding a good ledge. The members of the company all belong in Santa Clara. They have a four-stamp steam mill and all the requisites for crushing rock. They are now down on the Honcutt ledge 100 feet and have a small vein of pay rock that promises well if it continues on. On the way down they have passed through various stratas, some of which were quite rich. We met J. H. Miller, the Superintendent, in town this week, and from him learned that the water was rushing in on the ledge so fast that it was necessary to get a pump. He was in for that purpose. We hope to hear that the ledge is a good one, and that it will pay. Near it is one worked by Mr. Griffith that is rich in places. If the mill was on his claim it would turn out a good day's work each day.

### CALAVERAS.

**EXTREMELY RICH QUARTZ.**—We learn that Mr. Andrew McFadden lately discovered a very rich quartz ledge on his ranch, on the West Point road, about three miles above here. Mr. McFadden crushed up five pounds of the rock, obtaining two ounces and 84 in gold. Richer rock than that has seldom been heard of in this country, you take it. We have not learned how extensive the deposit is, but shall await further intelligence with regard to development with lively interest.

**EXPLOSIVE.**—Seventeen giant powder cartridges blew up in one of the levels in the San Bruno at Mosquito the other day. Fortunately the men bad just left the drift and no one was hurt. A candle dropped into the box among the cartridges and primers.

**GWIN MINE.**—While we have nothing particularly new from the Gwin mine our intelligence is altogether favorable. The stopes on the 1300-ft level continue to yield their usual quota of good ore, keeping the batteries in constant employment. The work of running the 1300-ft level is progressing steadily. The outer edge of the chute has been reached, the ledge showing very wide, the ore as yet being inferior in quality. That it will improve, however, there is no question, that having been the unfailing result in all the levels above. The work of repairing the lower mill is nearly completed, which will render 24 additional stamps available. The mine continues its average yield per month.

### EL DORADO.

**WAITING FOR WATER.**—Mountain Democrat, Dec. 1: Ben Mason reports that the mine owned by himself and Mr. Kelsoe, of the Pacific house, is now in trim, ready for a run as soon as sufficient water comes. They are digging a ditch, which, when completed, will bring water from Silver creek; but, for this season, will have to depend on catchment water on this side of the divide. The mine is situated about two miles east of the Pacific house.

The Park canal and mining company is in the same condition, the water of Camp creek not being available yet, and Park creek being too low to furnish a supply to run the mine.

### INYO.

**PROSPECTING.**—Coso Mining News, Dec. 1: Quite a large number of men are taking advantage of the cool weather, and have gone, in different directions prospecting. Plenty of leads yet to be found in this section.

**New Coso.**—It is reported that an immense strike has been made in the Lucky Jim within this last few days.

**BRIDGES SUPPLIES.**—Last Sunday, Peter Taylor, Superintendent of the Emigrant mining company, shipped to San Francisco, per Wells, Fargo & Co.'s express, 149 pounds of fine silver bullion, valued at \$2,000. Same day the Rex Montis company shipped 173 pounds, valued at \$1,600. On Saturday, the 24th (after we had gone to press), J. S. Childs, Superintendent for the lessees of the Hidalgo mine, shipped to the same company, 173 pounds of silver bullion, valued at \$1,600. The same day, per Cerro Gordo freight company, to San Francisco.

**THE NEW MILL.**—Inyo Independent, Dec. 1: Lumber and timbers from Stewart's mill, at Big Pins, has been continually forwarded to the Rex Montis mill for the new addition. Five more stamps are to be added to the battery, with pans and all other machinery requisite for a complete institution.

**NEAR STRIKE.**—Messrs. Bowen and English, through the good offices of an Indian, are reported to have made a good strike down the San Lucas canyon, on the eastern slope from Cerro Gordo, in the shape of a large quartz ledge, showing fine, coarse gold.

**LEE DISTRICT.**—The Union Con. furnace at Cerro Gordo has been working some of the rich chloride ores from Lee district, shipped in by C. S. Mott, with results satisfactory to all parties.

**UNION CON.**—The new works are in full operation to the 700-ft level, the repairs on the shaft below that point to the bottom of 900 still going on. It was mostly filled up, and will require some time to complete the work of clearing. Some ore is coming out, but so far nothing like such extensive bodies of ore as distinguished the old works have been encountered. One furnace is in steady operation upon ores from the old workings. The San Felipe silver ledge, now opened at several levels, contributes its quota of rich ore, and the statement is made to us by a stockholder in the company that the last month's work of the single furnace has produced the sum of \$27,000 clear.

### NEVADA.

**FLEMING.**—Nevada Gazette, Dec. 1: The Fleming mine, situated on the bank of Deer creek, will be one of the bonanzas when it is fully developed. He has now on the dump about 20 tons of rock, which will pay from \$30 to \$40 per ton, and has a ledge in the face of the tunnel, which, when mined, could be worked by a four-foot vein and looks as well as any that he has now on the dump. He has some difficulty in holding the rock from the bed of the creek, but this will be overcome in a few weeks.

**THE JOHNNY SCHMIDT MINE.** Located near Wood's ravine, is one which can be easily worked. When they get their machinery in full working order they intend to sink an incline, from which they can take out about twice as much rock as they could with the rock they are at work by at present. Their ledge is from three to three and a half feet in thickness, and is good rock, paying all the way from \$30 to \$50 per ton.

**VALUABLE GROUND.**—San Juan Times, Dec. 1: The Patterson placer mining company, embracing about 400 acres, owned by Joseph Hustler, Wm. Bristow, J. Nan Kervis, John T. Morgan and many others, and situated near the town of Pioche, is about to apply for a United States patent. This claim embraces some of the most valuable ground on the ridge, extending from Chimney hill to the south line of the Badger Hill company's ground. It is contemplated by the owners of the Patterson placer mine, as soon as their title is made secure by patent, to run a tunnel into the ground from the Badger hill side. This will require much time and a heavy outlay in money; but, when completed, the owners will be amply repaid.

**WEATHER.**—Nevada Transcript, Dec. 1: This kind of weather is rough on this placer miner and the farmer. From appearances two weeks ago, we should have predicted a heavy rainfall during the present winter; but the weather changed and at the present time the air is as balmy as spring. Just think of roses in bloom in the heart of part of November and ripe strawberries in the market.

**ROYAL.**—One of the most promising mining properties in the county, located on Piety hill, on the old Grass Valley road, formerly owned by Geo. W. Smith, a widely known Nevada county man, has recently passed into the hands of a party of San Francisco capitalists, who have organized a company under the name of the Royal mill mining company. The property embraces a tract of 160 acres, well timbered and watered. The claim is 5,000 feet in length by 200 in width. The ledge is what is known as a north and south ledge, with a dip to the east of 45°. The property is secured by Government patent and has long been regarded as one of the most promising in the State. It has been developed by drifts and shafts to the extent of 1,000 feet. The character of the rock is from medium, averaging \$30 per ton, with deposits of very rich ore, running from 10 cents to \$1 per pound. The present machinery is capable of working the mine to a depth of several hundred feet. A 10-stamp mill has just been erected near the property, within a convenient distance of the mine. It is the intention of the company to actively prosecute work and to fully develop the property to the interest of the stockholders, with a certainty of making it a dividend-paying mine in a few months.

### SIERRA.

**RICH DRIFT.**—Mountain Messenger, Dec. 1: The Iowa company are getting out some very rich drift. The richness of that mine is no longer problematical.

**EXPENSES.**—Experts and capitalists from the Bay have been up looking at the Monte Cristo quartz company's property.

**ALL READY.**—The Pioche company has all ready to run a few days since and is now, probably, pushing down their shaft. The machinery works finely.

**FINE PROSPECT.**—The Brush Creek mine has a fine prospect for quartz. The ledge has again been struck at a depth of over 200 feet, and with such richness as former workings. The vein is no doubt a true fissure, and will extend downward indefinitely without doubt.

**WILBOURN CON. Mf. Co.**—This company, owned by Wm. Wilbourn and others, is located on Thompson ridge, about four miles from Whitney's upper saw mill. A shaft was sunk 80 feet last fall, but was abandoned on account of water. The company have now commenced to run a tunnel, which will be about 500 to 600 feet in length. It is expected will tap the channel some 40 feet below the bottom of the shaft, which was in fine looking gravel when work was stopped. The company started their tunnel so as to be sure and be low enough. If a pay channel is found it will be the means of opening up a large amount of mining ground. Messrs. Foss & Thompson have the contract for running the tunnel. They are also owners of claims in the Pioche district. Wilbourn has taken a great interest in the development of mines in this ridge, and it is mainly through his instrumentality that the above work is going ahead.

### SONOMA.

**GEORGIA QUICKSILVER MINE.**—Healdsburg Enterprise, Dec. 1: The Georgia is situated about 2½ miles southeast of Pine Flat, and is, in Mr. Nixon's judgment, destined to become one of the most valuable mines in the State. He is an old prospector, and says he has never seen ore so equal that found in the Georgia. He located the mine November 27th, 1875, and started a tunnel. The mine afterwards passed into other hands, and the work of development was only just commenced when the great decline in the market value of quicksilver caused a cessation of work, which has never been revived. We have specimens of ore from this mine that are remarkable for their richness, and we believe, like Mr. Nixon, that the time will come when the Georgia will be one of the most prominent and best paying tin mines in California.

**TIBURCIO PARROT, OF SAN FRANCISCO,** was up to look at the mine recently; should it pass into his hands, he has the capital to fully develop it. At all events, it is certain to be developed.

### TUOLUMNE.

**WATER.**—Tuolumne Independent, Dec. 1: There is about 75 inches of water in the Phoenix reservoir, enough to supply Sonoma, and with a few firearms for militiamen. The springs are raising, and water in the reservoir is increasing; it now being water-tight. Were it not for this receptacle, our citizens would be in a bad fix, as there would be no water to run the pump, which raises a supply into the distributing reservoir on Gold Mountain. Water is also run every night into the Cannon Hill reservoir for the purpose of filling the Phoenix.

The Tuolumne Water Co. are now all repaired in first-rate order, the Phoenix reservoir being rebuilt in a substantial manner, and hands discharged. The ditches have all been cleaned out, the flumes repaired, and the whole line of works are in first-class condition. All is now ready for the clerk of the weather to shower down his blessings.

## Nevada.

### WASHOE DISTRICT.

**UTAH.**—Gold Hill News, Dec. 5: The north drift on the 1150-ft level is steadily advancing, the face in porphyry. The week has been expended in repairs and enlarging the south drift on this level, so that no crosscutting from this drift has yet been attempted. The north and south drifts on the 1250-ft level are each advancing in more favorable ground than for some time past.

**COK VIRGINIA.**—Daily yield 600 tons of ore. In addition to the 29 stamps added recently to the California battery mill, the Nevada mill has been started up on ore from the mine. The ore stopes on all these levels are looking well and yielding rich ore, and the prosperity of the mine appears as great as at any time during the past two years. On the 1750-ft level the upraise to connect with the level above is making steady progress. The main drift on the main drift connecting with the C. & C. shaft are making good progress. Another crosscut, No. 3, has also been started on this level. On the 1650-ft level the main south-west drift is being rapidly enlarged to make a more convenient transit for the ore. On the 1400-ft level the ore continues to improve steadily and is of a very rich character. On the 1200-ft level the ore stopes continue a fine yield of rich ore. The yield of bullion for the month of November is amply sufficient to insure the payment of the regular monthly dividend of \$2 per share.

**CALIFORNIA.**—Daily yield, 650 tons of ore. The mills are kept steadily running on ore from the mine to their fullest capacities, everything working finely and the bullion returns being fully up to the usual rich standard. The ore stopes are yielding rich ore at almost every point. On the 1840-ft level the south drift is steadily advancing, the face still in that portion of the mine. On the 1750-ft level the north lateral drift and the east crosscuts from the same are being pushed vigorously forward, the ore prospects at almost every point continuing of the most favorable character. Sinking No. 3 winze east of the ore vein, below this level, is making very steady and favorable progress. On the same level the enlarging and timbering of the main connecting drift with the C. & C. shaft is going steadily forward. On the 1650-ft level the lateral drift from west crosscut No. 3 to connect with west crosscut No. 4 continues in good ore. The yield of bullion for the month of November will not fall much if any short of \$1,000,000, insuring the payment of the regular monthly dividend of \$2 per share.

**GRANITE.**—The south drift on the 1400-ft level is steadily advancing, this ore in the face of the drift showing a steady and favorable improvement. A station is being chambered out some distance south of the shaft on this level for the purpose of sinking a winze downward on the ore vein. On the 1200-ft level it is confidently expected that a connection will be made with the Caledonia to-day. This will give a desired opportunity for crosscutting the ore vein in that portion of the mine.

**SAVAGE.**—The water is being held at a point in the main incline a little above the 2100-ft level, until a large tank pit can be blasted out and a pump station put in 50 feet below the 2000-ft station. This is being done with all the expedition possible.

**NORTH CON. VIRGINIA.**—Sinking the main shaft has been resumed and is being pushed forward with all the energy possible. The shaft will soon have attained a sufficient depth to open the 1350-ft level. Preparations are shortly to be commenced for the erection of machinery with a sufficient power to prospect the mine to the depth of 3,000 feet or more.

**YELLOW JACKET.**—On the 2200-ft level the main drift east is in 570 feet, face in very hard material, consisting of porphyry and quartz. The drift north at the same level toward the Imperial is in 344 feet, face in quartz and porphyry, looking very favorable for ore. The new shaft is sinking in heavy ground and still requires double timbering or false sets to guard against pressure. During the month of November, 77 feet were added to the depth of the shaft, and its total depth at present is 1,022 feet.

**LAURELASMITH.**—On the 850-ft level the main drift east is being steadily advanced through very favorable looking ledge matter. Some hot water is seeping in at the face, indicating proximity to the ore vein. The drift south on this level, which corresponds with the 1000-ft level of the Justice, is also being actively pushed ahead and will connect with the Justice in about two months.

**GOULD & CURRY.**—The north drift on the 1000-ft level has reached the north line and is being pushed ahead by the Best & Belcher to prospect their mine or that level. A joint crosscut is being started on the Best & Belcher line to crosscut the vein at that point.

**BELCHER.**—The winze below the 1000-ft level is 175 feet deep to-day, and in good looking quartz, following the footwall of the ledge. On the 1900-ft level the main lateral drift south is in 500 feet, and shows good looking streaks of quartz and porphyry in its face. On the 2000-ft level the main drift east, after passing through a fine vein of quartz about 20 feet in width, has its face now in quartz and porphyry. The air shaft incline is now down 25 feet below the 2100-ft level, and the station timbers are put in for that level, the opening of which will be actively proceeded with as soon as practicable, drifting east to the vein and the following south.

**SILVER HILL.**—The expectation that the connection with the Justice mine, on the 600-ft level would be completed by the first of the week, but an actual survey showed a difference between the real measurement and the estimates of 36 feet, which it will take nearly the whole of the present week to overcome. Just as soon as this connection is completed and a current of air obtained, crosscutting the north line and the level will be commenced. Sinking the main incline is making excellent progress. The machinery is all in splendid working condition.

**MEXICAN.**—During the first part of the week the prospecting operations were all suspended on the 1465-ft level. The north drift on the 1000-ft level is steadily advancing, without any change of value whatever. Sinking the joint Olin winze and the Imperial is making steady progress. Preparations are being made to soon begin the development of the mine on the 1900-ft level.

**BEST & BELCHER.**—The southeast drift on the 1700-ft level is being steadily advanced without change. A joint crosscut is about being started on the south line, on the 1000-ft level, to prospect the ore vein at that point. The north drift on the 1000-ft level is being pushed ahead by the Best & Belcher to prospect their mine or that level. A joint crosscut is being started on the Best & Belcher line to crosscut the vein at that point.

**JULIA CON.**—Sinking the main incline below the 1800-ft level is making the best of progress, the bottom being still in a lively character of vein material, well filled with spots and streaks of good quartz. The face of the east crosscut from the east winze, on the 1800-ft level, is still in very favorable looking ground, showing streaks of fine quartz, which shows steady improvement as the drift advances.

**HALE & NORCROSS.**—The water has been steadily held in check during the week by the small pumps, at a point a short distance above the 2100-ft level, pending the putting in of a new pump station and pumps a little below the 2000-ft level.

**CALIFORNIA.**—The north drift on the 1600-ft level is steadily advancing, the face in very favorable ground. The east drift on this level is showing some lively quartz and excellent ore prospects. The prospecting drifts on the 1400-ft level are all being urged rapidly ahead, with more favorable prospects than for many months past.

**JUSTICE.**—What has been taken by the new management in the working of the mine remains to be seen, but it is confidently expected that ore to the amount perhaps of 200 tons per day can be extracted from the mine at a much less cost, and of a sufficiently high grade to pay not only the cost of milling, but a neat profit beside. In the meantime the developments on the lower levels are being advanced at every point, and new discoveries are being made. The main incline is making good progress and will soon be ready for the opening of a new station. The north and south winzes below the 800-ft level both continue in good ore. The south drift on this 1000-ft level is showing an improvement, and the southeast drift on the same level also shows a greater concentration of quartz and ore in the

face. The winze below the 1000-ft level continues in good ore and the south drift on the 1150-ft level is fast draining the water so that the prospecting operations can soon be extended in that direction, the ore body and vein at that point being much superior to what it is where it has been opened on the 1000-ft level.

**GRANITE.**—The work in the mine has been mostly confined during the week past to driving the southeast drift on the 1000-ft level, and the 1900-ft level, and preparing to put in the new pump lift at the 1900-ft station. The southeast drift continues in lively vein matter, east of the ore, and is now in a distance of 60 feet. Nothing is being done in the south drift from the incline at present. The change in the management will now open the way for a much more speedy development of the ore body by direct connection with the deep winze on the California line, which must greatly assist the ventilation and operating of both mines.

**BULLION.**—The south drift on the 1700-ft level is steadily advancing and has been showing an increase of quartz of a favorable character for the past two days. Sinking the combination winze to connect with the north drift on the 3000-ft level of the Imperial is making fair progress. The face of the north drift on the 2000-ft level is now in Bullion ground.

**CHOLLAR-POLOS.**—The east drift on the 1800-ft level running to connect with the Combination shaft is making the usual fair rate of progress. Sinking the Combination shaft is making the usual fair rate of progress.

**TRIMAX.**—The winze or incline being sunk below the 600-ft level is well started, being now 27 feet in depth, following the footwall of the vein and why under the vein itself. A station is cut only for the requisites bolting engine, which will be put in place by the time it is needed.

**CON. IMPERIAL.**—Sinking the south winze below the 2350-ft level is being pushed vigorously ahead and will soon reach the 2200-ft level of the Yellow Jacket, at which point it is the intention to connect the two mines for ventilating purposes.

**WARD.**—Sinking the shaft is being pushed forward with all the energy possible, the bottom being in very favorable ground. The flow of water gives little or no trouble.

**TROMAN.**—The ore resources of this mine are showing more extensive as further developed, both at the 350 and 240-ft levels. The ore body shows now 27 feet in width. The south crosscut on the 500-ft level the south cross drift is in 135 feet. The face continues in soft and very promising ledge matter.

**SUCCESS.**—Sinking the main shaft below the 900-ft level and also drifting for the ore vein at that level are both making good progress.

**ALPS.**—The erection of the new hoisting machinery is making good headway. The west crosscut on the 1150-ft level is being steadily pushed ahead to reach the ore vein on that level. The ore vein in the winze below this 1050-ft level continues of an excellent character.

**CROWS POINT.**—Daily yield 50 tons of ore, which is being crushed at the Rhode island mill as fast as extracted. The east drift on the 2000-ft level is being driven ahead at the rate of 50 feet per week. The quartz is running well, showing a slow but steady favorable improvements.

**SUTRO TUNNEL.**—The face of the header continues in easy working ledge matter, requiring constant timbering. No increase of water.

## CORNUCOPIA DISTRICT.

**DEVELOPMENTS.**—Cor. Silver State, Nov. 27: In addition to what I said of the Hussey in my last, I can now add that there is a continuous improvement in it all the time. They are now taking out all the ore which supplies the Leopold mill, and the mill is kept running all the time. Mr. Coffin returned from California day before yesterday, but has distributed no coin yet, and he appears very reticent, so no one can tell which way the Leopold intends to jump. They are keeping the usual number of men at work, which does not indicate a collapse there.

## ELY DISTRICT.

**THE CLEAR-UP.**—Pioche Record, Dec. 1: The Nevada Central train brought up on Monday, from Bullionville, \$0,000 in bullion, it being from the Alps company's mill there, and being the clean-up, as the company have moved their place of operations in milling to Condor canyon.

**ALPS & ELY.**—The work of sinking on the winze is still going on with good success and in dry ground. Prospecting is being carried on in the 1000-ft level, which looks encouraging. The other portions of the mine show encouraging prospects. Fifteen stamps of the mill will probably be started on ore on Monday, the other pans and settlers running on tailings.

**DAY JUMP.**—Everything going along nicely at this mine. Arriving the two trains along pretty fast, with indications very favorable of getting ore; in fact, have ore of a low grade in the lower tunnel.

**ALPS.**—The prospect of the Alps mine is encouraging. Quartz is coming into the face of the south drift and work is being pushed night and day. The company have taken possession of the new Condor mill and steam was gotten up yesterday. The side track and trestle from there, completed to-day, and the first train of ore will be sent to mill on Sunday, a large amount of first-class ore being on hand ready for shipment. The Superintendent says our people will see at an early day the flag unfurled at the hoisting works on the mountain, which will indicate that old Alps is again on a cash basis.

**GREAT EASTERN AND BAY STATE MINES.**—E. B. Dorsey left San Francisco on Wednesday for San Mateo, his object in going there being for the purpose of making arrangements to hire the 20-stamp mill of the Raymond & Ely company, to work the ores of the above mines. The ore from these mines average from \$45 to \$50 per ton, and, by getting them to Bullionville at a low price, they can be worked to an advantage. To get ore to Bullionville cheap from Bristol, they are proposed to make a trestle from there, by way of Stampede gap and Highland, direct to Bullionville. This will prevent the reshipping and rehandling of ore, which process is very expensive. Both the Great Eastern and Bay State mines will have the shafts in them straightened up and whims built for the purpose of taking out ore rapidly.

## EUREKA DISTRICT.

**NEW FURNACE.**—Eureka Sentinel, Dec. 2: The Eureka Consolidated company are constructing an additional furnace north of their reduction works. It will be built from plans drawn by Superintendent Donnelly, and will have some novel and interesting features never before included in smelting furnaces. Mr. Donnelly experimented some 18 months ago with a small furnace, his object being to prevent the large loss in dust that inevitably occurs in the smelting of ores as carried on at present, and demonstrated to his own and others' satisfaction that his theory was a correct one, the trial having been successful in every particular.

**BLANKET.**—The improved rotary blowers have arrived at the Eureka Con. works. One of the same kind of blowers has been in use some six weeks and gives perfect satisfaction. They will take the places of the old style blowers as soon as they can be placed in position.

The two pumps which arrived here several days ago, have been placed in position at the K. K. company's mine, and the latter are expected to arrive in a day or two, and when the four pumps are placed in position the Superintendent thinks they will keep the mine free from water.

## ROBERTS DISTRICT.

**THE MINES.**—Battle Mountain Messenger, Nov. 30: The Roberts district mines are situated 15 miles easterly from the Cortez mines, and about 35 miles southerly from Beowawe on the Central Pacific railroad. There are several mines in the district which promise well for large yields of paying ore. Gen. J. R. Williamson, of Austin, and Prof. Krom, of the Krom process notoriety, who visited the district last week, expressed themselves as highly pleased with prospects, and from what we can learn, Roberts district will soon be brought into note with the paying mines of Nevada. The ores are argilliferous and easily worked, and it is the opinion of Prof. Krom that it

## THE ENGINEER.

### The Improvement of the Mississippi.

Capt. Eads is lecturing upon a plan for the improvement of the Mississippi, which would render it navigable for large vessels as far as the mouth of the Ohio. In a recent lecture in Cincinnati, he said:

"Any system of levees which attempts to inclose these wide places in the river, will retain the fruitful cause of its own failure and entail untold cost for maintenance, because the levees are the cause of the rapid destruction of the banks, the crevasses and the cut-offs. They arrest the uniform and speedy passage of the floods to the sea, for at each one of them the current is retarded and the flood height elevated.

"I do not propose to grapple with the floods, but with the causes which produce them. Throughout the entire basin we see repeated illustrations of the fact that the greater the volume the lower the slope. Turn the waters of Red river down the Mississippi, by closing Atchafalaya, and we will increase the volume and reduce the slope. If it were reduced from the Passes to Red river only a quarter of an inch, it would lower the high-water mark nearly seven feet at Red river, and the same amount all the way up. It would then be steeper than it is for 100 miles below New Orleans. Outlets are precarious, and inevitably raise the flood line. The river should be brought to a uniformity of width, and where its volume is subdivided by islands, it should be confined to a single channel. I do not propose to shorten or straighten the river. Mature study has convinced me that no cut-offs will be needed to reduce the flood line below the level of the land. I once thought that one or two might be required. The treatment I propose is distinctly a high-water treatment. A uniformity of width of its banks will insure a uniformity of depth, and not less than 20 feet from Cairo to the sea in low water. A uniformity in width will bring a uniformity of current, which will more rapidly discharge the flood, and it will stop the caving of the banks.

"This plan is radically different from the plan of the United States Commission of Engineers. It is different in design, in the theory and in the assumption of existing conditions in the bed of the river. The Commission believes there exists in the bed of the river strata of 'hard blue clay of older formation,' which resists the action of the current 'almost like marble.' I believe the river made the bed it flows in from Cairo to the sea, and that the current can take from it and add to it with rapidity and ease wherever it is made quick or slow. The Commission does not believe there is any relation between the velocity of the current and the quantity of sediment carried in the water. I believe that every atom of sand or earth from the moment it enters the river until it is bathed by the salt waters of the Gulf, is controlled by laws as fixed and certain as those that rule the planets.

"In anticipated results these plans are immensely different. One contemplates the flood waters rising from 10 to 20 feet above the surface of the land between levees, which must involve an enormous and never-ending outlay for repairs and maintenance, with no improvement of the channel. The other, in effect, lifts above the floods forever an area equal to the States of Massachusetts, Vermont, Rhode Island, Connecticut and New Hampshire, and opens up 1,100 miles of navigation to the largest ocean shipping into the very heart of the Mississippi valley. It removes from the channel the snags that now infest it, prevents cut-offs and caving banks, and dispenses with the costly and uncertain system of levee protection, without imposing any important burden of maintenance upon the country."

Wonderful as these promises seem, there is little doubt in the minds of those who have intelligently studied the action of the currents in rivers flowing through alluvial soils, that the results mentioned can be attained and 20 feet of water carried from New Orleans to the Ohio.

### The Water Supply of London.

Now that we are talking freely of expending millions of dollars for water rights, etc., for our city, it will be in order to contrast our amounts with those required to supply London: One of the best papers read at a late meeting of the British Scientific Association, was that on the London water supply, by Messrs. Bramwell and Easton who have made a special study of the subject. In June of this year the population supplied by the eight London water companies was nearly 4,000,000, living in over half a million houses, and this at a gross expense of over \$6,000,000, yielding a net profit at a little over 6% on the capital of \$50,000,000 and over. The mere value of the property in London protected by water supply from fire is roughly estimated at \$8,000,000,000, and about a fourth of this only is covered by insurance. Small in importance as this is as compared to the other requirements of a good water supply, even the modest demands of the London fire department are not met. Although, on an average, the fires of a whole year do not consume the ordinary supply of one day for other purposes, still there should be the means of concentrating at any given point about 3,000,000 gallons in the 24 hours, or one-fortieth of the entire London supply. Manchester and Liverpool have learned

by hard experience the necessity of securing not only abundant supply of water for fire purposes, but such pressure as will give head enough to apply the water directly to fires without engine; in London not more than 40 feet can thus be got, and yet the engineers say that it must be doubled to do any real benefit.

For \$20,000,000 to \$30,000,000 it is estimated that London could be supplied with enough good drinking water to keep the population healthy, and with water under sufficient pressure for extinguishing fires. That in this respect London is economical is shown by the following figures: To protect the \$8,000,000,000 of property, there is raised and spent by the Fire Department a little less than \$500,000, and this is distributed between tax-payers, the insurance companies which pay about \$200 for each \$5,000,000 insured, and the government. Now all this makes an average of \$100 per 1,000 of its population, while Paris spends at the rate of \$250, and New York more than ten times the sum spent in London, and Chicago is not very far behind New York.

### A Novel Method of Draining a Lake.

The process of draining off a lake 200 morgen in extent by means of a bricked shaft is being watched with much interest in Ramsau. We read in a foreign exchange that the shaft is 600 meters in length, and in the form of an ellipse with a major axis of 1.85, and a minor axis of 1.08 meters, and has an incline of 1 in 1,000. From the outflow end of the shaft the water

CURIOUS RESULT OF COMPLEX GRAFTING.

will pass through some meadows by an old channel into another lake, whence it finds a natural exit. The ordinary methods of conducting away water in the district are by open canals or by drain pipes, but a shaft was chosen in this instance as being the more economical procedure, independent of its other advantages. The line of direction runs under a ridge of high ground 27½ meters above the level of the base of the shaft. The cost of carrying off the water by drain-pipes was estimated at 126,000 marks (£6,300). The shaft on the other hand, inclusive of bricks, labor, lime, cement, etc., cost only 25 marks per meter run, or 15,000 marks (£750) in all, to which is added a sum of 2,000 marks for the traveling expenses and services of an official inspector. As each meter of earth is cut out by the hewers, the brickwork of the shaft is pushed forward by workmen in waiting at the rate of from one and a half to two and a half meters per day. About 170 meters are now built, and the completion of the shaft may be expected about June next. Besides its moderate initial cost, the method of drainage by shaft has the recommendation of great durability, works of a similar nature in Silesia having required no repairs whatever for a period of more than 50 years. No land whatever is lost either temporarily or permanently in constructing the shaft, as would be the case if drainage pipes or an open cutting were employed, and the 200 morgen of rich land reclaimed by the undertaking will richly repay its comparatively trifling cost.

TRANSCONTINENTAL SURVEY.—The Hagerstown (Md.) Mail says that Mr. Edwin Smith, of the United States coast-survey service, detailed to make a survey of levels from the

Atlantic to the Pacific, has commenced operations, making the court-house, Hagerstown, the initial point of his survey. It was the original design to follow up the National turnpike in this survey, and it was with this view that Hagerstown was selected as the base of operations; but owing to the hilly character of the country this route was changed, and Mr. Smith has determined to run his line to Williamsport, and thence along the tow-path of the canal to Cumberland. This division of his work he expects to finish this winter, and then he will carry it on to Cincinnati, St. Louis, and westward by the Kansas Pacific railway. On its completion to San Francisco it is designed to return to the initial point and then to the Atlantic, either by the way of Harrisburg and Philadelphia to tide-water, or by the way of Harper's Ferry to Washington. The work will involve several years' labor.

### Steam Cultivation.

The telegraph announces that Congressman Horace Davis, of San Francisco, has introduced a bill at Washington allowing the importation of tackle, etc., for steam cultivation free of duties for the coming two years. Although we have no fuller information of Mr. Davis' measure other than the mere statement of the above fact, we imagine that the removal of duty will be advocated on the ground that experiment of steam cultivation is one very desirable to make

most desirable. It would induce new strength in our soil and new spirit in our cultivators, and would be just the stimulus which our producers need now that new fields in India and elsewhere are being brought into competition with them in the production of breadstuffs.

As the subject is up for discussion we have taken from this week's receipts of English exchanges two paragraphs; one giving the experience of a practical farmer from his own work, and the other the general deduction of an agricultural writer from a wider range of experience. A Bedfordshire farmer, in a letter to the London Times, says: "Within a distance of four miles from where I am writing, there were six sets of Fowler's double-engine tackle at work on Wednesday. Neither is it necessary for farms to increase in size, in order that industry, capital and steam may be applied to the land. I myself occupy barely 300 acres, and yet I have the pleasure of seeing the rubbish torn from the ground by the steam cultivators. I entered upon the farm, which had been much neglected, two years ago, and but for steam I know not what I should have done."

The advantages of steam work when the soil is too hard and dry for horse plowing commend themselves most forcibly to our farmers. We quote from the *Agricultural Economist* concerning the present season in England: "The possessors of steam tackle have certainly had a good time of it, while many farmers have had to submit to the annoyance of seeing their horses idle so far as the breaking of land was concerned. We do not remember an autumn which has been so favorable for clearing land, where the power has been equal to the work. An owner of one of Howard's farmer's engines and tackle told us the other day that nothing could have given him greater satisfaction than the work he had been able to accomplish this season, while all around him his neighbors had been compelled to suspend plowing because of the dry, hard condition of the soil. Nothing can prove such a practical argument in favor of steam power properly applied as a walk over a farm under steam cultivation at this time. Steam has enabled farmers to take time by the forelock, and to utilize the hard, dry weather by breaking stubbles and going on with all necessary operations, and thus doing away with all grass and weeds; while farms under the ordinary plow are only partially and imperfectly cleared, and must remain an eyesore to the occupiers until the spring is far advanced."

Is not this a deduction from experience with steam plowing which is of sharp application to our general conditions? It would give us the mastery of the soil at a season when there is abundant time to work it, and it would leave it in such condition that the earliest of the fall rains could sink deep and deposit themselves for the future needs of the plant. Under conditions which do not favor dry sowing, the advantage would be almost as great, for if the soil were thoroughly stirred beforehand, a very slight cultivation would prepare the seed bed for later sowing. The advantage of plowing the summer-fallow, even in spite of the difficulty with which it is now accomplished, is generally recognized. It would be directly productive of profit, then, if the engines, when not driving the threshers, could be kept employed in working the fallow as well as plowing for direct seeding.

We hope that a thorough and careful test of steam cultivating machinery will be made, both in its effect upon soils which have been long cropped under the old system, and in the matter of comparative expense of doing the work and other matters relating thereto. We should not pass untried progressive ideas which are demonstrating their value elsewhere.

### A Peculiar Graft.

Quite a curiosity in grafting may be seen on Mr. Lewelling's place in Alameda county. By studying the engraving on this page the complications of these grafts may be seen. This graft blends into one tree five varieties of the apple. The four base stocks were originally four independent trees, standing at the angles of a square, about four feet apart. The tops of these were inclined to each other, and united in a complex graft, after which interlacing branches were united by graft at each point of contact, forming, as it were, a perfect framework for an aboriginal wigwam. Upon the top, at the apex of this growing structure, another graft was set, which has grown to be a large bearing tree.

This skillful warping of nature was executed 15 years ago, by Mr. J. Lewelling, and is, perhaps, the most perfect specimen of complex grafting on this coast. It is quite a curiosity.—*Pacific Rural Press*.

ELIXIR EUCALYPTUS.—The following formula has been recommended, for which we are indebted to *New Remedies*:

Eucalypts leaves.....	4 troy oz.
Alcohol, 85%.....	q. s.
Oil or orange.....	2 drachms.
Oil cinnamon (Ceylon).....	2 drachms.
Sugar.....	12 ounces.

Reduce the eucalypts leaves to a coarse powder, add the oils to 1½ pints of alcohol, moisten the leaves with a portion of this menstruum, and pack it in a percolating funnel. Pour on the remainder of the alcohol and percolate 1½ pints of tincture, using, if necessary, an additional quantity of 85% alcohol. Add the sugar to the mixture and make the product measure two pints by adding more alcohol.

Continued from Page 354

Newville, the farthest north, Elk Creek and Leesville, the last at the head of Bear valley—all centers of the local trade of their respective vicinities.

This is the region of mineral springs—sign boards may be seen pointing to Bartlett's, Cook's, Anderson's, and others.

#### The Wilbur Hot Sulphur Springs,

Being but a short drive from the lower end of Bear valley, a taste of this water and the luxury of a bath were soon enjoyed. They are within about 25 miles from the terminus of the Northern railroad at Williams, and have been a resort for invalids for the past 17 years. An analysis of the waters shows that they contain both sulphuretted and muriate of potash, soda, iron, alumina, together with sulphuric and muriatic acid, so that they have become celebrated, in particular, for the cure of some of the worst cases of rheumatism and dropsy. They are found excellent for salt rheum, tetter, and all other cutaneous diseases, and said to seldom fail in giving relief to those suffering from neuralgia, liver complaint, dyspepsia, and numerous other kindred diseases. The temperature of the principal spring is 145° Fahrenheit, although there are four other kinds of water, including one spring of sulphur and iron (cold), and one of cold soft water. The air is pure, the surroundings delightful, and all things about the establishment, inclusive of mud bath for rheumatic patients, have been carefully fitted up by Mr. Brame, the accommodating proprietor, both for the convenience and comfort of his guests. A visit to the springs is one among the many pleasant reminiscences connected with our wanderings around the county. K.

#### "Expensive Plodding."

EDITORS PRESS:—An article under the above head, in your issue of November 24th, favors, a discussion and looks to the State University as a desirable teacher to practical millmen, to-wit: The proper drop for stamps in quartz-mills.

Now, education is to be desired and respected at all times, but there are different kinds and different methods of obtaining it.

It does not reflect in the least upon the learned man who has followed a thorough course of preparatory book knowledge by practical experience in metallurgy, to say that in some details he has no advantage over workers who are life students in their business.

There is a class of men to-day that have worked thousands of tons of ore of varying qualities in numerous differing mills.

Some of these men may or may not have started to earn their bread with only a common school education, but are untiring students of their business, well read and thoroughly informed of progress in their line. They are not to be compared with such petrified disciples of the antiquated methods of the old world, as the previous article refers to.

It is they who have quickened the speed of stamps, and it is in their knowledge that the amount of drop for a fast stamp is proscribed because of time for fall.

One of them would not run a mill 24 hours without knowing whether the battery was working with economy.

These are the men from whom mill builders must take their cue, the experience of one supported by the mechanical abilities of the other. Thus has milling been made what it is to-day.

Let the State University make experiments; the results would receive all credit due, but it would be like a flouring miller teaching a man who had ground a handful of wheat in a coffee-mill.

A discussion might enlighten or bewilder some who lacked enterprising experience.

M. P. B.

**WORK AND PLAY.**—Dr. John Strachan, of Edinburgh, has recently published a valuable little treatise, physiologically inquiring into the bearing of play upon education and training; and after some preliminary remarks he proceeds to state that the law of spontaneous development through play does not end with physical improvement, but that, after a time the higher and more differentiated faculties come to be required for the perfection of the animal, and that the same law presides over their evolution. Play, he explains, that is apparently aimless, or, at least, not consciously directed exercise, is the means of securing the equable development of the brain and its faculties—memory, imagination, hope, wonder, and even special kinds of intellectual and moral activity, according to the endowments, and perhaps also the accidents of social position in the individual. "Exercise is accompanied by pleasure up to the limit of fatigue; beyond this limit, by pain or uneasiness. Special endowments or faculties brought into prominence by accident and after exercised are more, others are less, developed. But in every case there is a limit, and the only sure way of ascertaining the limit is by giving scope to the instinct; in other words, by allowing 'play' or apparently unregulated spontaneous impulse its due place in the work of education."

The money spent in our late election would pay the salaries of all those elected. Moral—draw it yourself.

## USEFUL INFORMATION.

### The Electric Light and Its Cost.

Nature announces that a special division of the Paris International Exhibition will be devoted to electricity, so that all the systems of electric lighting may be tested comparatively. The electric light continues to create the greatest interest in Paris. The experiments which we mentioned some time ago have been conducted during 40 consecutive days at the Lyons railway station. A force of about 40 horse-power is sufficient to keep going 28 electric lamps, each of which gives a light equal to 80 gas lamps, and works with regularity for 10½ hours. The effect is splendid, the whole of this station, except the waiting room, being lighted a *giorno*. The question of economy, however, is not yet settled. It is not known whether the company will agree to pay a somewhat higher price in order to multiply the power of its illumination. These experiments have been tried on Lontain's system, a modification of Wilde's and Siemens' principle. M. Lontain has contrived to send the current generated by an ordinary Wilde's machine into an electro-magnetic engine called a distributor. The central part being strongly magnetized by the current from a Wilde's machine, a number of electro-magnets are influenced by its rapid rotation, and in each of these an induction-current is generated. These induction-currents are powerful enough to feed three electric lamps, and as there are two series of 12 magnets a single machine could, theoretically, feed 72 lamps. Actually, however, it feeds only 28. Lontain uses a new regulator, which works very well by the dilatation of a small silver wire. By its dilatation this part of the apparatus works a lever system, and brings the carbon electrodes into contact. The French Northern railway has purchased a number of Gramme magneto-electric machines. They intend to use them at their terminus goods and stores.

The New York Tribune, looking toward the application of the electric light in this country, says: It appears to be difficult to arrive at the cost of using the electric light, figures of estimate in different experiments varying considerably. In many manufacturing establishments the cost of the power to drive a magneto-electric machine would scarcely be felt, as only two or three horse-power, at the most, would be required. The cost of the carbons is said to be less than five cents per hour per lamp, on the Jablohoff plan; another estimate is about twice as much, but perhaps refers to two lamps instead of one. An electric light which does not, according to accounts, appear to be constructed on the Jablohoff plan, tested in practical service at LaChapelle, France, costs, including motive power for the machine, about 12 cents per lamp per hour. Machines capable of running three lamps, cost less than \$500, and perhaps that sum could be made to cover all the first outlay. The wear and tear of the machine is not estimated. A careful study of the figures thus far furnished, leads to the belief that light can be furnished by electricity, in France, at about two-fifths the cost of gas; and as the price of gas in most American cities exceeds the price in Europe, it seems probable that a similar estimate of the comparative cost of electric illumination for this country would fairly apply.

### Treaty about Trade Marks.

A treaty has just been signed, says the *Iron Age*, by Mr. Pierrepont, our Minister to England, and the Earl of Derby, giving mutual protection to citizens in both countries against the pirating of trade marks. Each nation has its own stringent law applicable to its own people, but these statutes have done little to stop the mischief so long as they have no effect on foreign offenders. Our trade mark law, of Congress last year, makes punishable the imitation of trade marks, or dealing in trade mark goods, or selling or keeping empty packages bearing trade marks with intent to defraud. This law puts a stop to this vilest of the tricks in trade. The treaty just signed gives the same security in England. Under this convention it will only be necessary for Americans and Englishmen to register their trade marks in each other's country, paying the small fees required, and they will have all the protection which any law can give them. The operation of the treaty will be doubly beneficial to Americans, guarding consumers here against impositions from the sale of spurious products with counterfeited British trade marks, and preventing the sale of bogus American goods in British markets, by which the reputation of our manufactures and our export business are damaged. The adoption of this treaty should lead to similar agreements between the United States and other countries where these commercial villainies are tolerated.

**IMPROVED CARMINE INK.**—The *English Mechanic* says: The solubility of carmine lake in caustic aqua ammonia is attended with this disadvantage: that in consequence of the alkaline properties of ammonia, the cochineal pigment will, in time, form a basic compound, which in contact with a steel pen no longer produces the intense red, but rather a blackish color. To avoid this evil, prepare the ink as follows: Saturate 1 gramme of pure carmine with 15 grammes of acetate of ammonia solution and an equal quantity of distilled water in a porcelain mortar, and allow the whole to stand for some

time. In this way a portion of the alumina which is combined with the carmine dye, is taken up by the acetic acid of the ammonia salt, and separates as precipitate, while the pure pigment of the cochineal remains dissolved in half saturated ammonia. It is now filtered, and a few drops of pure white syrup added to thicken it. In this way an excellent red drawing ink is obtained, which holds its color for a long time. A solution of gum arabic cannot be employed to thicken this ink, as it still contains some acetic acid, which would coagulate the bassorine which is one of the natural constituents of gum arabic.

**PATENT BUSINESS OF THE WORLD.**—The following abstract in the London *Mining Journal*, prepared from the official records, shows the remarkable increase of patent business in the principal countries of the world during the past 30 years. The figures first in order for each country refer to the patents granted in year 1846, and the second figures refer to the year 1876:—Great Britain, 493, 3,435; Canada, 38, 1,252; Austria, 406 (in 1853), 1,294; Baden, 9, 187; Bavaria, 112, 217; Belgium, averaged, 400, 2,657; France, 2,750, 5,734; Italy, 224 (in 1855), 538; Prussia, 55, 461; Saxony, 31, 483; Sweden and Norway, 58, 293; United States of America, 619, 17,026; Wurtemberg, 8, 256. Russian patent business has been almost stationary during the 30 years, the official list in no case having been more than 100 patents. Thus the total patents in the above countries for the years first quoted were 5,303, as against 33,938 in the year 1876. It may be explained, however, that the 33,938 patents do not represent an equal number of inventions, as many of the better class of inventions are patented in several countries simultaneously.

**CAUSE OF MILL FIRES.**—A correspondent of the London (England) *Mirror* writes as follows concerning fires in flour mills: "I have been for more than 30 years connected with the trade, and in that time it has been my misfortune to be once burned out of a situation. I have also seen and know many mill fires, the majority of which have taken place in the night, and most of those after the mills have shut down several hours, many of them breaking out of a Sunday morning, and even as late as the evening, or after midnight—in other words, on Monday morning. The cause of the long interval I attribute to the smoldering of dust around some hot bearing till it has assumed a body of fire and charred wood, when a slight draught has produced a flame, and before being noticed was spread too far to be stopped till the mill and its contents have been reduced to a heap of ruins. In most cases this might have been prevented by it being made the duty of one man to go round and look to all bearings before locking up the place for the night."

**A COLD YEAR.**—As a cold year in California means a wet year, readers will be glad to know that Prof. Piazza Smith, by observations of the waves of temperature for the past forty years, predicts that the coming winter will be more than usually cold, to be followed by a remarkably warm period, beginning about the middle of 1879.

## GOOD HEALTH.

### Poison Oak and Its Antidotes.

EDITORS PRESS:—As most of us know, "poison oak" is the cause of a vast deal of misery and suffering in California. There is scarcely ever a time, in any little town or neighborhood, when there are not one or more persons suffering from it, and it has been estimated that there are in this State near 3,000 persons constantly afflicted with the cutaneous disease caused by this dreaded scourge.

Many and various have been the "remedies" with which our local practitioners have endeavored to combat the effects of the universally dreaded poison oak. When I mention a few, such as lotions and ointments of lead, bismuth and opium compounds, applications of hartshorn and various alkaline salts in every variety of combination, it will be seen that not only is this scourge of wide prevalence, but of deep practical interest to the physician and pharmacist, for every medical practitioner meets with more or less cases of it in his daily rounds.

The many remedies which have been used for counteracting the effects of poison oak all give way in efficiency and celerity to the *Grindelia robusta*. This, like the *Rhus toxicodendron*, is indigenous to the State and found in many parts, but grows most luxuriantly in the foothills of the Sierra Nevada and Coast Range of mountains.

*Grindelia robusta* is a tall, stout perennial, belongs to the Composite family, and looks like a small sunflower. It is from one to three feet in height, and has bright yellow flowers in beads, one or two inches in diameter, flowering from June to October. Before flowering the unexpanded heads or petals secrete a quantity of resinous matter, white and sticky, like balsam, that is finally, after the flower expands, distributed like varnish over the petals of the flower. The whole plant, at this season, flow-

ers and leaves, is resinous and viscid. When it grows in dry hills it is stiff and rigid with narrow thin leaves; but in damp localities it is more robust and succulent, with wide fleshy leaves. May and June are the months in which the *Grindelia* should be gathered for use, as at that time the plant abounds most in the balsamic and resinous juice in which its medicinal properties reside, and causes its marvelous effect in the cure of this eruption from oak poisoning, for which purpose it has been used with good effect since the occupation of the country by the Americans.

Dr. C. A. Canfield (deceased), of Monterey, Cal., was the first to call the attention of the medical profession to the therapeutic action of *Grindelia robusta* in cases of "poison oak."

I have experimented in different ways to obtain a "fluid extract" which should fully represent the medicinal virtues of the leaves and flowering tops of the plant. The fluid extract, which is the most concentrated form of preparation used, contains in one pint the strength of 16 troy ounces of the drug, and is made by the following process: A sufficient quantity of the carefully picked leaves and tops of the *Grindelia* are put into a suitable vessel and nearly covered with a mixture of one part of water to two of alcohol, allowed to macerate for 24 hours, a strong cover being laid over and pressed down with appropriate weights. At the expiration of this time the whole is transferred to a percolator with a stop cock attached; and after remaining for five or six hours, the resulting liquid is drawn off and the residue in the percolator taken, transferred to strong bags, and submitted to the action of a powerful press. The liquid from this is now mixed with that from the percolator and set aside. It is generally requisite to repeat the process with one half the amount of menstruum, and the results being mixed together should measure one pint for every 16 troy ounces of the drug employed. In case, however, the full measure is not obtained, enough alcohol is added to supply the deficiency, and the whole rapidly filtered and transferred to well-stoppered bottles. This process gives a clear, thin, nice-looking fluid extract, with a pleasant odor and characteristic aromatic taste, and which can be kept for a long time with usual precautions without any deposit. It may be presumed that the medicinal virtues of the *Grindelia robusta* reside in the viscid and resinous juice before mentioned. Confirmatory evidence offers itself in the fact that the plants gathered from the lower and marshy grounds are more robust and succulent, the leaves and stalks larger and coarser in appearance and devoid almost entirely of the "balsam" before mentioned, and has little efficacy in the eruption of poison oak. The directions are as follows:

For poison oak eruption, the best method is to mix one or two teaspoonfuls of the strong fluid extract of *Grindelia* with half a tumbler of cold or tepid water, and apply freely with a sponge or cloths dipped in the mixture to the parts affected. One or two applications will often suffice for a cure, but if the disease has been of long duration, several days may elapse before entire relief is obtained. In severe cases of poisoning, cloths dipped in the solution may be bound upon the parts, and, if necessary, more of the fluid extract added. The most obstinate case of poisoning will be overcome by this mode of treatment, and immediately after the first application the most surprising relief is experienced. JAMES G. STEELE.

San Francisco, September, 1877.

**TATTOOING A CONTAGIOUS DISEASE.**—One of the most curious cases of spreading a disease of offensive and contagious character has lately been brought to light by Dr. Maury, of the Philadelphia hospital. The *Polytechnic Review* says: Attention was attracted to the case some time ago by the large number of persons who were admitted to the hospital suffering from this disease, and who had been inoculated with it through the process of tattooing. Shortly thereafter it was ascertained that at Reading, Pa., some 200 or 300 persons had been similarly inoculated, and that it was the work of a notorious vagabond, who practiced tattooing as a trade. Through the efforts of the police authorities this person was shortly thereafter arrested at the instance of the health officers of the two cities. Medical examination revealed the fact that he was afflicted with the disease, and it transpired that in performing the operation of tattooing, he was in the habit of moistening his needles, before charging with paint, by placing them in his mouth, which was filled with sores.

**EATING ORANGES.**—A vast number of oranges are eaten by the Spaniards, it being no uncommon thing for the children of a family to consume ten or a dozen oranges each before breakfast, gathering them from the orange groves, where they hang like the veritable golden fruit, which they are metaphorically supposed to be. Such wholesale consumption of what we look upon as a luxury appears to have no ill effect. The testimony of a late eminent physician authorizes the use of fruit as most wholesome immediately upon waking in the morning; he in fact, prescribed such a regimen to a friend as the only invigorating and permanent cure for indigestion, facetiously remarking that he gave her a piece of advice which, if it were known to his dyspeptic patients, would cost him his practice, as they might prefer so simple a remedy to his professional visits.—*London Gardeners' Chronicle*.

## NEW ADVERTISEMENTS.

Mining Laws and Decisions; Assessment Notices—Timmy Chu Mining Co.; Manzanita Gold Mining Co.; New Basel Consolidated Gravel Mining Co.; The Welch Consolidated Q. S. M. Co.

## The Week.

The event of the week in mining circles has been the change in control of several of the largest mines on the Comstock. Ophir and Mexican have both passed into the control of Flood & O'Brien, and that firm now own about a mile in one piece on the ledge besides what they own on the south end. They now control Hale & Norcross, Savage, Gould & Curry, Best & Belcher, Consolidated Virginia, California, Ophir and Mexican, aggregating 4,930 feet, divided into 1,721,600 shares. The value of these properties on Wednesday, in the aggregate, were \$43,012,800. Jas. G. Fair now superintends these properties, the larger portion of the properties being owned by the bonanza firm.

In the Justice mine also a change has been made. The new trustees are E. J. Baldwin, Archie Borland, R. H. Lloyd, A. K. P. Harmon and C. L. Weller. Samuel Curtis, late of the Ophir mine, was nominated for Superintendent, in place of E. A. Schultz. This action was opposed by Messrs. Harmon and Weller, who were prominent officers of the Ophir company at the time of Mr. Curtis' dismissal from that mine. It was contended by the other members that Mr. Curtis possessed a knowledge of mining that made him a valuable acquisition, and it was the intention of the Board to do away with the loose manner of conducting business common to the mining companies, by which the superintendents are given power to make contracts and handle the property of the companies at the mines without proper supervision of the directors. It was stated that the intention of the new Board was to advertise for all proposals for supplies, etc., make the awards, and discharge their duties fully and as economically as possible. Mr. Curtis was thereupon elected Superintendent, notwithstanding the opposition of Messrs. Harmon and Weller, and resulted in the two last named gentlemen handing in their resignations as members of the Board.

## Profits of Mining.

The various mines listed on the San Francisco Stock Board have in the aggregate, levied assessments amounting to \$55,578,103 and have paid dividends amounting to \$110,044,199. It will be noticed that the dividends are almost double the assessments and yet some people say mining does not pay. Mining in stocks does not always pay by a good deal, but mining in mines is a different thing altogether. It must be remembered, also, that many of the mines listed on the board were never expected to pay or intended for anything else than means of levying assessments or disposing of stock. Everybody who has ever had anything much to do with the stock market understand why this class of mines exist and knows also that if they had not been taken into account the assessments would have shown a much smaller figure, although the dividends would not have been increased.

Moreover, it must be recollected that these are only an extremely small proportion of the many mines on this coast, and of those not listed on the boards very little is known as far as yield is concerned. There are hundreds of mines in every direction which are paying well, which make no showing in the above figures. For instance, we mention elsewhere in this issue the fact of the Idaho mine of Grass Valley, paying its one hundredth dividend this month, but it is a private corporation and the stock is not dealt in on the boards.

When one comes to think of it the figures given above show results which are not to be found in many kinds of business. A return of 100% on such large amounts is seldom found. The mines in question are mainly located in Nevada, very few California mines being enrolled on the boards. In fact the California mines on the boards are so few that of the total amounts they have only levied \$1,094,100 in assessments and paid \$2,583,500 in dividends. Washoe leads the list with \$100,020,700 dividends and \$44,808,182 in assessments; White Pine assessed us \$1,550,561, and only returned \$31,999; Ely district levied assessments amounting to \$2,031,000 and paid a return of \$4,432,500; Tuscarora and Cornucopia levied \$388,000 in assessments, for which they have only so far returned \$262,500; miscellaneous Nevada mines have levied \$2,380,250 in assessments, and returned for this expenditure \$2,135,000 in dividends. Idaho mines treated their investors badly, having drawn out in the form of assessments \$3,426,000 and returned as dividends only \$575,000. In the last case, however, it was no doubt more the fault of the management than of the mines.

It is well to call the attention of the public to facts like these occasionally, so that they will appreciate the value of the mining interests of the country in proportion to their value.

## The Legislature of 1877-8.

On Monday the members of the two houses of the California Legislature of 1877-8 assembled at the Capitol in Sacramento and effected a preliminary organization. On Tuesday the final steps were taken and the Legislature declared ready for business. The Senate elected Hon. E. J. Lewis, of Tehama, President *pro tem.*, Rufus Shoemaker, of Nevada, Secretary; P. H. Dunn and Geo. Seckle, Assistant Secretaries; Wm. H. Bell, Sergeant-at-Arms, S. S. Ford, Assistant Sergeant-at-Arms; Newton Benedict, Minute Clerk; George Corbie, Journal Clerk; George W. Greene, Enrolling Clerk; Michael Mitchell, Engrossing Clerk; A. L. Edwards, Jr., Postmaster.

The Assembly elected Hon. C. P. Berry, of Sutter county, Speaker, who made an appropriate speech upon taking the chair. Hon. J. E. Murphy, of Del Norte, was chosen Speaker *pro tem.*; Robert Page, Chief Clerk. As we go to press the minds of the legislators are occupied with the choice of a U. S. Senator.

The following is a complete list of the members of the Legislature and the districts they represent. All readers should preserve it for reference, as we propose to make frequent allusions to the topics brought before the law-making bodies this winter:

## Senators.

The (\*) asterisk signifies that the Senator is a hold over—all the others are newly elected:  
First District—San Diego and San Bernardino—J. W. Satterwhite, D.\*  
Second District—Los Angeles—George H. Smith, D.  
Third District—Ventura, Santa Barbara and San Luis Obispo—P. W. Murphy, D.  
Fourth District—Fresno, Tulare, Kern, Mono and Inyo—Thomas Fowler, D.  
Fifth District—Mariposa, Merced and Stanislaus—John M. Montgomery, D.\*  
Sixth District—Monterey, San Benito and Santa Cruz—Thomas Flint, R.\*  
Seventh District—Santa Clara—W. Z. Angney, D.\*; D. E. Murphy, D.

## Patent Your Mines.

The importance of patenting the mines cannot be too frequently impressed on the mining community. Every man who finds a ledge looks forward with bright hopes to its future, and is assured that success will reward his labors. When it does it seems too bad to have a defective title prevent a sale. A United States patent is a guarantee that no one can come in with a conflicting title after the patent is granted; and people will not buy mines now-a-days unless they are sure of this. The avoidance of litigation with mining property is worth looking after, and when the title is once vested in the proper owner by means of a patent, that is the end of any legal proceedings.

A doubt regarding ownership is a worse thing to contend with in negotiating for mining property than a doubt as to the value of the mine itself. When a man buys a mine he is not compelled to spend more than he wants to and can stop when he likes; but in a law suit he is not a free agent. Therefore, if miners intend selling their claims or getting capitalists to aid them the first step after getting the claim is to get the patent. Moreover, by procuring a patent the miner is released from annual expenditure, and the cost of the patent is no more than a few years' necessary annual expenditure. Once the mine is patented it can lie idle until the owner is ready to work it, as the title then rests in him and no longer on the Government.

Much trouble and expense can be prevented by getting a patent and it is much less expense than many suppose. The proprietors of this journal have made arrangements by which they take charge of the application and the whole business of obtaining a patent for mining ground, with no trouble to the applicant and at very moderate expense. Any information on the subject will be cheerfully given on application.

## Labor Rights and Wrongs.

The events of Thanksgiving Day in this city proved that the laboring men had learned a lesson which will be of infinite benefit to them. The fact was that at least 7,500 of them paraded the streets of the city with their bands of music, and banners flying; afterward assembled around a speakers' stand and listened to speeches delivered in their interest, and, finally, went to their homes without disturbing the public peace, thus proving their respect for the law and their conformity to constituted authority. By thus conducting themselves they can claim for themselves the respectful attention of their fellow citizens, and however one may disagree with them as to the wisdom and justice of their claims, all will agree in regarding them as true men and good citizens. To them belongs, of course, the right of public assemblage and honest discussion of wrongs either true or fancied. Theirs is the privilege of protest and petition. Theirs is the ballot to use it honestly as they may. Theirs is the opportunity to present their views for public consideration and to win the support of those to whom the views commend themselves. As all these rights were exercised or insisted upon in an orderly manner, the so-called workmen's organizations lift themselves from the mire of a mob, into which their leaders at one time seemed disposed to drag them, and they become lawful assemblages entitled to respect and protection. We are glad for the sake of the laboring men that such has been the character of their demonstration. It promises well for the true solution of questions which vex them, questions which, while they were accompanied by threats of violence and tumult, could not be considered for a moment by law-abiding citizens.

There are certain things which the laboring men can do, and certain things which they cannot do. They desire a greater share of this world's goods. They cannot secure it by any wild communistic scheme for division of property. It may be that there have been large fortunes built up dishonestly. No arm but that of the law can lay hand upon them. They are of rare occurrence. By far the greater part of those men who have accumulated property have done it by those practices of self-denial, enterprise and industry which are the only royal avenues to competence. What a man has accumulated in this way, no one else has any more right to touch than he has to pull the hair from his head. It is his own by every right, human and divine. It is the result of the consumption of tired muscles and weary brain. You may pursue the same course as he but have no right to lay hold upon his garments nor clog his steps. But though there can be no tolerance for this wild and fanatical idea, which is put forth in the name of labor and yet has not an element of labor in it, there are doubtless reforms which are needed and which, when secured, will remove the barriers which make the course to comfort and competence harder to some classes than to others. These reforms it is plainly in the scope and design of the law to secure. And these it is wise to discuss, to vote for and to impress upon the attention of law makers.

We think the laboring men will find that they have the sympathy of all well disposed citizens in their honest efforts to better their condition and to improve themselves. But they must be wise and patient. Some of the things they cry loudest for are among the impossibilities, so far as immediate and general accomplishment are concerned. It is quite right that they should be awake and enterprising to secure for themselves the profitable labor men have to dispense, but they must guard against assuming the role of dictators. Sweeping changes are always dangerous to industries and men will not make them. As it now appears it is simply impossible to carry on some productive enterprises at the wages which the available white laborers demand. At the present low rates the enterprises just maintain themselves. The disposition is good enough on the part of many employers of labor, but their business will not yield enough to meet any higher wages than they are now paying.

However this may be, and whatever desirable reforms the working men may be able to secure by their organization, they must all remember one thing and that is that no amount of organization can take the place of individual industry and devotion to the plain work of making a living. They may send men from their own ranks to occupy seats in the future legislatures at Sacramento; they may secure the city officers to a certain extent, but this will not lift from any of them the need of personal and persistent labor. There are few men who escape labor and they generally lose the good opinion of their fellow men with it. Whatever a society may do, it still leaves the individual member to carve out his own fortune; and our caution, to those who may be expecting great things as the result of their combination, is that the measure of success which they meet in obtaining for themselves the profitable labor of this coast will depend not so much upon the order to which they belong as to their individual devotion to their employer's interests, and the fidelity with which they stand by him in time of need and assist him in his extremity. Men who have thus served others have come to rule empires, and thus only can they rise.

## HYDRAULIC MINING IN CALIFORNIA.\*

No. 9

(By ARD. J. BOWIE, JR., A. B., Mining Engineer.)

## Blasting.

Where the ground is very hard, recourse is had to blasting. For this purpose a small powder-drift is run in on the bottom from the face of the bank a given distance, proportionate to the ground to be blasted. From the end of the straight drift a cross drift forming a T is driven. For example, in hard cement like that at Smartsville, with an 80-foot bank, in a case where the ground is ordinarily bound, a drift is run in at the bottom of the bank, say 85 feet long. At the end of it cross drifts are run out respectively 45 feet in length. Forty feet from the face of the bank two similar cross drifts are also driven. From the ends and center of each cross drift two small "lifters," as they are called, are driven at right angles, extending respectively half way between the cross drifts and the face of the bank. These places are then filled with powder, which, in such ground as is in that locality, would require from 450 to 500 kegs.

The heads of several of the kegs being removed, the main drift, is stamped, and the powder is exploded by means of an electric battery or fuse.

Occasionally in large blasts several cross drifts are required, and in such cases it is customary to fire the powder simultaneously in several different places by electricity. The quantity of powder used is determined by the position, character, and height of the bank, a sufficient quantity only being taken to shatter it.

In some places with lighter material two or three hundred kegs of powder will easily do the work that 500 or 600 barely accomplishes in heavy cement. At Blue Point a blast of 2,000 kegs was exploded. At the Enterprise mine, 250-foot banks, a blast of 1,700 kegs was fired. The powder is of the ordinary blasting quality. For destroying large pieces of lava, pipe-clay, boulders, stumps of trees, giant powder cartridges are found very efficient.

It is customary in certain districts to wash off the top or lighter gravel, and subsequently blast the bottom cement. For this purpose shafts 15 to 20 feet deep, as may be demanded, are sunk, and a small chamber is excavated in the bottom of them. The chamber is charged with five or six kegs of powder, tamped, and then exploded by electricity. Undoubtedly there is a great waste of powder in bank blasting, and the subject is worthy of investigation, with a view to future improvement in this particular. In blasting it is desirable to thoroughly shatter the material, i. e., separating rock and cement, so as to facilitate its washing, thus insuring the earliest separation of the gold, by enabling the hulk of the precious metal to come in immediate contact with the quicksilver in the head of the sluices, and affording every opportunity for the most complete scouring, and securing of the eroded gold particles.

The following method of bank blasting has been found to give excellent results with banks from 50 to 125 feet high, such as are generally encountered in hydraulic mining, and likewise in cement gravel of ordinary tenacity. In the absence of more definite knowledge on the subject, its adoption can be recommended.

The main drift should be run in a distance two-thirds the height of the bank to be blasted. The cross-drifts from the end of the main drift

Sketch of a Drift Showing the Arrangement of the Wires for Exploding a Blast.

should be driven parallel with the face of the bank, and their lengths determined by the extent of the ground which is to be blasted. A single T is all that is necessary. The amount of powder required for charging the drift is from one-half to two-thirds of a keg of powder, minimum quantity, per 1,000 cubic feet of ground covered by the drifts—i. e., height of bank  $\times$  length of cross-drifts  $\times$  length of main drift = cubic contents. The quantity of powder used must depend on and vary with the position of the bank and character of the gravel.

Late experiments made with Judson powder, applied as above directed, has given good results, and, though not definitely determined, the indications at present are that the use of this new explosive will be a great saving in the costs of bank blasting.

The shattering effects of powder used in the manner and proportion already described have been roughly estimated from the appearance of the ground subsequently washed at from 225 to 230 cubic feet of ground shattered per pound of powder exploded.

\* A paper read before the American Institute of Mining Engineers of the Wilkes-Barre meeting, May, 1877.

† Ordinary black blasting powder, 25 pounds per keg.

‡ The quantity of powder is increased when the banks are strongly bound, or when the gravel is exceedingly tough.

§ Experiments made with blasts of 250 to 400 kegs of powder.

Apropos of tamping, one of the attendant costs of bank blasting, it may be well to remark that as yet, with the present explosives employed, all experience in bank blasting proves that, with a strong tamping, the best results are obtained. With 150, 250 and 350-foot banks a different method of blasting is adopted. The main drift in such cases is driven in from the face of the bank 45 to 50 feet in length. The cross-drifts are run parallel with the face of the bank, and their length determined by the ground to be moved.

In charging these drifts the amount of powder used should be sufficient to blow out the bottom ground (the line of least resistance), the bank the falling by its own weight. The firing of all blasts is best done by electricity, and

wheel is attached, and, using 30 inches of water, it lifts stones weighing 11 tons. The guys are held by double capstans.

The derrick is not taken down when moved. It can be readily moved 100 feet in 10 hours.

## Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last, Dr. Gibbons in the chair. Rock specimens were presented to the society, showing glacial action, in one of which was imbedded a portion of bone. The society also received from Mr. Winslow, I. Howard's collection recently from Arizona. Dr. Kellogg described a new species

Section of Hoisting Machine with Hurdy Gurdy Wheel. Used in Hydraulic Claim attached to Derricks for Handling Boulders.

where the dynamite exploders with platinum wires are used the compound circuit is most desirable.

The powder in boxes or kegs is piled up in rows in the drift. Two wires, A A and D D, extending along the middle row, the tops of the boxes on which the wires rest being removed.

of "hog peanut" vine named *Amphicarpaea arizonica*. A paper by Prof. John Leconte, President of the University of California, on "Mars and his Moons," was read by S. B. Christie. Mr. Lorquin spoke about the society being represented by some of its collections at the Paris exposition. The subject was referred

GROUND PLAN OF HOISTING MACHINE.

The exploders, b b b, are inserted in Giant powder cartridges and placed on top of the paper covering the powder. (The Judson powder comes covered with strong paper to exclude moisture.) The wires, A A and D D, are then connected with the wires, Y Y and X X (as shown in sketch), which extend to the battery.

## Derricks.

In working hydraulic claims, boulders are frequently encountered that cannot be removed by hand. To facilitate their removal a strong derrick is used. The bedrock derrick now in use has a mast 100 feet high, and a boom 92 feet long. The whole is set in a cast-iron box placed on sills. It is held in position by six guys of galvanized iron wire rope one and one-eighth inches in diameter. A whiplock with three-quarter inch diameter steel rope is used for the hoisting tackle. A 12-foot diameter hurdy-gurdy

to the council, with a request that action be taken. Mr. Hollister presented to the society a specimen of the Japanese persimmon, grown in Mr. Hollister's orchard at Santa Barbara. In Japan, it is said, as many varieties are grown as of the apple here, and the sweetness of the fruit is always retained.

The Idaho mine, of Grass Valley, paid, on Monday, its one hundredth, or centennial dividend, the amount being \$15,500. The mine commenced paying dividends in 1869, and has paid regular monthly dividends to this time, the aggregate amount being \$2,270,820. Beside the payment of these dividends the mine has paid for the erection of costly hoisting works, a 35-stamp mill, and a fire-proof brick building for the pumping engines, air compressors, and all the improved apparatus used in mining.

## The President's Message.

On Monday the regular session of Congress began at Washington, and President Hayes transmitted his message upon public affairs. The document is quite long and for the benefit of those who have not leisure to peruse it in *extenso*, we prepare the following summary of the points made. After alluding to the general peace and prosperity of the past year, the President proceeds to consider the situation in the Southern States. He declares that the withdrawal of troops from the South and throwing the management of affairs upon the State authorities have resulted in the disappearance of turmoil and turbulence, induced an improvement in public credit, a revival in commerce and a hope of general prosperity.

On the financial question the President is pronounced against measures which interfere with the resumption of specie payments in 1879. He finds several strong reasons for opposing the making legal tender of silver coin, but approves a new silver coinage which shall make it practically equal in value with gold, so that an equilibrium can be maintained and both metals retained in circulation in their appropriate spheres of common use.

On civil service reform the President declares his belief in the appointment of men to office on the special ground of fitness and the retention of officers for long periods in offices which require special acquirements and qualifications. He thinks that the Civil Service Commission appointed by Grant should be recalled to devise proper rules for the service.

On the subject of foreign relations the President states that the recognition of the Diaz government in Mexico has been delayed by the outrages upon our frontier at the hands of Mexicans. Congress is urged to take measures to protect our citizens against further trouble on the border. Concerning the application of the Samoan islands for a protectorate the President says their claims shall be carefully considered.

In allusion to the report of the Secretary of the Treasury, the following is a statement of the National book-keeping: The revenues of the Government during the fiscal year ending June 30th, 1877, were \$269,000,586.62. The total expenditures for the same period were \$228,660,008.93; leaving a surplus revenue of \$30,340,577.69. This has substantially supplied the requirements of the sinking fund for that year. The estimated revenues of the current fiscal year are \$265,500,000, and the estimated expenditures for the same period are \$232,430,643.72. If these estimates prove to be correct there will be a surplus revenue of \$33,069,356.28—an amount nearly sufficient for the sinking fund for that year. The estimated revenues for the next fiscal year are \$269,250,000.

The President recommends the increase of the army to one-third more than its present numbers. On the Indian question the message is on the side of fair dealing and encouragement of the natives in the art of civilization.

On the subject of timber lands and the new desert land law we quote the President's words as follows: "I invite the attention of Congress to the importance of the statements and suggestions by the Secretary of the Interior concerning the depredations committed upon the timber lands of the United States, and the necessity for the preservation of forests. It is believed that measures taken in pursuance of existing laws to arrest the depredations will be entirely successful if Congress, by an appropriation for that purpose, renders their continued enforcement possible. The experience of other nations teaches us that a country cannot be stripped of its forests with impunity, and we shall expose ourselves to the gravest consequences unless the wasteful and improvident manner in which the forests of the United States are destroyed be effectually checked. I earnestly recommend that the measures suggested by the Secretary of the Interior for the suppression of depredations on the public timber lands of the United States, for the selling of timber from the public lands, and for the preservation of forests, be embodied in a law, and that, considering the urgent necessity of enabling the people of certain States and Territories to purchase lumber from the public lands in a legal manner, which at present they cannot do, such a law be passed without avoidable delay.

On the subject of desert lands the President thinks something should be done to induce their reclamation and thinks they might be leased for long terms to parties for stock growing.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from the prominent mines have been as follows: Con. Virginia, Nov. 27th, \$204,744.32; California, Nov. 27th, \$328,604.26; Tybo Con., 24th, \$4,123.84; Northern Belle, 26th, \$4,706.03; Standard, 26th, \$32,706.74; Grand Prize, Dec. 1st, \$17,400; Martin White, Nov. 29th, \$19,100; Manhattan, 28th, \$7,841.10; Tybo Con., 27th, \$7,933; Endowment, Dec. 1st, \$2,197; Con. Virginia, Nov. 27th, \$202,304.25; California, 27th, \$232,682.22; Northern Belle, 28th, \$4,741.55; Northern Belle, Dec. 1st, \$5,987.70; Tybo Con., Nov. 30th, \$4,080.65; Grand Prize, Dec. 5th, \$22,600.

## California State Finances.

It is probable that we cannot make better use of a part of a column than by showing forth the facts of the financial condition of our State as they are laid down in the report of the Controller, Hon. W. B. C. Brown, which has just been submitted to the Governor. These facts are frequently alluded to by our correspondents and they should be in the minds of all citizens. From tabular statements of receipts into the treasury it is seen that the receipts were: Twenty-seventh fiscal year, 1875-6, \$3,651,895.39; twenty-eighth fiscal year, 1876-7, \$4,549,258.30; total, \$8,201,153.69.

Expenditures: Twenty-seventh fiscal year, 1875-6, \$3,961,964.18; twenty-eighth fiscal year, 1876-7, \$3,785,111.35; total, \$7,747,075.53; excess of receipts over expenditures, \$454,078.16.

The amount reported by the Controller to the Superintendent of Public Instruction, subject to apportionment for the support of common schools, from Feb. 24th, 1875, to and including Feb. 1st, 1877, was \$2,792,688.43. The amount apportioned for each scholar was \$7.68 for the year ending Feb. 22d 1876, and \$7.98 for the year ending Feb. 21st, 1877. The whole amount distributed during those two years, was \$2,792,204.10, leaving a balance in the school fund, Feb. 21st, 1877, unapportioned, of \$484.33.

The amount of bonds now held in trust by the State Treasurer for the University fund yield an annual income of \$50,040. The total amount drawn from the State Treasury for support, aid, and endowment of the State University and for the support of the State University Library, during the twenty-seventh fiscal year, was \$92,690.88; of which the sum of \$50,040 was derived from interest on bonds, and \$42,652 from other sources; while the total amount drawn for the twenty-eighth fiscal year was simply the interest on bonds, amounting to \$50,040.

The total funded debt of the State on June 30th, 1877 was \$3,411,000.

Of the cost of assessing and collecting State taxes the Controller says: The percentage paid for assessing, auditing, collecting, keeping and paying in State taxes was a little more than 5.8% of the gross amount of property tax collected for the twenty-seventh fiscal year, and a little more than 5.5% for the twenty-eighth fiscal year. This percentage added to the above percentage of delinquency shows that the entire percentage of delinquency and for assessing, auditing, collecting, keeping and paying in State taxes for the twenty-seventh fiscal year was about 16%, and for the twenty-eighth fiscal year a little more than 11%. To secure greater economy in this branch of the service the Controller thinks that compensation to county officers, for auditing, assessing, collecting, keeping and disbursing State taxes or other moneys, should be abolished, save in the case of the County Treasurers, who should be allowed their mileage for bringing the State money to the State Treasury.

The rate of taxation for the twenty-seventh fiscal year (1875-6) was 60.5 cents, and for the twenty-eighth fiscal year (1876-7) was 73.5 cents on each \$100 valuation of property. The means necessary to defray these expenses will have to be made by the Controller.

The total amount of the estimate for the two fiscal years to come is \$5,715,784.15, of which \$2,757,939.15 will be required for the thirtieth fiscal year; and \$2,957,845 for the thirty-first fiscal year.

## India Rubber Plants.

Since an "India rubber tree," has been described as growing well in Sacramento (and, if we are not mistaken, plants yielding an elastic gum have been introduced in other parts of the State), there has been quite an interest awakened among those who are on the *qui vive* to test all possible products. Nor has this interest been confined to our State. It has excited tree growers in the old cotton States, and the Department at Washington has been besieged for plants. Superintendent Saunders, in his report to the Commissioner of Agriculture, expresses disbelief that the India rubber plant can be successfully grown anywhere in this country, because they are of strictly tropical character. Notwithstanding this apparent damper upon zeal in this direction, Mr. Saunders gives an enumeration of the leading India rubber plants which all readers will be pleased to possess. We take the following points from his report: "In the East Indies rubber is collected from *Ureola elastica*; from several species, of *Ficus*, mainly from *Ficus elastica*; and from a few other species, natives of the East Indies and western tropical Africa. South American rubber is also extracted from plants of different genera. The best is said to be obtained from the *Hevea brasiliensis*, a native of the Para forests, considered to be distinct from the *Stiponia elastica*, which furnishes the largest portion of the rubber entering into the commerce of that country. The sand-box tree, *Hura crepitans*, yields a milky juice which is similarly converted into caoutchouc by evaporation. These plants belong to the natural order *Euphorbiaceae* a large family of plants, mostly yielding a milky juice, containing acid and poison-

ous properties. Mexican rubber is extracted from a native tree, the *Castilloa elastica*, which grows abundantly near the Gulf coast. This plant is botanically allied to the rubber-producing *Ficus* of the East Indies. A new elastic gum has recently been produced in Mexico, which is said to be derived from a native herbaceous plant allied to the family of asters. This plant would probably succeed in the Southern States. These are strictly tropical trees, for which we have no suitable climate; but attention might probably be directed to the gum-producing Mesquite tree of Texas, *Algarobia glandulosa*, which yields a non-elastic gum of the nature and possessing all the essential qualities of gum-arabic.

**A NEW SAFETY DYNAMITE.**—An improved nitro-glycerine compound, says *Seward's Journal*, has been invented by Mr. Gustaf Fahnebjelm, of Stockholm, the chief modification being that the second main ingredient is charcoal produced from a special wood, and selected and prepared in such manner as to be able to absorb and solidify the greatest possible quantity of nitro-glycerine. In order to render the combustion more complete, and to augment the rapidity of the explosion, a small quantity of nitrate of potash or other suitable salt, is added to the mixture of the two ingredients above named. The composition of the new sebastin depends upon the objects for which it is to be used, and the effects intended to be produced. The strongest compound, and even in this there is stated to be no risk of the separation of the nitro-glycerine, is composed of 78 parts by weight of nitro-glycerine, 14 of wood charcoal, and eight of nitrate of potash; and when less power is required the proportions are varied, the second quality consisting of 68% by weight of nitro-glycerine, 20 of charcoal, and 12 of nitrate of potash.

**THE NERVELESS MORTAL.**—A perfectly impassive, emotionless man or woman is a rarity; still, such do exist, and we hardly know whether to regard them as objects of envy or pity. Those without emotion, those who do not suffer at times from over-sensitiveness or excitement, are like rocks or trees; the winds of adversity may blow, a deluge of affliction may cover them; they remain calm and happy, the sleep is sound, the appetite unimpaired. Such are certainly enviable conditions, but the law of compensation is not annulled for the benefit of these favored ones. Wherever we find them, we may be sure that we meet those devoid of the finer and more delicate instinct of human nature,—those who are incapable of enjoying the beautiful things in the natural world or in art. They suffer less in the journey of life, but they also enjoy less. Like animated statues they live, without strong friendship or affections, without pity, without generosity; and nerveless they die, with scarcely a pang. The world regards them with suspicion during life, and refuses to weep when they pass away. It is for wise reasons that but few of this class are permitted to make their advent into the world.

## The Free Labor Exchange.

We have received the following circular of the Free Labor Exchange, which we publish for the benefit of all whom it may concern:

The Free Labor Exchange established by voluntary donations, is now open for business, and the co-operation of every employer throughout the State of California and the Pacific coast is earnestly and respectfully requested. Its object is to provide work for the needy, and distribute to the best advantage the large and surplus number of laborers and mechanics now gathering in San Francisco.

The advantages offered by the Labor Exchange are furnished without any charge whatever, being absolutely free to all, and the management will take especial care in the selection of competent and reliable employees.

FARMS will be supplied with skilled and unskilled husbandmen.

HOTELS can be furnished with good cooks, waiters, servants, chambermaids and clerks.

FACTORIES will have their help forwarded according to orders, from a laboring man to a skilled engineer and superintendent.

SAWMILLS and lumber camps may order their sawyers, loggers, edgers, planers, screw-turners, choppers (by cord or contract) and others.

MINES can order their drillers, timberers, blasters, time-keepers, engineers, laborers, etc.

FEMALE servants of any description or nationality will be carefully selected at short notice, for the city or country, on receipt of the necessary traveling expenses, as customary for female help only.

All employers residing in the country are requested to be particular in sending their orders, and to mention the exact duties required of employees, the wages offered, the route it is desirable for them to take to reach their destination; and in order to prevent disappointment and useless expense, it is hoped that ample time will be allowed to select and forward help. Any information about the supply and price of labor will be furnished at any time by this Exchange.

Apply or address all communications of follows, viz.: THE FREE LABOR EXCHANGE, P. O. box 2,173, Nos. 33 and 35 O'Farrell street, (near Market, between Dupont and Stockton street,) San Francisco, Cal.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large white skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

**DEWEY & CO'S**  
**SCIENTIFIC PRESS**  
**Patent Agency.**

SCIENTIFIC PRESS, Mining and Mechanical.  
PACIFIC RURAL PRESS, Agricultural.

Office—202 Sansome St., N. E. Cor. Pine, S. F.

PATENTS obtained promptly; Caveats filed expeditiously. Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted. Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to undoubtedly satisfy our patrons, and our success and business are constantly increasing. The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

DEWEY & CO., Patent Solicitors.  
San Francisco, 1877.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly. The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from this office for 50 cents, postpaid. Wholesale and retail agents wanted.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and the subscribers against the acts and mistakes of others.

## ARTIFICIAL LIMBS.

MENZO SPRING,

MANUFACTURER OF  
ARTIFICIAL LIMBS.

OFFICE AND ADDRESS,

9 Geary St., San Francisco.  
Descriptive circulars, blanks for measurements, with instructions and price list free on application.

**PALACE RESTAURANT.** J. V. Websters large, fine, new Dining Rooms are exceedingly popular. The best of everything on the tables. Dinner furnished at the low price of FIFTY CENTS, from six to eight P. M. Visitors to S. F. should try the Palace.

## TAXES.

## TAXES.

1877-1878.

Notice is hereby given, that a certified copy of the Assessment Book of the Taxable Property of the City and County of San Francisco, Real Estate and Personal Property (Subsequent Assessment Book included), for the Fiscal Year 1877-78, has this day been received; that the State, City and County TAXES for said fiscal year are now due and payable at the office of the undersigned, Room No. 1, City Hall, and the Laws in regard to their collection will be strictly enforced.

Taxes will become delinquent on the FIRST MONDAY in January, 1878, and unless paid prior thereto, Five per cent. will be added to the amount thereof.

WM. FORD,

Tax Collector of the City and County of San Francisco.

SAN FRANCISCO, October 22, 1877.

## Montgomery Avenue Tax.

Notice is hereby given that a certified copy of the Assessment Book of Real Estate, which is subject to Assessment to defray expenses incurred by the opening of Montgomery Avenue, has this day been placed in my hands to collect Taxes thereon.

Said taxes are for the Fiscal Year 1877-78, and are now due and payable at the office of the undersigned, Room No. 1, City Hall. All Taxes remaining unpaid on the FIRST MONDAY of January, 1878, will have Five per cent. added thereto.

WM. FORD,

Tax Collector for the City and County of San Francisco.

SAN FRANCISCO, October 22, 1877.

## ASSESSMENT OF LANDS

## Benefited by Widening Dupont St.

Notice is hereby given, that a certified copy of the Assessment Book of the Real Estate which is subject for the payment of Principal and Interest upon "Dupont-Street Bonds," as directed by an Act of the Legislature of California to authorize the Widening of Dupont Street in the City of San Francisco, "Approved March 23, A. D. 1876," has this day been placed in my hands for collection. The Laws in regard to the collection of the same will be strictly enforced.

WM. FORD,

Tax Collector of the City and County of San Francisco.

SAN FRANCISCO, October 22, 1877.

## Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the HAMPDEN WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in tact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

DEWEY & JORDAN, Agents,  
433 Montgomery St., S. F.

DEALERS IN

**H. W. JOHNS' ASBESTOS ROOFING AND PAINTS—Fire and Weather Proof.**

ASBESTOS STEAM PACKING, made from pure long fiber Asbestos. Indestructible and Self-Lubricating. Circulars and Descriptive Pamphlets Sent Free.

We have the best Imitation Gold Watch in the Market for Trading Purposes. The metal is a composition of other metals, so closely resembling gold that the best judges find it difficult to detect the difference, except by a chemical test, and it has the virtues requisite to make it the best substitute for gold known. GENUINE AMERICAN MOVEMENT. EXPANSION BALANCE. BEAUTIFULLY ENGRAVED OR ENGINE TURNED HUNTING CASES, and equal in appearance to a GOLD WATCH THAT COSTS FROM \$150 TO \$200. It sells and trades readily, but from \$50 to \$100, and if you wish a watch for your own use or to make money on, try this. Owing to our large sales, we are enabled to reduce the price of them to \$12 each with an elegant Chain attached. They are used on Railroads, Steamers, and in Manufactories, and other places where accurate time is required, and gives general satisfaction. We send them by Mail or Express on receipt of \$12, to any part of the Country, or it will be sent C.O.D. when the customer desires and remits \$3 on account. These elegant CHAINS weigh about fifty Pennyweights, and the same pattern in pure gold would cost \$100. We sell these Chains at \$3 each. But we sell the Watch and Chain for \$12, sent by Mail in a Kidder's Package, post-paid, to any Post Office in the United States.

WE SELL THE WATCH WITHOUT THE CHAIN FOR \$10.  
J. BRIDE & CO., Clinton Place & No. 11 Eighth Street, N. Y.

**To Ship and Engine Builders, Steam ship Companies, Etc.**

A Mechanical Engineer, having an extensive experience in Marine Engineering (especially compound) and Iron Ship Building, also in Steam Engines and Machinery in general, is open for engagement. First-class references. Address and references can be obtained at office of SCIENTIFIC PRESS.

FOR SALE.—A Good Type-Writer. Price, \$50. For further information, address "COPYIST," this office.

**San Francisco Cordage Company.**  
Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes: Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

**TUBBS & CO.,**  
611 and 613 Front Street, San Francisco

**WIND MILL.** One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

**MINING INTEREST FOR SALE.**

For a small amount, in several claims on one of the

**RICHEST LEDGES IN ARIZONA.**

Money needed for development. The ore will pay a handsome margin to ship to the city. Apply at this office.

Continued from Page 357.

is a good place for capital to invest. The mines are easy of access, with plenty of wood and water.

### Arizona.

**LIBE.**—*Arizona Sentinel*, Nov. 28: E. E. Chilson has gone to California for supplies. He tells us that he bought the Buckeye, in Globe district, for \$5,000, after selling the Buena Vista for \$7,500. He says the Miami mine has turned out over 300 tons of ore, from a vein now five feet wide, that goes \$200 to \$300 per ton. Townsend's mill was to have started up this week. The road from the mill to the Miami was all finished except a short elbow close to the mine.

**PROSPECT DISTRICT.**—*Arizona Citizen*, Nov. 28: A party just in from the Pioneer country informs us that the boys out there are going way down on several of their "way up" mines with most encouraging results. The "Connelly boys" are not doing much work just at present, their rich strike has paid them so well that they have concluded they can afford to take a little rest.

The Copper Top and the Yankee veins, are extensions of the Silver Queen and are the best developments in that section. Our informant says there is a large body of mineral in sight, and he has seen chunks of ore taken out that assay from \$150 to \$1,000 per ton. There are two veins of mineral and the shafts are down on each from 10 to 15 feet. The Silver Queen shows considerable copper while the ore in the extensions is a gray carbonate. This was mentioned as a peculiar fact.

The Wheeler claim, on the same belt, has a 16-foot shaft, and the ore assays from \$200 to \$1,400 per ton, also a gray carbonate. The Silver Bell is looking first rate. An incline has been run on this claim, and is now down between 40 and 50 feet. The vein is from 15 to 20 feet wide, and carries handsome free milling ore.

**McMILLAN CAMP.**—As to the mines, they have never looked so promising as now. The McMillan company are taking out the regular amount of pure silver, about \$100,000 per month. The Little Mac is only second to the McMillan. The Gen. Lee company have started work, and with a force of six men at present, (in the opinion of your correspondent), will, in 30 days from date, be numbered with the paying mines of McMillan camp. Their line is only 20 feet from where the McMillan company have lately struck a six-inch vein of solid chloride ore worth \$8 to \$10 per pound. There are a number of good prospects here, and no time to investigate as yet, but will keep you posted. One other prospect (pretty good one) lays about half way between Ramboz camp and the Champion mine. This is Bixby's. At present a force of eight men are taking out about 10 tons daily that will average \$1,000 per ton. How is that for a prospect?

### Dakota.

**GOLDEN TERRA.**—*Black Hills Pioneer*, Nov. 25: This mine is one of the bonanzas of the Hills. A breast of ore some 20 feet in width is being worked, and several shafts and tunnels have been sunk and run into the hill, all proving the mine to be a mass of gold-bearing quartz. That portion owned by C. D. Arms, together with the mill machinery, has been sold to Gilmer, Salisbury & Hurst, for \$83,000 in cash, possession to be given in a few days. The mill is a Carter's patent process, and when in good running order will crush a ton of ore every hour. A cleanup, made from a six days' run, resulted in 720 ounces of gold bullion. The 500 feet on the east side of the gulch is owned by J. W. Bailey, and has a 10-stamp mill in operation. This mine is worked more systematically than the other, and good ore is obtained in every direction.

**FOREST CITY.**—This place is being built up slowly but surely. The Spearfish and Bear Creek ditch is being rapidly pushed toward completion. It is being excavated from both sides, employing 15 Chinamen and but 30 white people.

**GOLDEN STAR.**—This mine is now owned by Yerxa & Stone. The shaft is down 138 feet, following the vein, which is now about three and one-half feet in width, the ore prospecting very highly, and showing free gold. About eight tons have been extracted. The lucky owners have been offered a 10-stamp mill for a half interest in the mine, but refused.

**NUMBER 1** above discovery on Deadwood, is being worked day and night, and is yielding good pay. It is the design of the owners to work all winter, and dump for spring sluicing.

**NUMBERS 7 and 8** below discovery on Deadwood, owned by Walters & Burrill, are being worked from the surface to bedrock, and good pay obtained.

**NUMBER 9** below discovery on Deadwood is now owned by Seeland, Tibbets & Watts, who purchased it from John McAleer, who took out a large sum of money last season. The present proprietors are reworking the gravel, which pays good wages. The unworked ground pays richly.

**NUMBER 3** above discovery on Deadwood is being worked by a day shift only. It is 23 feet to bedrock. This claim paid \$50 to the set of timbers last week.

**LEUELLA.**—The debris has been removed from the cave, showing a large quantity of ore that came down with the gangue. About 20 tons of good paying quartz are daily extracted from this large cut.

**GUSTIN.**—A large quantity of ore has been broken down at the mouth of the tunnel, exposing a body of ore, larger than was expected. The quantity taken from the side of the tunnel has increased its width to about 25 feet. The daily yield is about 35 tons.

**NUMBERS 17 and 18** below on Deadwood have suspended work until Monday next on account of the difficulty with the bedrock drain.

**THE Davenport 10-stamp mill.** C. H. Enos, Superintendent. This mill, at Lead City, Nov. 17th, cleaned up 824 ounces of gold, worth \$10.50 per ounce, from a four days' run on ore from the Homestake No. 1. The amount crushed was 70 tons.

**CALM No. 10** below discovery is owned by Messrs. Buckley & Co. and is one of the best on Deadwood creek. Last season the owners took \$40,000 from a breast of earth less than 20x50. At this point the bedrock pitches into a basin, from which \$2,000 were taken in one shift of eight hours. Mr. Buckley informed our reporter that at present the claim is not yielding very large returns, on account of the smoothness of the bedrock.

### Idaho.

**Mining Notes.**—Owyhee *Avananche*, Dec. 1: At the Golden Chariot work has been progressing for the past few weeks under very favorable auspices. The shaft has been sunk to the 1500-ft level and to a depth of about 25 feet beyond that point. The workmen will commence some time next week on the crosscut.

At the Black Jack mine, on Florida mountain, the force has been busily engaged on the hoisting works, which are now going rapidly forward to completion.

A. J. Sams has a force of about 15 men at work on the Illinois Central. They are taking out some good rock. The Eagle mine will probably be resumed on the War Eagle mine in a short time. Mr. Oberdorfer, the recent purchaser of the property, will probably employ a small force of men during the winter.

**Porot.**—Although the recent crushing of Porot's rock did not turn out as well as was expected, the parties who have always had faith in the prospects of this mine express the belief that abundance of rock can be taken out during the winter, which will yield from \$40 to \$70 to the ton.

**ELMA.**—A. S. Thompson and brother are running a tunnel in their mine, the Elma, which is on the Empire side of War Eagle mountain.

**EMPIRE.**—Matters at the Empire remain *statu quo*. We learn from Mr. Crane, who is here representing the company's interests, that work will probably be resumed next week.

### New Mexico.

**THE LEGAL TENDER.**—*New Mexican Herald*, Nov. 24: We took occasion, last Monday, to walk up to and climb down into the Legal Tender mine, located on the northern slope of Tunnel hill. Numerous piles of graded ores

obstructed the pathway, and, upon the summit of the hill, a rough pile of unassorted ore, thrown out in a circular ridge, indicated the main shaft. The Legal Tender is the original discovery which led to the building of the town of Silver City. Shortly after the influx of miners set in, the Chloride district was discovered, and as everybody felt disposed to grasp at the richest thing in sight, work upon this lead was abandoned. Within the past week, Messrs. Weeks & Yankee, who have secured all the other interests, came to the conclusion to push work on the mine and the result shows that they were wise in their determination. There are three shafts now sunk—one of 30 feet, one 45 feet and one 50 feet. From the bottom of the 30-ft shaft a drift of 50 feet has been run in an easterly direction along a well-defined vein of ore, which assays 50 ounces to the ton. The 45-ft shaft has a drift of about 80 feet, following a large body of ore, which inclines to the westward. At the end of the latter shaft an extensive deposit of ore has been struck, the face of which would indicate a vein running north and south. At the other end of the drift is found another large body of ore, bearing to the east. The 50-ft shaft follows a vein of ore 18 inches in width, running in a southeasterly direction. This is evidently the main vein and the average assay is \$250 to the ton. Here is where Messrs. Weeks & Yankee are now pushing their work, and the quality of ore exposed shows that they have done well to turn their attention to this particular part of the mine. The other veins show a width of from two to three feet; but, as we have said, this ore does not return over 50 ounces. We brought down a few fine specimens from the first-class dump pile. Experts here say they will run from \$500 to \$800.

### New Incorporations.

The following companies have filed certificates of incorporations in the County Clerk's office, at San Francisco: COPPIN M. Co., Dec. 1st. Location: Lyon county, Nev. Capital stock, \$100,000. Directors—Tod Robinson, J. B. McGee, C. H. Maddox, E. M. Hall and A. J. Blair.

FISG M. Co., Dec. 3d. Location: Esmeralda county, Nev. Capital stock, \$100,000. Directors—Alvin Potter, E. P. Figg, F. H. McCormick, W. B. Graue and Thos. Cole.

AMERICAN BORACIC ACID Co., Dec. 3d. Capital stock, \$2,500,000. Object: To manufacture and sell borax and other chemicals. Directors—L. W. Coo, A. W. Preston, A. L. Day, R. W. Van Brunt and P. H. Krauer.

MANZANITA CON. GRAVEL M. Co., Dec. 4th. Location: California. Capital stock, \$500,000. Directors—T. J. Owens, J. M. Fulwiler, W. Thorpe, D. C. Jones and F. Vessault.

MONTANA AND CALIFORNIA M. Co., Dec. 4th. Capital stock, \$5,000,000. Directors—J. Weil, M. Wasserman, L. Weil, H. A. Waterman and F. Frankenthal.

## PATENTS AND INVENTIONS.

### List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.)

By Special Dispatch from Washington, D. C.

WEEK ENDING NOVEMBER 20TH.

PRODUCTION OF WOODEN BOTTLE-STOPPERS AND BUNGS.—Frank A. Howitz, S. F.

WASHING MACHINES.—Ives Scoville and Pliny Bartlett, Oakland, Cal.

HYDRAULIC AND WIRE-ROPE PUMPING SYSTEM.—William P. Barclay, Virginia City, Nev.

GEOGRAPHICAL CLOCKS.—William A. Cates, Union, Ogn.

WRENCH.—Calvin H. Crowell, Stockton, Cal.

SAW HANDLER.—James N. Dudley and John Anderson, Petrolia, Cal.

WINDMILL.—Henry C. Fallin, Grangeville, Cal.

DEVICE FOR TILTING CHAIRS.—Thomas A. Fitzsimons, Benicia, Cal.

CHILL MOLDS FOR WHEELS.—George eArthur, San Leandro, Cal.

SIGX.—Joseph Perkins, S. F.

TRADE-MARKS.

WHISKY.—More, Reynolds & Co., S. F.

WHITE LEAD.—Whittier, Fuller & Co., S. F.

The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with care and in the shortest possible time.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

**IMPROVED WRENCH.**—Calvin H. Crowell, Stockton. This invention consists in a novel arrangement for instantaneously setting the movable jaw or screw, of monkey wrenches, independent of the usual operating screw. It consists in mounting the movable jaw in such a manner that any considerable movement of the jaw can be quickly made to any point on the wrench bar, without the use of the nut and screw in the usual manner.

**DEVICE FOR TILTING CRUETS.**—Thos. A. Fitzsimons, Benicia. This invention relates to an arrangement of levers for tilting a suspended cruet, piteber or other vessel which contains a liquid and which is provided with a spout or nose from which the liquid is to be poured. The device is specially useful for enabling one to serve himself without inconvenience.

**WINDMILL.**—C. Fallin, Grangeville, Tulare Co. The improvement consists in the peculiar manner in which the fans are constructed. By the method adopted the inventor secures a noiseless, storm-proof and perfectly self-regulating mill, regulated in one case by the backward pressure caused by the centrifugal force of the fans and a weight combined, and again when its fans are balanced by the weights alone.

ALTHOUGH it is now legal to catch shad, none of that description of fish has yet appeared in the markets. The fishermen explain that the fish are still in salt water, and need not be expected in the rivers for a month or more.

### News in Brief.

AN international exhibition will be held at Milan in 1879.

THE Italian Chamber of Deputies has voted to abolish the death penalty.

NUMEROUS changes have been made in the city offices by the incoming municipal officials.

WILLIAM BUTLER was drowned by the upsetting of a boat at Cuffey's Cove on the 1st.

A \$45,000 fire occurred at the corner of Sixth and J streets, Sacramento, on the 29th inst.

COMMODORE CHARLES H. B. CALDWELL, United States Navy, died at Waltham, Mass., Friday night.

A FRANCHISE has been granted to the Ocean Beach Railroad Company for a railroad beginning at Fifth avenue and California street.

THE Ordish block at Watsonville, which cost \$10,000, was burned on the night of the 30th ult. Insurance, \$4,000.

A ROME correspondent states that the establishment of a Roman hierarchy in Scotland has been indefinitely postponed.

ADDITIONAL reports come of Indian outrages in the Black hills. General Crook has been ordered to afford relief to settlers there.

THE Second National Bank at Lafayette, Ind., has closed its doors on account of a defalcation by the Cashier.

SOME of the Supervisors of Rensselaer county, New York, have been indicted for fraudulently auditing bills against the county.

DURING the present month over \$3,000,000 in coin will be withdrawn from city circulation for the payment of State and municipal taxes.

THE automatic buoy outside the bar is reported a complete success. It can be heard distinctly four or five miles.

DR. WILLARD G. WAYMAN has been appointed a member of the State Board of Health, vice Dr. Herz, who is absent from the State.

THE Board of Supervisors of this city has ordered the purchase of the Point Lobos toll road, for \$25,000.

DISPATCHES state that there is a strong probability that the duties on tea and coffee will be restored during the coming session of Congress.

THE election of an assignee of Duncan's Bank will take place on the 19th inst. Only those who prove up their claims before that date will be entitled to take part in the election.

THE Santa Barbara Press states that stock is dying in many localities over the mountains. Oak brush has been cut to feed the cattle upon for some time.

COL. A. W. VON SCHMIDT has been on a visit to the wreck of the steamer *City of San Francisco*, and reports that there is no hope of ever saving the hull.

THE Republic Trust Company of Newark, N. J., have decided to discontinue business on account of difficulty in securing safe paying investments.

THE order granting Floyd and others to run a single track railroad down California street from Battery to Market, has been passed over the Mayor's veto.

THE Directors of the Philadelphia exhibition have determined to hold religious services on Sundays, but the clergymen have refused to officiate.

THE London Telegraph says it has received information that Kars fell through the treachery of a Pasha, who admitted the Russians to a commanding fort, and was paid for it.

HENRY KUPER, a tailor of this city, committed suicide on Sunday. Luis Ziegeuhert, a solicitor for Redington & Co., also committed suicide on the same day.

MAJOR PICO, arrested in Stockton for obtaining money under false pretences in the connection with the sale of land in Lower California, was tried on Friday and the case was dismissed.

THE following silver pieces were coined at the Philadelphia mint during November: Trade dollars, 400,000; half dollars, 834,000; quarter dollars, 722,400; dimes, 140,000. Total number of pieces, 2,096,400; value, \$1,011,000.

THE project once entertained of making Skeena river mouth the Pacific terminus of the Canadian railway, is abandoned. The choice lies between Butte and Burrard inlet. A decision is looked for shortly.

ABOUT 250 men are at work on the railroad between Benicia and Suisun. The track is being laid from Suisun across the tules, and the bridge across Cordelia creek is finished. With good weather, the track will be completed to Benicia by New Year's.

SINCE July 1st we have cleared only 48 cargoes of wheat, against 205 cargoes for the corresponding period last year. There are now 16 vessels, of 20,000 tons tonnage, in port under engagement to load wheat.

IT is doubted at the Vatican whether the Pope will ever again move from his bed. He looks well when recumbent, but when an attempt was made to dress him it was discovered that he could not sit upright.

OUR overland exports of treasure during November amounted to \$2,476,377, of which \$2,116,300 was in gold coin. We also sent \$753,115 to China, of which \$485,828 was in trade dollars; and \$23,000 to Central America—making a grand total of \$3,252,492.

A NEW Chinese theater has been opened in this city.

THE Jumel will case is about to be reversed, this time to claimants from France.

THE Society of California Pioneers have raised the admission fee from \$10 to \$100.

A SMALL steamer is to be placed on the upper Yamhill river, Oregon.

DIPHTHERIA is causing many deaths among children in Salt Lake.

THE British Indian expedition has so far met with uninterrupted success.

PHILIP DEVER of Marysville was accidentally shot while hunting near Marysville, last week.

SAM MILLS, of Nevada, found guilty of murder in July last, is to be hanged on December 21st.

WOODRUFF & ENNOR's stage to White Pine was stopped last Friday. The passengers were robbed of about \$150 in coin.

THE Indians are committing serious outrages in Texas, and the number of troops there is too small to afford protection to settlers.

SENATORS BOOTH and Jones were the only Republicans who voted against the Paris exposition bill.

THE British and German governments are making the telephone part of their telegraph system.

THE *Tuscarora*, surveying frigate, will soon proceed to the Gulf of California to complete work already far advanced.

THE Legislature has ordered the printing of 20,000 copies of the Special Senate Committee's report on Chinese immigration.

ADVICES from Chile state that the well-known Thomas' Bank of Valparaiso has failed. Liabilities, \$2,000,000.

THE Oakland Guard lost by the fire in their armory on Thanksgiving night, their arms and uniforms. The loss was \$4,000; insured for \$2,300.

THE directors of the narrow gauge railroad from Alameda to Los Gatos made the initial trip over the road this week.

CHIEF SCANNELL has been re-elected Chief of the San Francisco Fire Department by the new Board of Fire Commissioners.

A. MENKE's hop-drying house at Brighton, Sacramento county, was burned Sunday night. Loss about \$10,000.

ANDREAS MATEO was hanged at Napa on Tuesday of last week, for the murder of a man named Guadalupe on the 11th of June.

A fight occurred at Nord, Butte county, on Monday, between John Hallett and D. Wilson in which Wilson had his ear bitten off and Hallett was killed.

THE receipts from wharves for the month of November reached \$39,593; amount drawn from harbor improvement fund, \$17,466. Total, \$57,059. Disbursements, \$30,393; amount remitted to State Treasury, \$26,661.

MILTON S. LATHAM has sued the Universal Life Insurance Co., on an endowment policy for \$10,000, with profits payable when he should be 50 years old.

IN November there were 1,370 arrests made by our city police; 448 of them were drunks and 93 were charged with larceny. There were 207 voluntary lodgers in the city prison.

GERMANY has informed Switzerland that, subject to ratification by the German Parliament, it will contribute an additional \$2,000,000 toward the St. Gothard railway.

THE United States coast surveying schooner *Earnest* sailed from Baltimore November 6th for Puget Sound. She will go through the Straits of Magellan.

DURING November the mint in this city coined a total of 3,362,100 pieces, valued at \$4,216,500; \$3,194,500 was in gold, and \$1,022,000 in subsidiary silver. There were 146,000 double eagles.

LIMA dates of Nov. 12th say, that work on the Oroya railway and that of the Cerro De Pasco, together with the drainage of those famous mines, is about to receive a decided impulse.

DR. JOSEPH WALKER, of "Vinegar Bitters" fame, has been arrested on a charge of abandoning his wife. It is stated that his income is \$1,000,000 per annum.

THE new Directors of the Safe Deposit Company have decided to retain all the employees of the company, without any reduction of the salaries. The pay-roll amounts to about \$1,075 per month.

A DISPATCH from Coquimbo, Chile, says: The Pacific Steam Navigation Company's steamship *Atacama*, has been lost. The crew numbered 40 and the passengers about 50. Only 18 persons were saved.

A PETITION is being circulated, and has already received many signatures to have a steam fog whistle erected at Fort Point, as the one at South Head, which has been sustained by private enterprise for years past, is worn out and has been discontinued.

AMONG the amendments to the general deficiency bill reported by the Senate Appropriation Committee is one proposing an appropriation to pay claims allowed by the Treasury Department for services, supplies and transportation of Oregon and Washington Territory volunteers in the Indian war of 1865.

## The Chinese Problem.

The following petition to Congress emanates from the Chico Encampment of the Order of Caucasians, and W. B. G. Keller, Grand Secretary of the Order, says it has the endorsement of the entire body:

To the honorable Senators and Representatives of the United States, in Congress assembled:—The undersigned, citizens of the United States and of the State of California, respectfully represent: That the presence of Chinese in this State is a cause of great evil and of impending danger, which demands your earnest consideration. The well known habits and mode of life of the Chinese need only be mentioned to be admitted. They have no wish, nor do they intend, to become with us a homogeneous people. They look forward solely to the acquisition of a competence, and a return to China. They live upon a few cents' worth of rice per day, usually imported by their own merchants. They swarm together in large numbers in small rooms, thus saving rent, and at the same time engendering loathsome diseases. They have no families to support; but, on the contrary, the few women owned and kept by them are a source of profit. They are natural thieves, and property is unsafe everywhere from their wily and ingenious machinations. They are persistent liars, whom no court of justice, nor any resource known to our jurisprudence can control. Their natures and training enable them to live cheaper than it is possible for white men, with families, to do. They usurp and monopolize every department of labor in our country, whether suited to male or female, and they can and do fill every department of labor, at lower rates of wages than white men or women can live upon, and are, therefore, employed by capitalists and manufacturers. As a consequence of this condition of things, thousands of laboring men and women in the East, who would gladly seek homes in California, are deterred from coming to us; and the honest laborers of this State have been driven away, from their inability to support their families upon Chinese wages. There is another evil, arising from the residence of the Chinese among us, not so patent to casual observers, but of such magnitude as to cause a feeling of despondency for the future of our country. In every town of any magnitude there are dens of Chinese prostitution, open to the youths of our land—to very young boys—who are enticed thither by Chinese women—and who, for a few cents, can acquire a loathsome disease, ruin their constitutions and render themselves unfit to become the progenitors of a healthy and moral race. Trouble with the Chinese has already begun, and it is not incorrect to say that, however wrong the course may be, the people, urged to desperation, by a want of sympathy in, and a disregard for, their interests by the Government, believe that something must be done to protect and save their families from present and future destitution; and this belief—this desire to do something—is increasing at a rapid rate, and must, inevitably, bring about further collisions between the two races. To redress these grievances; to avert the danger which is surely impending; and to provide a happy and prosperous future for your suffering brethren, is not only a mark of wisdom and good policy, but is an imperative duty required at the hands of those intrusted with the legislation and the administration of public affairs. We, therefore, petition that the Burlingame Treaty be abrogated, or so modified, as to prevent the influx of Chinese to these shores, and for such other and necessary legislation as in your wisdom may be deemed requisite to relieve us of the blighting and deadly incalculable now pressing upon us. And we will, as in duty bound, ever pray, etc.

## Mining Share Market.

As mentioned elsewhere, the principal feature of the stock market for the week is the fact of Flood & O'Brien having obtained control of Ophir and Mexican. The brokers do not like this move very much, as it interferes with stock transactions. Still, if the new managers, as presumed, can work the mines one-third more economically by having them under one management, it will be better for stockholders than fluctuations in stocks. In this connection the Gold Hill News says:

The bonanza firm now controls the regular Virginia line of mines from the Chollar northward, and more concentration and unity of action may hereafter be looked for. It certainly will have a good effect in the matter of drainage, as in case of no compromise or arrangement being effected with the Sutro tunnel company, a combination can easily be formed to effect the drainage of the lower levels in some other way which might prove more advantageous than the tunnel. Moreover, if the bonanza folks will get the control of the mines, they must work and develop them. This has been a very expensive job thus far and it is no disadvantage to have somebody with plenty of money to foot the biggest portion of the expenses. The good prospects in Alta and the southern section of the lode generally continue. The transactions in the San Francisco Board for the week ending December 4th, aggregated \$3,000,000.

The Committee appointed to investigate the affairs of the Justice are reported as being diligently at work and will shortly make known the result of their labors.

## The Emma Mine.

EDITORS PRESS:—I will do justice to the London mining journals in saying that they did all in their power to convince the present Quixotic chairman of the Emma mining company, of London, to avoid lawsuits and its difficulties. He was informed of every circumstance by which he might have seen that he could have done his duty to the shareholders by accepting T. W. Parks' and Albert Grant's offer of \$250,000 hard cash if he would only have the mine properly worked. This amount was to be paid out of future profits. Three-quarters were to be paid to the largest shareholders, and one-quarter to pay off the \$250,000. Such an offer as that could only be refused by a man who was acting from interested motives. He was desirous of being looked upon as the savior of English commercial purity, and punishing, as he thought, all the promoters of the Emma mining company, heedless of their real interests, and endeavoring to make capital for being elected a member of Parliament. The gradual developments in the mine are convincing the unbelieving English public that there is a great future for the mine, and it will be proved soon who was right, Mr. H. Sewell, in advocating by every possible means the working of the mine, or the lawsuiting chairman, who in this undertaking was, of course, backed by the wrecking solicitor firm of F. Snell & Co., of London. The last act in this great mining drama will soon be represented. ONE WHO KNOWS.

## Musical Instruments.

The firm of Kohler & Chase, of 633 and 635 Clay street in this city, is an old established and trustworthy house, dealing in pianos, organs and all other kinds of musical instruments. They are extensive importers of instruments and instruction books, and have long held an enviable position in this branch of trade. We take pleasure in recommending them to all our readers who wish to introduce the refining influences of music to their homes. The firm make a specialty of the Decker Brothers' piano, the Mason & Hamlin cabinet organ, the Emerson piano and the J. & C. Fischer upright piano. All of these instruments have gained a wide fame for excellence and won high praise from those who know best what constitutes excellence in a musical instrument.

We would speak especially at this time of the Decker Brothers' piano. We cannot do better than present a testimonial of its quality, freely given by a group of musicians whose praise will commend itself to all music lovers. During the Centennial there was held in Philadelphia a grand musical congress, at which the Decker Brothers' instruments were used, and the result was the following straightforward endorsement:

PHILADELPHIA, June 27th, 1876. The Decker Brothers' Grand pianos, used by the Musical Congress at their grand operatic concerts and musical festivals, recently given at the American Academy of Music, were remarkable for their superior quality of tone and extraordinary power. Fine instruments we never heard. Clara Louise Kellogg, Annie Louise Cary, Zola Semini, Julia B. Rive, Esmeralda Cervantes, Joseph White, Max Maretzek, P. Brignoli, S. B. Mills, P. Ferranti, Franz Remmert, E. Beltracchi.

A matter which we would make most prominent in this connection is, that the Decker Brothers' name is the subject of attempts at counterfeiting. This is the penalty which the manufacturers of a first-class instrument have to pay for the gaining of a good name, and all our readers should be on their guard against imposition. Unprincipled parties have manufactured and sold cheap pianos under the names of "Decker," "Decker & Co.," "Decker & Brothers," "Becker Brothers," etc., doing business on the reputation and popularity of the celebrated Decker Brothers' pianos. All genuine Decker Brothers' pianos have their name in front on the pianos above the keys, viz.: Decker Brothers, New York. In all genuine Decker Brothers' square pianos the following words appear, cast upon the iron plate on the inner left-hand side of the instruments: Decker Brothers' patent, June 2d, 1863.

The simplest way to guard against imposition is to deal with those who are well known to be trustworthy. Kohler & Chase have a reputation of this character established by twenty years of business experience in this city.—*Pacific Rural Press*, Nov. 1st, 1877.

HYDRAULIC MINING.—The article on this subject from the pen of the well-known engineer, Ang. J. Bowie, Jr., which is now being published in the Press, is an especially valuable one, and our hydraulic mining friends will find it alone worth more than a year's subscription to the Press. The facts and figures given by Mr. Bowie are of great value as showing the results of practical work. A reliable article of this kind is more profitable for miners to read and study than any other class of literature. We advise those who do not usually file away the Press to commence keeping their numbers now and they will have this standard article as a whole. It has been carefully revised and corrected by Mr. Bowie and comprises the whole literature of hydraulic mining in California.

## METALS.

## To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

## PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where he principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY &amp; CO., Publishers.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

**Advance Silver Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Monitor District, Alpine County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the twenty-first day of November, A. D. 1877, an assessment of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 16, No. 309 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the eighth day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-sixth day of January, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

On the second day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the twenty-sixth day of January, 1878, at 2 P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

B. LINGLEY, Secy.  
 Office, Room 16, No. 309 California St., San Francisco, Cal.

## California and Oregon Land Company.

Location of principal place of business, San Francisco, Cal. Location of works, Jackson County, Oregon.

Notice.—There is delinquent upon the following described stock, on account of assessment No. 1, levied on the seventeenth day of October, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Certificate.	No. Shares.	Am't.
Allen, J. O., Administrator Estate of Isaac Allen.	98	500	\$175 00
Belcher, W. C.	48	500	175 00
Belcher, W. C.	49	500	175 00
Belcher, W. C.	50	500	175 00
Clark, J. W., Trustee.	125	1000	350 00

In accordance with law, and an order of the Board of Directors, made on the seventeenth day of October, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 2, No. 415 California Street, San Francisco, California, on Monday the twenty-fourth day of December, 1877, at the hour of two o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. CLARK, Secy.

## Manzanita Gold Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Sulphur Creek, Colusa County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the third day of December, 1877, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 51 Fremont Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the eighth day of January, 1878, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the third day of January, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

GEO. S. SPRATT, Secy.  
 Office, 51 Fremont Street, San Francisco, Cal.

## Merced Mining and Water Company.

Location of principal place of business, San Francisco, California. Location of works, Quartzburg Mining District, Mormon Bar, Mariposa County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the third day of December, 1877, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 51 Fremont Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the eighth day of January, 1878, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on Thursday, the third day of January, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

GEO. S. SPRATT, Secy.  
 Office, 51 Fremont Street, San Francisco, Cal.

And in accordance with law, and an order of the Board of Directors, made on the seventh day of October, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, No. 326 Pine Street, on the tenth day of December, 1877, at four o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

F. T. HOUGHTON, Secretary,  
 Office, No. 326 Pine Street, San Francisco, California.

## Attention, Mining Companies.

### RICKARD'S PATENT

### Oxidizing and Chloridizing

### FURNACE,

FOR ROASTING

### COPPER, SILVER & OTHER ORES

Prior to Leaching or Amalgamation.

The most striking advantages which it offers above all other recent inventions of this nature may be briefly summed up as follows:

First.—Its cheapness, the cost of its erection (ex-royalty and freight) not exceeding \$1,500, for a capacity to roast and chloridize twenty tons per day, viz: brick work, \$1,000, and iron work, including blower, \$500.

Second.—Short time required for erection, viz: 14 days, after providing all materials, with a sufficiency of labor.

Third.—No expensive, heavy or complicated machinery being necessary, involving heavy freight to the district where it may be required. Brick and clay generally obtainable on the spot, being the chief materials required in its construction.

Fourth.—No skilled labor or technical experience is necessary to work it. Two ordinary laborers being sufficient to attend to it when in full operation.

Fifth.—It does not easily get out of order, and is readily repaired by an ordinary mason or blacksmith when it does.

Sixth.—The royalty, or license to use it, is exceedingly moderate, removing thereby all temptation to evade or infringe the patent.

Seventh.—Calculating labor at \$3 per day, and wood at \$6 per cord, the cost of roasting is but little over \$1.50 per ton (ex-salt when chloridized), at these high California rates for labor and fuel.

One of them is now in the course of erection by the Aztec Gold and Silver Mining Company, at their mill in the Aztec District, Santa Rita mountains, Southern Arizona. At their office, 302 Montgomery Street, rooms 14 and 15, a model may be seen, and working drawings, with all further information necessary to enable any ordinary mason to construct the furnace, may be obtained from

COL. J. D. GRAHAM.

Pamphlets, with illustrations and full description, sent on application.

### THE O'HARRA

### CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:

One man.....	\$ 4 00
One mail.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2 1/2 cents.....	40 00

Cost of 20 tons.....\$52 25

Cost of one ton.....2 61 1/2

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in Peavine District, Nev., and at the Eschequer mill, Alpine Co., Cal. For further information, apply to

D. J. O'HARRA,

**FRED'K OGDEN, Sole Owner Tulloch Patent,**  
ROOM 72, NEVADA BLOCK.

Extract from a letter from C. G. Rodgers, Superintendent Green Mountain Mining Co., Plumas County, September 10th, 1877: After using both the Tulloch and Hendy Ore Feeders, side by side, for eight months, I can candidly say, that in my opinion, the Tulloch is much the best machine; it will feed any ore that can be fed by machinery; there is nothing about it to wear out, and should anything break, any blacksmith can repair it. Whereas, the Hendy machine is wearing from the moment it is started, and when any thing is worn out, or broken, you must have a machine shop or foundry to make the repairs. The Hendy Feeders are not in use at the Gold Stripe Mill; they were thrown out after a fair trial of some two weeks.

San Francisco Pioneer Screen Works,  
J. W. QUICK, MANUFACTURER.

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco

Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.

## \$1,000 Challenge Ore Feeder.

### HENDY'S \$1,000 CHALLENGE ORE FEEDER.

I call my Automatic Ore Feeder the \$1,000 Challenge, because I challenge the owners or backers of any other feeder to a competitive test for that amount. As Mr. C. O. Rodgers, Superintendent of the Green Mountain mine, near Greenville, Plumas county, appears prominently as a detractor of the merits of my feeder, and seems confident that another one is better, perhaps he will accept this long-standing challenge which the owners of other patents will not, and give me an opportunity to prove publicly the superiority of my machine. As to Mr. Rodgers' assertion about my feeder wearing out, it is no less fallible in that respect than other machinery; but I have over 250 now in use, some of them for over two years, and have never had to expend 25 cents for repairs. The fact that my feeder received the premium at the late Mechanics' fair, and that I am shipping several feeders weekly to different parts of the country, is sufficient proof of the appreciation in which it is held.

As to my feeders having been thrown out of the Gold Stripe mill, they were not displaced for inefficiency, as the following letter will show, and it answers also as a complete refutation of Mr. Rodgers' statement:

OFFICE SUPERINTENDENT OF THE GOLD STRIPE G. M. CO.,

GREENVILLE, PLUMAS CO., Oct. 16th, 1877.

JOSHUA HENDY, Esq.—Dear Sir:—Your favor of the 15th instant at hand. In reply to your inquiry as to the working of your ore feeders at our mill, we can say that there is no fault in the machines, and we consider them the best now in use. At present they are not in use with us, owing to the construction of the mill, which we are about to rebuild and make proper arrangements for putting in your feeders.

J. K. OWEN.

Superintendent Gold Stripe Mine.

One of the principal owners of the Gold Stripe and Green Mountain mills is also largely interested in the Plumas National mine, where I have just shipped several feeders, showing the confidence placed in the machine by these gentlemen who have used it.

Now, if Mr. Rodgers is sincere in his belief as to the merits of a rival machine over mine, here is a chance for him to make a thousand dollars easily, if he can get the owners of the machine to lend him one for the trial, which is the only doubtful thing in connection with the matter. Mr. Rodgers' eight months' experience with both machines ought to give him confidence enough in his own convictions to accept the challenge offered to him, or any one else.

JOSHUA HENDY.

Corner Fremont and Market Streets, San Francisco.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other the market, and will sell them as cheap as any other of its class.

## Mining and Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free.

"Faith and Confidence."

LIVERMORE, Oct. 1st, 1875.

Messrs. Dewey & Co., Patent Solicitors: Gentlemen—Yours of the 24th ult., containing my patent to Elevated R. R. duly received, and I hereby return my sincere thanks to the MINING AND SCIENTIFIC PRESS PATENT AGENCY for your promptness and honesty in regard to our business connections. I have received a flood of circulars from Eastern firms, desiring to deal with me, but I have declined any communication with them and prefer as soon as circumstances will permit, to negotiate with and patronize a home institution; one in which I have faith and confidence—Dewey & Co.

Again thanking you for your promptness in securing my patent, I remain, obediently yours,

W. M. H. HARRISON.

Thanks for Six Patents, Etc.

SACRAMENTO CITY, November 23, 1877.

Messrs. Dewey & Co.—Dear Sir:—Please accept my thanks for the prompt and successful manner with which you have conducted my business in obtaining patents for fire brick, and for a smelting and condensing furnace, making six patents I have obtained through your patent agency. Four of the above patents were for the purpose of saving fine gold, quicksilver and amalgam, and the concentration of ores of all kinds. I can cheerfully recommend the firm to all with whom I may come in contact, especially inventors. I remain, respectfully yours,

GEO. R. EVANS.

Any person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinued.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,  
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers, containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

### OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send one but worthy men.

J. L. THARP—San Francisco.  
B. W. CROWELL—California.  
A. C. KNOX—Pacific Coast.  
C. N. WEST—Santa Cruz, Monterey and San Benito counties.

A. C. CHAMBER—Tulare, Fresno and Inyo counties.  
JOSEPH DIMARCO—Mendocino, Humboldt and Del Norte counties, and Oregon.

W. D. WHITE—San Bernardino and Los Angeles counties.

J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.

B. E. LLOYD—Alameda, Contra Costa and Napa counties.

E. M. DENNY, Oregon.

F. B. ALDERSON, Nevada.

THE BEST FILEHOLDER.—After having used Dewey's patent elastic hinge fileholder for over a year past, the *News* cheerfully indorses it as the best newspaper fileholder in existence, possessing important advantages over any and all others in use. The holders are neat, light and convenient, and the newspapers are placed in them with the utmost facility and least possible time and exertion. They are the simplest, handiest and cheapest of all. Anybody keeping files of papers in reading rooms, offices or at home, should send at once to the proprietor, A. T. Dewey, San Francisco, and get the only proper fileholder. Samples by mail fifty cents.—*Gold Hill News*.

## MINING LAWS AND DECISIONS.

### Copp's Hand Book of Mining Laws.

In this little work is given the United States Mining Laws and Instructions. Also, a digest of the decisions under the laws, by the Secretary of the Interior and Commissioner of the General Land Office.

Forms are given for making out notice of location, proof of labor, application for survey, and in fact all the blanks a miner needs.

There is also a list of all the mines for which U. S. Patents have been obtained from July, 1863, to August, 1877, with location, township and range.

A handy companion for miners. Price \$1, post paid. Address

DEWEY & CO.,  
202 Sansome Street, S. F.

## Amusements.

### GRAND OPERA HOUSE.

Mission Street. . . . . Between Third and Fourth.

M. A. KENNEDY, Acting Manager.

Open every evening with a first-class dramatic company. Box office open from 9 A. M. to 10 P. M. Doors open at half past seven. Commence at eight.

### CALIFORNIA THEATER.

JOHN McCULLOUGH. . . . . Proprietor and Manager.

BARTON HILL. . . . . Acting Manager.

Bush Street, above Kearny. Open every evening with the best dramatic company in the United States. Box office open from 9 A. M. to 10 P. M. Seats may be secured six days in advance.

### BUSH STREET THEATER.

CHAS. E. LOCREE. . . . . Lessee and Manager.

FRANK LAWLER. . . . . Acting Manager.

Open every evening and Saturday matinee.

### KIRALFY'S COMBINATION,

Introducing the grand ballet. Seats may be secured six days in advance.

### BALDWIN'S THEATER.

THOMAS MAGUIRE. . . . . Manager.

Corner Market and Powell Streets. Open every evening and Saturday matinee. Union Square theater company. Magnificent scenery; elegant appointments. Box office open daily.

## PACIFIC MAIL STEAMSHIP CO.

The Company's Steamers will sail as follows, at 12 M.:  
ALASKA. . . . . JANUARY 1.  
For YOKOHAMA and HONGKONG.

SOUTH CAROLINA. . . . . DECEMBER 15.

For PANAMA and NEW YORK, calling at Mazatlan, San Blas, Manzanillo and Acapulco—connecting at Acapulco with Company's Steamer for all Central American ports.

Tickets to and from Europe by any line for sale at the lowest rates.

ZEALANDIA, MONDAY, DECEMBER 31, at 12 o'clock, noon, or on arrival of the English Mails, for HONOLULU, AUCKLAND and SYDNEY.

\$10 additional is charged for passage in Upper Saloon.

CITY OF PANAMA. . . . . DECEMBER . . . . .  
For Victoria, Port Townsend, Seattle, and Tacoma, connecting at Tacoma with Northern Pacific Railroad for Portland, Oregon.

Tickets must be purchased before 11 A. M. on day of sailing.

For freight or passage apply at the office corner First and Brannan streets.

WILLIAMS, BLANCHARD & CO., Agts.

\$1,500.

Any person wishing to make a good investment of the above sum in a well promising legitimate mining enterprise in California, will be directed to the parties wishing to sell upon addressing this office.

Engraving done at this office.

## Mine Locomotives for Gold Mines.

Description of the Mine Locomotive used by the Bald Mountain Gold Mining Co.

We present in this issue engravings of a mine locomotive which is now in use at the mines of the Bald Mountain gold mining company, at Forest City, California. It is employed in a tunnel 4,000 feet in length, in which is a track of only 20" gauge, laid with T rails, and having grades some of which are as steep as 220 feet per mile. The tunnel is four feet wide at the track and for 18 inches up; thence it tapers to two and one-half feet in width at the top. The extreme height from level of rails to the top of tunnel is five and one-half feet. The track has curves of from 60 to 150 feet radius. Small four-wheeled cars, having wheels 12 inches in diameter, and a wheel base of 20 inches, and which weigh 750 pounds each, and can carry two tons each, are used on this track. The ventilation is obtained from air shafts and air ways, without any blowers or furnaces, the current of air moving at the rate of about four miles per hour.

In the summer of 1876, Mr. H. W. Wallis, in behalf of the Bald Mountain gold mining company, opened a correspondence with the Baldwin Locomotive Works, of Philadelphia, with reference to a mine locomotive for working on this track. His requisition was for a locomotive to work by compressed air, if possible, some fears being entertained as to the practicability of working a coal burning locomotive, on account of the effect of the gasses on the ventilation. The Baldwin Locomotive Works, believing from their experience in the construction of mine locomotives for underground work in the coal mines of Pennsylvania, that a locomotive burning anthracite coal would be unobjectionable in the tunnel of the Bald Mountain mine, in view of the ventilation as described above, recommended such a machine for the purpose. They undertook to construct a locomotive which could haul 30 or 40 empty cars up the maximum grade in the tunnel, which was then assumed to be only 166 feet per mile. They estimated its consumption of fuel would be from 400 to 500 pounds of coal daily in hauling a total of 192 cars up the grade in eight hours.

The locomotive was ordered, constructed, and shipped in October, 1876. It reached its destination, and began service December 8th, 1876. The results of its work are fully and carefully stated in a letter from Mr. H. W. Wallis, of the Bald Mountain mining company, to Messrs. Burnham, Parry, Williams & Co., of Philadelphia, which we print below. The dimensions of the locomotive are mostly shown in the engraving. We add the following particulars of this engine: Cylinders, 8" x 12"; diameter of driving wheels, 24"; wheel base, 3 ft. 4"; tank capacity, 110 gallons; weight, in working order, 15,000 pounds; height, 61"; width across cylinders, 46 1/2"; width across tank, 39".

OFFICE BALD MOUNTAIN GOLD MINING CO.,  
FOREST CITY, CAL., May 13th, 1877.  
Messrs. Burnham, Parry, Williams & Co.—  
Gentlemen:—Your note making inquiry regarding the working of the mine locomotive built by you for us last fall has remained for some length of time unanswered, for the reason that our haul was too short to give a fair statement of its capacity. I am now able to furnish a statement of its work, although it is capable of doing twice the work which we have for it.

The locomotive has given entire satisfaction,

working completely in every respect; in fact, it is what engineers call a remarkably smart one, running since we had it without any repairs excepting replacing the cylinder heads, which were too tight. We find the tires too soft, causing them to wear rapidly. The estimates made by you were under its capacity, and cost of operating. We can haul 45 of our cars with 80 men and 10 loads of timber and material, up our grade and into the mine, making the trip in five minutes, or at the rate of nine miles per hour. We can bring out 18 loaded cars with the locomotive alone, with the use of the brake which we put on here. We have no brakemen. We use anthracite coal, and find no deleterious effects from steam or gas on our ventilation. Our air shaft is sunk 2,000 feet from the mouth of the tunnel, and is in two compartments of 3 1/2 feet square each. At the top we drop two inches of water into the center of each compartment, which forces a strong

Cost per car-load, 4 1/2 cts.—2 3/4 cts. per ton; distance run, not including switching, 200 miles; mule power costs 9 cts. per car-load; man power costs 21 cents per car-load.

H. W. WALLIS.

In relation to the above facts we are told that the locomotive described is of the greatest utility, and fills a want long felt amongst miners, viz.: the economic and rapid moving of large quantities of pay gravel through long tunnels. This engine is so constructed that it will work well in any ordinary sized tunnel and on heavy grades, where mule power is impracticable, on account of the number of brakemen required. The machine will be extremely useful in any mine with a 2,000-foot tunnel, and moving any considerable amount of dirt. Any further information concerning these locomotives

## Wealth—A Few Thoughts for the Times.

[Written for the Press by J. L. BOONE.]

We can write down as one of the laws of nature the following maxim: "Let every man succeed according to his talents." If a man is naturally endowed with superior talent in one direction, he is capable of accomplishing more in that direction than his less gifted neighbor or competitor. Natural capacity counts more in the race of life than education, practice or hard work. It is when all four of these requirements are combined in one individual, to a greater or less extent, that he becomes powerful, brilliant and a leader of his fellows in his business or profession. Take a Digger Indian that has talent in any direction, give him education, experience and a will to succeed and he will succeed. Education, experience or hard work will accomplish much separately, but they must be kept at the work to retain what they gain, otherwise it will gradually slip away. You can fill a sieve with sand if you keep at work and pile it in fast enough, but stop the accumulation a moment and the sieve is as empty as it was before. Divide the riches of the world equally amongst the people, regardless of their capacity, and, like water seeking its level, it will concentrate itself again into the very hands that now hold it. Why? Because it requires a special talent to accumulate money, and the best indication of that development

is the fact that these persons once accumulated it. Again, the capacity of an individual to accumulate riches is not so much in his superior faculty for getting hold of money as it is in his superior faculty for keeping what he does get hold of. In other words, he is a sieve with an imperforate bottom, every drop of sand that enters remains. Such a nature must necessarily be mean and sordid to a certain extent, for every generous action, every Christian impulse, makes a hole in the bottom of his sieve, and his accumulations begin to run out.

Rich to-day, poor to-morrow, is the motto of the energetic hard worker who is deficient in the talent or natural capacity to get rich. How many 49ers, who accumulated upon their perforated sieve bottoms large fortunes when gold dust was measured in quart cups, and 20-dollar pieces were used as convenient pebbles for throwing at a mark, retained what they had accumulated when the supply became less plenty. Extravagance, shiftlessness, passion and vice are all enemies of the rich man; so are charities and social pleasures. It is a common saying that such and such men are rich in spite of themselves, that they spend their money freely, but always seem to have enough. Fortune is fickle. It does, sometimes, seem to favor certain individuals, but hold on for a while, the end must come, and it always does come. Such fortunate individuals in the end are usually the most unfortunate. Luck is a favorite term. Many, like the ancient mythologists, have planted a star in the firmament which they call "Luck," and to it they how down as to a god. They pray for luck. Luck is a cowardly assassin. It is a sneak thief, the devil's assistant. It is a reward to the underserving, a blessing to the accursed. The hope of luck creates misery, damns souls and disorganizes society. Out with it. The sweat of an honest brow brings profit, an easy conscience, charity, good will toward our fellows, and learns us to appreciate its fruits so that our sieve has enough perforations to accomplish good, but is imperforate enough to contain all the balance.

MINE LOCOMOTIVE MADE AT THE BALDWIN LOCOMOTIVE WORKS.

current of air down the shaft and through the air-ways, giving the air to the workmen first and carrying off the steam and what little gas is generated from the coal. We have already made a saving of more than the cost of the locomotive and attending expenses in the working of the mine.

The following is a statement for the week of

End View of Locomotive.

six days now closed, which is a fair comparison with all of the work:

Length of haul, 3,800 feet; grade, 166 to 220 feet per mile; weight of cars, 750 pounds each; diameter wheels, 12 inches; wheel base 20 inches; gauge of track, 20 inches; cars each carry two tons; carloads gravel taken out for week 2,936=5,872 tons

4,370 pounds Anthracite coal	.....	\$87 40
Engineer's wages	.....	48 00
Head lights, oil and tallow	.....	4 10
Total	.....	\$139 50

tives will no doubt be furnished by the manufacturers to any one addressing them.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: California, Dec. 6th, \$339,530.81; Chollar-Potosi, 5th, \$10,019.87; Con. Virginia, 6th, \$238,002.62; Tybo, 6th, \$4,078.14; Grand Prize, 11th, \$18,300; Alps, 10th, \$3,056; Standard, 8th, \$39,425.92; Martin White, 10th, \$17,084; Northern Belle, 8th, \$2,

Section of Mine Locomotive.

606.10; Leopard, 11th, \$5,900; Tybo, 8th, \$8,313.79; Alps, 11th, \$1,300; Arizona, 11th, \$1,623.12; Con. Virginia, 11th, \$405,488.06.

At Santiago, Chile, a perfect shower of lawsuits are pending, instituted by purchasers of the Paraf shares, to recover their money, on the ground that the alleged discovery being untrue, there was no consideration given, and that, consequently, the sales were void. Some of these suits are said to be already compromised. Paraf is in jail.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### Mechanical Ore Concentration.

EDITORS PRESS:—Mr. F. M. F. Cazin, in replying to my article on the Hendy concentrator, takes issue with my views on the subject in a sense not aimed at when my invitation for discussion and criticism was made. Such invitation was incorporated with my article, because of a sense of the fallibility of individual opinions on complex subjects and the difficulty of expressing them briefly in such a manner as to be correctly understood by others. The mind, preoccupied by a certain train of thought, is prone to pass by unheeded points of importance, and individual experience on any practical operation is never exhaustive in details, no matter how extensive it may be. The hope of getting nearer the truth by the views of others was the main incentive in inviting discussion so "pointedly," and I admit that I speculated no little thereby on the extensive theoretical and practical knowledge of which I know Mr. Cazin to be possessed.

That Mr. Cazin did not enter into the details of principles elucidated by me, but devoted so much of his remarks to a generalizing tirade against Mr. Hendy, I regret, for the elucidation of those principles was the main object of my article, as the heading of it indicates. I would have preferred to learn in what details I really am at fault, for in the matter selected by him for particular criticism, we are essentially not at variance, if Mr. Cazin will give my language its full significance and if he will view my remarks in the light of my expressions in previous contributions to the PRESS.

With the defense of Mr. Hendy's course as an inventor, I have nothing to do. In my opinion, Mr. H. acted wisely in devoting himself to the perfecting of one machine, of whose merits and demerits he had ample practical opportunity to inform himself, and in leaving to competition the successful introduction of others, which have been proved useful under conditions so different, and in localities so remote, that Mr. Hendy could have no sufficient opportunity to assure himself by independent observation of their excellence. Mr. Hendy has been a successful inventor and has the caution in accepting things new to him which an intelligent inventor's experience is sure to teach. If Mr. Hendy has naturally been an earnest advocate of his meritorious invention, it does not therefore follow that the latter is to be considered a panacea for all requirements of mechanical ore concentration and that he or anyone else recognizing the merits of his machine therefore rejects such others, "as for limited action in proper places are far superior and more reliable." If Mr. Hendy does not recognize the merits of such other machines for such specified purposes, it, no doubt, is because the peculiar conditions of the art in this country have not given him the opportunity of seeing these claims verified by successful application here.

In so far as the article in question is calculated to foster such one-sided views, it can only do so in the case of inattentive or prejudiced readers, for its whole bent is to circumscribe the limits of action most favorable to the working of the Hendy pan, and the very machines referred to by Mr. Cazin "for limited action in proper places," are recommended by him for such action in such places, as desirable auxiliaries to the operation with the Hendy pan. In this connection I may state that among the many constructions for sand jiggers, Mr. Cazin's is one of the simplest and best, though there are others which will answer the same purpose no less satisfactorily in every respect.

As for Mr. Cazin's classification of machinery, the principles which he sets up for the distinction of good and objectionable machinery have my full approval, but I insist that his own designations of successful qualities would place the Hendy pan in the foremost rank of useful concentrating machines. Its construction is as simple as that of any automatic machine of the same capacity in actual use which can be produced as suitable for the same work, and is sufficient if reasonable and timely attention is paid to it. That its merits are permanent is amply attested by the length of time during which it has been before the mining public and the signal manner in which it has outlived many competitors, also by the fact that many of our most important mills, in which they have been for years in constant use, retain them and will continue to use them.

It does not follow, that because the theoretical explanation of the action is complex that the practical application is necessarily so, for not every detail of action needs special attention, because many of them combined can be the effect of a leading cause, such as, for instance, speed of motion and volume of pulp, etc. The successful use of any machine requires the presence of a number of indispensable conditions, which accounts for the difference of success in the use of them. The number of such conditions for the successful working of the Hendy pan is not greater than is the case with any of the machines which Mr. Cazin has described, for I am practically acquainted with the working of every one of them, except his one-plunger jig.

I can also assure Mr. Cazin that scores of Mr. Hendy's machines are worked in this State and elsewhere by men who never had any instruction from Mr. Hendy, and that they do the work permanently, persistently, and smoothly, nevertheless. The regulation is not difficult, because it admits of considerable license, and the repairs are attended with no more difficulty than in the case of any other automatic concentrating machine. What I claim for the machine, principally, is its financial success under certain conditions, which is even more marked than its technical one, for the reasons amply explained in my article. Mr. Cazin can form a conception of this when I assure him that a 40-stamp mill, crushing 80 tons ore per 24 hours, and running all the pulp through Hendy's pans (after amalgamation in the battery and on copper plate outside) requires the services of only four laborers in 24 hours to keep 22 Hendy's running permanently, persistently, and smoothly; attending at the same time to all regulations and repair, and performing all other work connected therewith. I doubt that the yield could be profitably increased to any considerable extent, and positively assert that no machinery or combination of machinery which Mr. Cazin has described, could be substituted to do the work with same ultimate economy.

But all this does not make the Hendy a panacea for all purposes, but merely aspires to do what Mr. Cazin would have us, *i. e.*, giving to each machine its proper sphere of work. I have drawn the limit plainly, suggested the proper substitutes outside of these limits, and broadly defined my position and claims by the expression: Introducing the treatment for coarse stuff suggested, and perhaps, also that for the finest in the case of rich sulphurets, I will say, that of all the concentrating machines at present in successful practical use for wet concentration, either in Europe or America, none will effect the concentration of medium grade sands, under the peculiar conditions presented in our amalgamating stamp mills, with equal ultimate economy, as the Hendy in its present form, when properly used; and none of them can compete with it in the effectual working of unsized and ungraded sand, where systematic concentration, by reason of the nature of the ore, cannot be made the leading consideration in the treatment.

Coming to the discussion of those points of my article particularly objected to by Mr. Cazin, I beg leave to say that I fail to see in his exposition a proof that the science of mechanical ore concentration has emancipated itself from the nomenclature with which Rittinger more or less labeled, or that the search of the intelligent mind for the reason why, the rational elucidation of phenomena seeking cause for effect, the theoretical origin of actions, at all interferes with the more important attention to practical purposes, or that it holds, or ever will hold, any other relation to it than does theory to practice in any other technical question or pursuit. I must admit, that I cannot fully comprehend Mr. Cazin's meaning in the paragraph here referred.

The attempt to translate the idioms of another language naturally leads to various expressions by different translators. If usage accept "equal falling" as the best definition of the German word "*gleichförmig*," I am satisfied, though the English expression may be styled a Germanized one. From the first I chose to call the particles so treated "graded," the action "grading," and the apparatus used thereto "graders," because the word, in my opinion, presented the briefest expression to indicate the prominent characteristic of the material, etc., to which it was applied. The term "water sizing" has also been used—in some cases simply "sizing." To this latter expression I object, because the word conveys the idea that size, or approximate equality of size, is the prominent characteristic of its action. This term was found more applicable to the work of graduated sieves, or classification was used synonymously to approach more nearly the nomenclature of Rittinger. In this sense the terms are used throughout all my articles on concentration, for want of any authoritative English expression for the same purpose.

To be a little more explicit, but to avoid a full explanation, as not relevant to the subject. I defined graded "particles assorted according to their equivalent speed of fall in water." This expression Mr. Cazin criticises as if reading: According to their *equal* speed of fall in water. I insist on the use of my words, and emphatically object to the substitution of the word equal for the word equivalent, and if Mr. Cazin has any valuation of the English language he will sustain my objection. Not equal speed is the distinction, but such speeds of the particles as are equivalent to the attainment of a certain end or effect, *i. e.*, the sinking of the particles to and below a certain depth within a given time. That I am aware of the differences of initial speed, no one can doubt that reads my article attentively, for on this ground, among others, the separation in the Hendy pan is explained. It is also intimated by mentioning its cause in speaking of fine sand jiggers in my article, "Krom vs. Rittinger," PRESS 1876, page 2. Moreover, any one can amply inform himself in the matter by consulting Rittinger's Appendix I, 1870, page 18. The subject is there more thoroughly treated than in Mr. Cazin's treatise in the MINING AND SCIENTIFIC PRESS, May 5th, 1877, and to the information there given by Rittinger, Mr. Cazin and "the trade," so far as I can learn, has added nothing new. Professional theory has therefore not to yield to governing practice, and common sense is not

in favor of the laborer and contrary to the scientist, as Mr. Cazin so pointedly puts it, for in this matter they are not at variance; many years have passed since they were elucidated by theory and verified by practical experiment conjointly, this being the basis on which nearly all of Rittinger's doctrines have been built up. If any one man ever had superlative ability for elucidating theory in these matters, and at the same time extraordinary facilities for verifying it by practical observation and careful, systematized experimentation, it was Rittinger, and for this reason his opinions are justly considered authoritative. To claim his views as *sole authority*, and to consider his opinions unconditionally correct in all things relating to concentration, even, would be presuming an infallibility which I refuse to recognize as within the reach of the human mind.

If I am not mistaken in the hints, Mr. Cazin would have me looked upon as a scientific theorist in the art of concentration. If this be so, let me assure Mr. Cazin that I can give him ample reference regarding my *practical* experience and ability in this line.

As objectionable in my article, Mr. Cazin further cites the expression, "It has been accepted as an axiom *almost* in rational concentration that sizing or grading of the material is absolutely necessary to effect a good separation with any concentrating machine." If I am not mistaken in the weight of English words, this is far from being a generality. It does not express that it has always been, or is, or everywhere has been accepted as an axiom, unconditionally, but *almost*, to effect a good separation. As for the example which Mr. Cazin gives to sustain his objection, he might have chosen one more to the point, because of practical importance, by taking the case of separation with quicksilver, instead of referring vaguely\* to the use of zinc vitriol solution (or another salt solution, susceptible of high density), which latter, for obvious reasons, though serving as interesting experiments, have little or no practical value.

In writing my article, it was not my aim to branch out on every detail, but I chose to intimate instead, where not expressed, conditions qualifying, as briefly as possible, by the turn of words, thus paying more attention "to practical purposes." If, therefore, the axiom, as Mr. Cazin says, is not a general one—which I do not claim it to be—it is sufficient for us to have his assurance that "it is such for all successful apparatuses in actual use," for these are the ones with which we deal.

CHAS. C. RUEGER.

Benicia, Cal., Dec. 2d, 1877.

\* I am very much interested to learn of Mr. Cazin what medium he does refer to, for such an one above 1.59 Sp. gr. (excepting quicksilver) is unknown to me.

### Arizona Mines.

EDITORS PRESS:—I will not, at the present writing, attempt any detailed account of the mines and mining interests in this Territory, nor say much about any particular property or locality, but give merely such information of a general kind as I have been able to pick up in regard to the condition and prospect of things here since my arrival in June last. There is, as you have no doubt observed, a constant disposition among mining men to Compare Arizona with the State of Nevada; A very natural and proper thing to do, considering that they are both great mineral bearing countries, and that of the latter we already possess a good deal of practical knowledge. This knowledge of the older we like to apply to the newer region, both as a means of avoiding former mistakes and furthering the work of its physical development. In their climate, topography and agricultural resources the two countries are not widely unlike. Here, as in Nevada, climatic differences depend greatly on altitude, the low lying plateaus, desert plains and river valleys being hot in summer, and free from snow at all seasons, while at greater elevations the summer temperature is moderate, some snow falling in the winter, the summits of the higher mountains being covered with snow for five or six months in the year, and in a few instances the whole year round. With these variations, the climate here is, at corresponding altitudes, from five to ten degrees warmer than in most parts of Nevada, there being a considerable area in the southern portion of that State depressed below the sea level, which has an almost tropical climate. Our rainfall occurs mostly during the summer months, and is usually quite heavy. In Nevada they have frequent showers in the summer, confined, chiefly, to the mountains, but the precipitation takes place there mostly in the spring, or in the form of snow during the fall and winter. On an average, a greater amount of water falls here than in that State, and, coming in the summer, is of more benefit to the growing crops.

#### The Topography of Both Countries

It is marked by long chains of nearly parallel mountains, with a generally north and south trend, and separated by a series of alternating valleys, the latter spreading out often into great plains, and forming the desert lands characteristic of both regions. The most of the mountains consist of high, narrow ridges, though they are sometimes broken up, forming a broad belt of straggling ranges, or flatten out into vast arid and timberless meads. We do not find here, however, the tall mountains proper, such as are seen in certain parts of California. In the more southerly part of Arizona this system of alternating mountains and valleys is by no means so well preserved as in northern and

central Nevada. Here, as there, the timber is usually found in the mountains, only cottonwood, mesquite and willow being met with elsewhere. A greater variety of woods grow here than in the Silver State, and, generally, our timber is more widely distributed and of a better quality. We have fewer of the alkali flats and mud lakes, and none of the "sinks" that form a peculiar feature of that region. In their place, however, we have the tremendous canyons of the upper Colorado, gorges hardly equaled elsewhere in nature, while we can boast of at least one navigable river skirting our borders. In fact, as regards

#### Rivers, Springs and Mountain Streams

We are able to make a much better showing than our northern neighbors. The Colorado, which, after crossing the entire northern part of the Territory, forms its whole western border, carries during the summer an immense volume of water and is at all times a river of respectable magnitude, being even at its lowest stages navigable for 500 miles or more. After passing 100 miles east of this river the mountains abound with running streams, many of them large and never failing, the water always of the purest kind.

#### As a Grazing and Farming Country

Arizona is much ahead of Nevada, there being here a large scope of good agricultural land, while the grasses are varied in kind, perennial and abundant. For sheep and stock raising this is one of the best regions west of the Rocky mountains, pasturage being plentiful and the climate mild and healthful. In process of time, our flocks and herds will constitute a source of wealth second only to that afforded by

#### Our Mines.

Of which I can in this letter say but little. That we have not in this department of industry been able to make a larger production than has yet been done has not been so much the fault of the mines as of other and extrinsic causes, chief of which has been the lack of means to open them up and outfit them with suitable reduction works. Notwithstanding the good showing of rich ores our mines have made during the past year, but little outside aid has yet been extended to them. What little money has been invested here has been mostly in the purchase of mines, not half a dozen of mills having meantime been brought into the Territory. What we most need just now is a little money to help open up some of the rich ledges that exist here. The amount need not be large, as enough ore could in most cases be taken out, when once tools, supplies and hoisting works were on the ground, to defray current expenses. Without a dime to his name, the miner, however rich his claims, can do nothing, and these men are always willing to give to parties furnishing money to prospect their lodes a liberal interest therein. If only we could have the assessments paid on half a dozen unproductive Comstock claims scattered over two or three of the best districts here, it would be pretty sure to reward the investors many hundred fold.

#### What We Want and What We Can Do.

In the more recent immigration only three classes of men have come to Arizona: The laboring man without means, the speculator, intent on securing any sort of property for gambling purposes, and the capitalist or his agent seeking to buy a valuable mine for a nominal price. Let now the capitalist or his agent come here, and, taking his time, look about, and when he sees anything that suits him act in a spirit of liberality and fairness, and he need not go away without getting properties that will turn out satisfactory in the end. He can extract the ores himself, select his samples and have them tested by our local assayers, of whom we have here several that stand at the head of their profession. In this town we have a number, all thoroughly competent, some of them being skilled metallurgists and chemists as well. At Pickett Post, near the Silver King mine, Prof. Henry Degroot, Jr., has opened an assay office, whereat he is doing a large business, this being an important mining center where an establishment of the kind was much needed. This young man has become very popular with our mining community, he being not only a capable and trustworthy assayer but possessing in addition that intuitive knowledge of ores that enables him to indicate the methods best suited for their reduction, a faculty that renders him doubly useful in his calling. Not only can parties have their ores well assayed here, but they can obtain small lots to be worked, if they desire it, making all required tests on the ground. To men who have even a little money and think of embarking in mining; this is, above all others, the place to come to. There are more ledges in the Pioneer and Globe districts showing rich ores on the surface than have ever been found in the whole State of Nevada. Parties coming here need not buy these properties outright. They can bond them, buy them conditionally, get them, in fact, on almost any terms they choose to propose, having all the time they want to prospect and open them up.

We may not succeed in developing down this way another Comstock. What is even more certain we shall not spend millions upon millions and impoverish multitudes of people in looking for ore. If we do not find here lodes that will give vast wealth to a few we shall surely find those that will bring moderate enrichment to many, thereby increasing that stable and well-to-do element that forms the mainstay of every community. A good word from our friends and a little cash from almost any quarter is what we most want just now.

I. L. M.

## MECHANICAL PROGRESS.

## Making Miners' Tools.

Mr. R. Goldsworthy has been awarded a prize for the best essay on mining machinery by an English society. We take from the essay the following hints. In the making of borers, the best borer steel should be used, which will be found the most economical in the end and is fast superseding the iron bar with steeled end. These borers may be of less diameter and being more rigid will transmit the blow with greater force and are more easily carried about the mine. They should be annealed at the striking end to prevent flying and splitting. Foul blows and irregular turning will do more damage to the tools than anything else, and this should be observed, that the fault may not be attributed to the smith. Good coal is also a necessary adjunct to the work of the smith and the making and keeping in repair of steel tools. Dirty coal no doubt injures the composition of the steel and its best qualities are somewhat impaired. For boring in very hard ground the bit may be tempered to a straw color; for mild ground, to a bright blue.

If mallets are made from rolled bar iron, care must be taken that the eye is not punched with the grain but across it. Fagotted iron bars are now mostly used and sold at the various manufacturing, with scrap iron hammered to all sizes and for all uses. This iron will punch any way and the mallets never split or crack as when made in rolled iron, but solid cast-steel sledges, mallets, hammers, borers and picks, etc., are now easily procured and will be found the most economical in the long run. If purchased of a good manufacturer and receiving fair usage they are exceedingly durable. It is not necessary to enumerate the many forms now in use, with their names, dimensions and weights; they are well known and need but ordinary care to make them. Let the eye be punched quite true, that the shaft may set square, and, if possible, tempered under a running stream of clean water.

The pick is the handiest tool the miner has. Made well, properly set and used with skill, there is no more valuable tool the miner can carry to his labors. Many forms have been used for various kinds of work and different character of ground, but the Cornish poll picks, as made for hard and soft ground respectively, are good tools for the metalliferous miner, with the exception of the eye, which might be improved perhaps by making it twice as deep, that it may obtain a firmer hold on the shaft, making it a stronger lever and prevent it from winching, more compact and not liable to become loose. This can be effected by purchasing the iron drawn from the hammer to form, leaving a thick lump for the eye. The molds might also be forced into a die, having a drift fixed in same, and punch the eye nearly through, thus facilitating the work of the smith very much and the difference in cost—taking a gross of picks through to the finish—should not be felt. The picks and shafts would stand a great deal more wear and render strapping the handles and numerous other devices for fixing the same unnecessary.

Shovels should all be plated or hammered from best selected scrap iron, which process of manufacture alone will insure a good quality of iron, and being steeled with the best steel, leaves nothing to be desired.

## The Age of Steel.

Mr. Lowthian Bell, the English expert, is well known to be of the opinion that the age of iron is approaching its close, and that steel will eventually take its place; and the object upon which the energies of that gentleman have for some time been concentrated is to produce steel from the puddling furnace by a direct process. He candidly told his hearers at Newcastle that "two-a-days, so far as anterior products were concerned, it was neither bar iron nor pig iron they required, but steel; and, however their interests might deceive them into the belief that malleable iron was going to retain the position it had occupied for some thousands of years, there was no doubt in his mind that steel was destined to supplant it." It cannot be ignored, says the London *Telegraph*, that, at least as regards rails, the hulls and boilers of metal ships, and many other articles, patent facts yield increasing support to the forecast of Mr. Lowthian Bell. In consequence of the increasing preference given to steel for rails, the iron rail trade of South Wales and Middlesborough has almost entirely disappeared. When railway companies renew their permanent way, if it should happen to have been formerly laid with iron, they now invariably substitute steel, for the sufficient reason that rails of the latter metal will wear three or four times longer than those made of the former, notwithstanding that steel rails cost only 10 shillings per ton more than iron ones. Besides, Floyd's have already sanctioned the construction of steel ships at a reduction of 25% on the stantling required in the case of iron vessels; and the advantages in favor of steel, in respect of durability, lightness and capacity for accommodating freight, are self-evident. Steel bridges span the great rivers of America and the dykes of Holland,

and it cannot be long before the security of this material for similar purposes in England is generally recognized. There is, however, an important consideration which, in a commercial point of view, might be regarded as a drawback to the displacement of iron by steel. If, for example, steel rails will last 16 years instead of four—the average duration of iron rails—and if steel vessels last proportionately long, it is obvious that, unless enterprise in these departments develops on a scale vast beyond anticipation, the greater durability of the one metal, as compared with the other, will prevent orders from being so frequently repeated for replacing wasted material.

## Encouragement to Poor Inventors.

Every movement which enables poor but worthy inventors to bring forward the results of their labor for public study, is worthy of praise, and is an agency toward mechanical progress. We are much interested in reading in an English exchange of the "Inventors' Institute," which was organized for promoting and protecting the interests of the less wealthy class of inventors intending to offer evidence of their ingenuity at the International exhibition of 1882. The late Mr. R. Marsden Latham conceived the happy idea of inaugurating an institute which should bring together the previously divided and not very satisfied class—inventors—in such a manner that all should be led to comprehend that they had many interests in common, and that it was to their mutual advantage to act in concert. In a very short time the list of members, under the presidency of Sir David Brewster, included a large proportion of the leading inventors of the country, Whitworth, Bessemer, Siemens, Varley, and others of equal repute, occupying positions in the council. Sir David Brewster, and several other warm supporters of the Institute, have passed away, and others have grown too old to take the same active part in the business of the society as formerly, but in the secretaryship the original founder has been succeeded by his colleague, Mr. F. W. Campin, who is equally well acquainted with the requirements of the members, and thus the Inventors' Institute retains vitality, and will inaugurate its 16th annual session at the rooms of the Royal Society of Literature, Charing-Cross, on November 29th, under the presidency of Sir Antonio Brady, J. P., F. G. S., who has ever been recognized as a warm advocate of inventors' rights, and who, during the time he has occupied his present position, has given great satisfaction to the members from the energy he has displayed in connection with every movement on their behalf, and on behalf of inventors in general. It is but reasonable to anticipate that in view of the forthcoming International exhibition at Paris, the numerical strength of the Institute will largely increase, as it is not unreasonably suggested that whatever may be the advantage of membership in connection with international exhibitions in England, it must be far greater in connection with those in countries the language and customs of which are different.

ADJUSTABLE JOURNALS FOR CURVES.—At a late meeting of mechanical engineers in England, Mr. H. W. Widmark described a new device, which afforded a means for the lateral and radial motion of the axle of locomotives while running round curves in the road. The following is a description of this design. Each pair of guides—always cast in one piece, whether fixed to the main frames of the engine or to cross frames—is distinct from the other and is bored to a cylindrical surface, the axis of which is in the same line as the spring pillar. An intermediate guide or box, the outer surface of which is turned so as to fit easily in the outer guide, can have a turning motion round its axis and also an up and down motion, as may be required by the elasticity of the springs or the roughness of the road. The axle-box has planed parallel sides and is free to slide in a direction which is rectilinear and horizontal but inclined to the axle of the wheels. The box at the opposite end of the axle is inclined in the opposite direction; so that, when the wheels and axles deviate towards one side in consequence of the curvature of the road, the axle is simultaneously set in an oblique position to the engine frame but radial to the road, one end being advanced in relation to the frame whilst the other is drawn back by the inclined form of the axle-boxes and the intermediate guides. Moreover, the axle-boxes are free to turn round a horizontal axis, which is at right angles to these side planes. Thus one axle-box may rise and the other fall in the guides, as required by the state of the road. In the writer's design each axle-box system becomes a universal joint, for there is a vertical turning of the inside guide in the outer one, a horizontal turning of the axle-box in the inner guide and also, of course, the turning of the axle-box round the axle; thus there is no possibility of the axle becoming jammed in the guides. As in this design the axle-box travels in a direction which is rectilinear, it is easy to arrange inclined planes on the top of the box and corresponding inclined planes on a sliding piece which is held by the inner guide and takes the thrust of the spring. By this means an elasticity is given to the axle or a tendency to come back to a central position when not constrained by the curvature of the line.

## SCIENTIFIC PROGRESS.

## The Color and Fragrance of Flowers.

Prof Vogel discourses pleasantly on "The Color and Fragrance of Flowers" in the *International Review*, wherein he says: "The chemical transformations in the bodies of living plants, by which the most manifold and brilliant colors are produced, are almost entirely unknown to us. We see a flower pass through the entire scale of red, from the softest pink to the darkest purple-brown; but can give no explanation whatever of the mysterious process. We know, for instance, that the light of the sun greatly influences the color of living plants, and experience has taught us that in most cases its total exclusion is equivalent to the absence of every color; in other words, that it produces white leaves and blossoms. However, this rule is by no means without exception, as many roots, the roots of *Alcanna*, for instance, although buried in the soil, and completely secluded from the rays of the sun, possess a strong and vivid color. We can explain neither the rule nor the exception: on the contrary, we know that, as far as lifeless matter is concerned, mineral or vegetable colors are weakened, and gradually destroyed, rather than enhanced, by the action of the light. Our ignorance in this respect restricts our influence upon the coloration of flowers and blossoms to a very modest and merely empirical one. A mere chance has led to the discovery that the infusion of sulphates of iron into the soil darkens the hue of certain plants which contain a considerable quantity of tannin; and gardeners have profited by this discovery for the culture of the *Hortensia (Hydrangea)*. But these examples are rare; and as yet we must renounce all claim to the control and influence of the natural course of things in this field. We may be able to change the color of a plant or flower by transferring it into another soil; but we are never sure of the result, and cannot give any scientific explanation of it.

"The fragrance of a flower is likewise produced by chemical action which hitherto has escaped our closest investigations; we see the result; we see that a flower, like the bee which transforms pollen into honey and wax, fabricates volatile oils out of air, water, and light; but the chemical process itself is a complete mystery to us. We only know that the slowness or rapidity of the evaporation of these oils is the cause of the stronger or weaker odor of the flower. The mode of their formation is a good example of the unlimited variability and manifold variety of vegetation's chemical powers. Many plants do not limit themselves to the formation of a certain volatile oil in their blossoms or flowers, but produce at the same time various kinds of oils in their different parts. The orange tree, for instance, produces volatile oils in the leaves, flowers, and the rind of its fruit. A close investigation convinces us that these differ, not only in their smell and taste, but also in their weight, density, and other physical and chemical qualities; that, in short, they are different and independent substances which cannot be mistaken for each other. The same plant must therefore possess three different organisms, by which it generates three entirely different substances out of the same ingredients. What chemical laboratory, be it ever so well furnished and skillfully managed, can boast of results in any respect so wonderful?"

A FOSSIL FUNGUS.—Not alone to our period do fungi belong. At a recent meeting of the Woolhope Club, Hereford, Mr. Worthington G. Smith, F. L. S., read a paper on a "fossil fungus," which he has named *Peronosporites antiquarius*, and which he explained. It was found in the scalariform axis of the stem of a *Lepidodendron* from the coal-measures, and therefore indicating a remote antiquity. Mr. Smith said that no description, except that of a Mucor, also from the coal-measures, had hitherto been published of any well-defined fungus belonging to the Paleozoic series of rocks. The specimen of the fungus now under consideration shows one of the most interesting groups of threads and fruit, or, more properly speaking, mycelia and zoospores (or oogonia) as seen with the vascular axis of the *Leidodendron*. A close examination of the mycelium shows that it is supplied with numerous joints or septa. This seems to favor the conclusion that this fossil parasite belongs to *Peronospora*. One of the most perfect groups of these Paleozoic bladders containing the once mobile spores having been enlarged to 400 diameters, revealed the remarkable circumstance that the bladder is exactly the same in size and character with average oogonia of the present day, especially with the same organisms belonging to *Peronospora infestans*, or the potato fungus. The contained zoospores are likewise similar in form and dimensions with the zoospores of *Peronospora infestans* when measured to the ten-thousandth of an inch, so that when enlarged and engraved, and placed side by side, they appear to be identical. Mr. Smith adds that in this fungus we probably have one of the simple primordial plants of the great family of fungi, and that if *Peronospora* is an Alga, we have in *Peronosporites antiquarius* a plant which, from its extreme antiquity, lends some favor to the views of Sachs and other evolutionists who place the lower Algae amongst the primeval plants for which fungi and all other cellular Cryptogams have branched.

## How are the Colors Set in Enamel.

To answer the above question, the *Jeweler and Silversmith* gained an interview with M. Piguet of New York city, who has lately introduced this art to this country. We quote a few paragraphs: "When I first began here I had to make my own enamel. You see, one must be sure he has enamel, and not some counterfeit material or other, called by that name, to deal with, or else he must surely fail. Having become satisfied that my gold or other metal is covered with the genuine article I am ready to begin. The material we use in painting are made to unite with enamel alone, and ultimately, as you will see, form part of it. If we should be deceived in our enamel we cannot succeed. Well, we find that satisfactory. These fine powders which you see here of different colors are what I use, after admixture properly upon my palette, for the paintings. These powders are actually enamels themselves, and are obtained by the colormaker from that material, and are handed to me and I pulverize and triturate them. Then I prepare them for use. Then I begin my work. I study the forms to be reproduced, and I faintly delineate them with the proper pigments upon the smooth surface of the enamels. Then having obtained this much I submit the material to the action of fire. The object of this is to burn the colors into the enamel, so that they become an integral part of the whole substance. This is a most delicate operation, requiring much experience and skill. Too much fire will ruin it, and too little heat will be insufficient to make the colors natural and ineradicable. It is actually painting by heat, for a certain degree of fire gives intensity to color or varies the shade, affecting the tone and quality of the painting. Then I resume my painting, filling in and giving shade and substance to the object. Then fire has to be called into requisition once more, and as skillfully and delicately controlled as previously; one little mistake and alas! all our labor is for naught. But we rarely make any slips nowadays. Then come the final touches; the delicate lines. Then the final action of fire and you have this fine delicate portrait on the porcelain, whose smooth surface, as you rub your hand over it, shows you that the colors are a part of the whole surface."

FATAL PARASITIC WORMS IN DOGS.—The New York *Independent* condenses from Chinese newspapers an account of a discovery why dogs in China are liable to sudden and apparently unaccountable death. This is often found to be due to the plugging of the pulmonary artery, or to mechanical interference with the action of the valves of the heart, by a mass of flariae, or worms, occupying the artery and cavities on the right side. On opening the heart the worms are found matted together in a bundle, like a coil of thick cat-gut that has been some time steeping in water. The few sluggish movements they exhibit after the death of the dog form a striking contrast to the liveliness of their minute progeny, which wriggle about in the neighborhood and in the blood throughout the system. On unraveling and extending the parent worms, they can be separated into two kinds. One sort, the larger and plumper, measure from 8 to 13 inches in length by 1-30 of an inch in diameter; the other, the smaller, five to seven inches in length by 1-40 of an inch in diameter. Their progeny are about 1-100 of an inch in length by 1-3,000 of an inch in breadth. A similar disease to this is known in America, France, Italy and other countries. Dr. Manson, in his report on these Hematozoa, is inclined to believe that the great frequency of aortic aneurism among Europeans in China might possibly be traceable to the existence of these worms in the heart and blood-vessels. With the practice he has acquired in the detection of these worms in the blood of the dog, he searched for them in man. No selection was made of cases; but the first patient or healthy person who presented himself and was willing to have his fingers pricked was examined, six slides of blood, at least, being carefully searched. In this way he of 190 cases found the worms in 15 or about 8%.

THE TORTOISE AS A BAROMETER.—M. J. P. Bouchard, says the London *Farmer*, publishes the results of a series of observations he has made for some years past on the habits of the common tortoise as indicative of approaching changes in the weather, more especially of sudden reductions of temperature. At the end of autumn, if a severe winter is at hand the tortoises bury themselves deeply in the ground so as to be completely hidden. If, on the contrary, the winter is about to be exceptionally mild, as was the case last year, they only go just sufficiently deep to cover the openings of the carapace. Taking last winter as an example, he found that they emerged from their retreats during a mild January, and their return to them late in February was shortly followed by severe frosts. One day in March, while the thermometer was standing at 50° Fahr., the tortoises suddenly retired, and the same night it fell to only two degrees above freezing point. Five times in the month of April their disappearance gave timely warning of approaching frosts, and in every instance the warning was justified by the result. M. Bouchard states that by regular attention to the movements of these sensitive weather prophets, he has been able for years past to avoid danger from unexpected night frosts in his numerous glass-houses.

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**CROWN POINT.**—Amador Ledger, Dec. 8: The superintendent informs us that the first clean-up of this mine, since the mill resumed operations, was made last Sunday. A run of 12 days with 10 stamps yielded the gratifying sum of \$1,200. Flackoning 16 tons per day, which is about the average capacity of the mill, the quartz would thus surrender an average of \$2 per ton. This result is deemed highly satisfactory. It is regarded by the stockholders as the beginning of a long era of prosperity in the history of the most promising quartz claim of Drytown.

**GOLDEN GATE.**—This quartz claim is situated at Amador City, and is the northern extension of the Eclipse property. G. W. Kiling and O. C. Fowitt are the owners. Work was started the 20th of last month. A shaft eight by six feet is down 10 feet. It is in the neighborhood of the famous Keystone, and on the main mineral belt, and these facts ought to be sufficient to stimulate its development.

**LINCOLN.**—The Lincoln mill is to be started up as soon as possible. The Superintendent, S. D. R. Stewart, tells us that both mine and mill will be running inside of a month.

**TIZ HALEY QUARTZ CLAIM.**—At Murphy's ridge, was sold at administrator's sale on Monday for \$900. I. N. DeWitt, administrator of the estate of B. Haley, was the purchaser.

**J. A. DAVIS' new quartz mill,** one mile south of the Phoenix, is all ready for crushing.

**TIZ ORIGINAL AMADOR MILL,** at Amador City, is running 15 stamps. There are 1,000 tons of rock broken, on the dump and in the mine.

**THE ONEIDA.**—Amador Dispatch, Dec. 8: A very rich and extensive body of ore has recently been struck, by crosscutting, in the Oneida mine. It cannot yet be estimated how extensive this body is, but it is by no means diminutive. The vein on which work has been going on, is also yielding very handsomely—the clean-up of last month being over \$20,000.

**AMERICAN FLAT GRAVEL CLAIM.**—Extensive operations are now under full headway to thoroughly develop the rich gravel deposits of American Flat, near Fiddletown. The claim is owned by a substantial San Francisco company, which is now constructing a large bedrock flume from some point on Purinton's water ditch to the Flat. When this flume is completed, it will probably be the means of working a number of small but rich placer and gravel claims that have heretofore been almost worthless. Times are said to be living up a little around the old nautical burg.

### CALAVERAS.

**MOSQUITO GULCH.**—Calaveras Chronicle, Dec. 8: The new pumps of the Banner have arrived and the "Col." is happy. Spaulding is pushing things and will soon have a crushing that will compare with the old record of this valuable property.

**HOLMES' MINE.**—The tunnel is in nearly 400 feet and has struck a four-foot vein which prospects fine. The mill is being put in order for active operation.

**VALENTINE.**—Work is progressing on this mine and about 10 men are employed. The company are putting up a mill, work on which is progressing finely.

**SAN BARTHOLOMEW.**—Big cave in 200 feet and no one hurt.

**HARRY HAINES' MINE** down about 35 feet and good rock is being taken out. The men are at work and three tons per day is the average. The last crushing was \$70 per ton. The rock at present looks better than ever.

**THE BONANZA KINGS, Potter & Rodgers,** have just received their returns from a valuable lot of "Blue Jay" specimens, and of course they are in good humor over it. The Blue Jay is being energetically worked and the pure stuff still holds good.

**THE CHERRY CREEK.**—Work is still progressing. This mine bids fair to out rival all others in the camp. At a meeting of the Directors, John L. Hoy was appointed Superintendent.

### INYO.

**THE REX MONTIS MINE.**—Inyo Independent, Dec. 8: The principal part of the heavy timbers and other material for the new mill for the Rex Montis is now on the ground, and we presume the work of constructing it will soon begin. The design is to make it one of the most complete 10-stamp mills in this part of the State. The old mill continues to hammer away without material interruption.

**BULLION SHIPMENT.**—Thursday's stage took out four boxes of Rex Montis bullion, weighing 236 pounds, and valued at \$2,300.

**PREPARING FOR WORK.**—We have at reliable authority that M. A. Wheeler, as agent for the Swansea company, has contracted with the Inyo Wood & Coal Company for wood and coal with which to start up the old Swansea furnaces on or about the beginning of the new year. Enough ore has been secured from different parties in Cerro Gordo, including a quantity on hand belonging to the company, to keep the furnaces running about three months, by which time it is hoped the company's mines will be able to furnish sufficient for continuous work.

**ANOTHER STRIKE IN PANAMINT.**—On Wednesday the news reached Darwin that the small force of men left to work for the Surprise Valley company, Panamint, had struck a body of very rich ore in crosscutting the main shaft in the Hemlock mine, and at a depth, as we understand the matter, of about 700 feet from the surface. This body of ore is from seven to eight feet in width, quite as rich and of the same general characteristics as the surface bodies which gave the mine a great name and value in the first instance, but which deposits all panned out in less than 300 feet from the top, as did similar ore bodies in all other mines in the district. From that point, or thereabouts, downward to 700 feet, the greatest depth attained, the rock has been perfectly barren, though the ledge never diminished in size in the least. In consequence of this fact, the company had about virtually abandoned further prospecting as hopeless. Of course the extent of the new ore body remains to be determined.

**BULLION SHIPMENTS.**—Coso Mining News, Dec. 8: The Emigrant mining company, by Peter Taylor, Superintendent, shipped per Wells, Fargo & Co., 103 pounds of fine bullion, valued at \$2,000. The total value of shipments from Wells, Fargo & Co.'s office, at this place, for the month of November, was \$13,000.

**BULLION COMPANY.**—A party in from Snow's canyon, a day or two ago, states that the mill of the Sheldon mining company was started up last Tuesday morning. We hope to be able to report, in due time, a successful run and a large shipment of gold bullion. The success of this company will have the effect to encourage others having locations near them, and we may look for the advancement this season, the high tide of development, of a section of country which has been idle for some time.

**MONOC.**—Superintendent Gupitt and Mr. Tibbetts, book-keeper, of the Monoc, were both in this week and say that everything at the works is progressing very favorably. Some 50 men are employed in the mines and the main tunnel and the daily developments are quite satisfactory. We are glad to see that operations at the Monoc are being carried on in a more careful and economical manner than characterized the management of former superintendents.

**MINNETTA.**—C. M. Blair, business manager of the Minnetta, informs us that work on their mines was resumed a short time ago and their little financial troubles are gradually being overcome.

### MONO.

**BENTON BULLION SHIPMENTS.**—Inyo Independent, Dec.

8: The following shipments, per Wells, Fargo & Co., of bullion for the year and for the last month, November, is not so very extensive, but it shows the permanency and regularity of this little camp at Benton: For the year, \$337,929.40; for November, \$92,211.

**BODIE DISTRICT.**—Virginia Enterprise, Dec. 5: The town of Bodie presents quite a lively and bustling appearance. There, also, the people are doing a good deal of prospecting and are making many new locations.

A very rich strike has just been made at the Red Cloud mine in a winze at the depth of 13 feet below the surface. The ledge is four feet in width and the foot-wall is a streak some 10 inches in width which is a conglomerate of clay, quartz and gold. Samples taken from this streak have assayed as high as \$31,801 per ton in gold and \$5,321 in silver, or a total of \$37,125. Toward the hanging wall the vein shows much bromide and chloride of silver.

The new shaft of the Red Cloud, a short distance west of this ledge, has struck a strong vein of quartz very much resembling that found in the Standard mine, and assays \$35 in gold and \$32 in silver.

Having struck water in their incline at a depth of 500 feet, the Standard company are now sinking a vertical shaft in which to place a pump, when they may thoroughly prospect their mine. They now have in sight in the Standard ore sufficient to yield over \$2,000,000, insuring them a fortune of \$1,000,000.

The Syndicate tunnel is at a distance of 800 feet, and they are now about to crosscut for their veins at a depth of 700 feet below the surface.

The Bechtel company have commenced extracting ore, which is being shipped to the Syndicate mill. Their vein is five feet (strong) in width, and mills \$100 per ton.

With gold prospects also plentiful, the Bechtel company have commenced crosscutting for their ledge, in the Savage, adjoining the Standard on the south.

Mr. Daly has bought a half interest, the consideration named being \$12,500. The owners of the other half are J. G. Haynie and H. M. Yerington.

The people of Bodie seem to have taken new heart and new life, and after a long season of semi-torpority, are waking up and going to work again in earnest.

### NEVADA.

**PENNSYLVANIA CO.**—Grass Valley Union, Dec. 8: The location of the lead of this company is near Mary's ravine, beyond Ophir hill, a section rich in gold-bearing quartz veins. The ground was divided into two lots without machinery, but the present season having been unusually dry surface water is not very troublesome, and the company have been able to sink with a windlass. They have now got down a shaft 56 feet, and at that depth have a ledge 22 inches, which shows plentifully in free gold—rock that it is estimated will go from \$70 to \$80 to the load. If the season will permit, crushings will soon be made. The ore is of the same quality as the company are sanguine that they have one of the very best leads in the district.

**PLANET GRAVEL MINE.**—The Planet Gravel M. Co., whose ground is situated near Steep Hollow, has disposed of 20,000 shares of stock, being the full amount set aside to raise a working fund. The stock has been much sought after, as the ground is believed to be very valuable. A contract for running 300 feet into the channel was let last spring, and work has been steadily prosecuted. The tunnel is now in 547 feet, and it is hoped to strike the pay channel during the month of February. The company is in ample funds, and work will be driven as fast as the nature of the ground will permit.

**CHAMPION MINE.**—The deep tunnel of the Champion M. Co., opposite the Providence mine, near Nevada City, is being driven rapidly and quietly, and new contracts have been given out as soon as the old ones are completed. The first run will be 1,000 feet on the New Year's ledge, one of the Providence series of quartz veins; then a crosscut will be made westwardly to the Champion ledge, for 1,500 feet. Total length of tunnel, 3,500 feet. This tunnel will prospect that section pretty well, and the backs will be made for the four feet of the channel. A number of rich chutes will be struck in this long run. The Providence quartz belt is one of the greatest in the country, and developments will not be wanting. The Providence ledges are of enormous size and one of them assays all the way from \$1,000 to \$15,000 per ton. The Champion mine has funds on hand for two years to come, without resorting to assessments, a circumstance which is most commendable in the mining industry.

**THE MURCHIE MINE.**—We mentioned, the other day, that the "Big Blue" ledge in the Murchie mine, at Nevada, would soon be reached on the 400-ft level, and it was anticipated that a fine vein would be opened. The vein has been reached sooner than was expected and the company has good cause for congratulation upon its splendid appearance. Yesterday the workmen had crossed the vein into the main tunnel, and the ledge was exposed. From the fact that the ledge is showing a width of from four to five feet in the 200-ft level, there is every reason to believe that it will prove as wide or wider on the 400-ft level. But the most important thing in connection with the opening of the ledge on the 400-ft level is that the ore has improved greatly in appearance and assays run high. We are informed by a gentleman, who is most competent judge with no view to any interest in the mine, that it is the finest showing that he has seen in the country and he is sanguine that the mine has now a great and prosperous future before it and destined to take rank as a leading mine.

**MATTERS UP THE RIDGE.**—San Juan Times, Dec. 8: Dr. Stolar, who went up the ridge to Bloomfield, Sunday, and from there to Blue Tent, informs us that every company between that place and North Bloomfield has closed down—even the Malakoff company—owing to the scarcity of water, and the same at Blue Tent. A water famine such as this is unparalleled at this season.

**PAYING OFF.**—Nevada Transcript, Dec. 7: Hon. Wm. Watt and A. B. Brady, Esq., visited the Watt and DeWitt mines on Wednesday last, for the purpose of making the regular monthly payments. These two companies have since their organization disbursed nearly \$100,000 for machinery and labor, and it is hoped that their efforts will not go unrewarded. The channel extending through Bloomfield township, and upon which the above mines are located, is one of the richest of all blue gravel leads in this State, and although an immense amount of labor and money have been expended upon it in the past, there is no indication of its being exhausted for many years hence. Should these two companies be successful in their efforts to strike pay dirt—and we have every reason to believe they will—other companies will immediately spring up, and before another year elapses the Bloomfield district will have assumed such an air of bustling activity on account of the hundreds of miners who will grow into the rich field, as to clearly demonstrate that California's big bonanzas are not things of the past.

### TULARE.

**WONGS MINE.**—Iron Age, Dec. 6: There are but few men now engaged in the Mineral King mines. Under the authority of the assignee in bankruptcy, of the New England tunnel and smelting company, certain parties are running a tunnel on the Black Wolf claim, owned by that company, and are working three shifts, making about 18 inches in 24 hours. It is expected to tap the lead at the lowest possible level in June next. At the Ship mine, the venture of two men running through and are well supplied for a winter's siege among interminable snow drifts. On the south fork of the Kaweah, Messrs. Ballou & Palmer have recently struck a lead of argenteiferous galena, which assays about \$105 in silver to the ton of galena.

### SIERRA.

**THE SAVAGE PLACER MINE.**—Virginia Enterprise, Dec. 7: This mine is situated in Sierra county, California, between the south and middle forks of the Yuba, and is on the main ridge through which passes the ancient river channel on which are situated the Bald Mountain and other rich blue gravel mines. The owners, with one exception, are Constockers. They began operations not long since by starting a shaft. They have sunk 60 feet through lava and have now just reached gravel. Water was found when the gravel was struck, and as they have

only an ordinary bucket and wadlows, they have been able to sink but three or four feet into the gravel, and in doing that have been obliged to take out three buckets of water to one of dirt. As the snow falls to the depth of from 20 to 25 feet the mine is no more work will be undertaken this winter. It will be necessary to set up at the shaft a small pumping and hoisting engine, and this they are afraid to undertake at this season, when a heavy fall of snow may be expected at almost any time. Next spring they will begin work in good earnest. Spire Mooney of this place has received from his brother, H. Mooney, who is superintending the sinking of the shaft, a small box of the ore that has been taken from the mine, and contains particles of gold, though they expect to sink to the depth of 220 feet before reaching bedrock. Their prospects for finding a rich mine are certainly very flattering. They have an abundance of wood and water on their ground.

## Nevada.

### WASHOE DISTRICT.

**CALIFORNIA.**—Gold Hill News, Dec. 12: Daily yield 650 tons of ore. The ore stops on the 1500, 1000 and 1050-ft levels are all yielding good ore, and show no material change during the week. The usual monthly dividend, aggregating \$1,000, was declared on the 7th. The mill is now ready to run, and the future prospects of the mine look bright and prosperous. On the 1500-ft level a drift east is being run to explore the ore body to the eastward of No. 5 ore stops, and on the 1050-ft level a drift is being run to the eastward to connect with the main north drift on the same level. On the 1050-ft level everything is in complete readiness to begin the hoisting of Cox, Virginia. Daily yield 600 tons of ore, keeping the mills running, and crushing to their full capacities. The yield of bullion for the month of November was \$1,417,103—and the usual monthly dividend of \$2 per share, aggregating \$1,080,000, was declared on the 7th. The ore stops in almost every portion of the mine are showing well and yielding good ore. On the 1200-ft level they are widening out to the south and westward. On the 1300-ft level they are in splendid condition for the rapid extraction of the ore, which is very rich. On the 1400-ft level the yield is excellent and the ore good. On the 1500-ft level preparations are nearly completed for the extraction of ore from the southern body. On the 1650-ft level everything is again in readiness to commence the extraction and hoisting of ore through the main shaft; while on the 1750-ft level the openings in the ore vein are showing finely at almost every point.

**SAVOAGE.**—The work of putting in the new lift pump at the 2000-ft station of the main incline will be finished by the last of this week. In the meantime the water is held by the pumps below the station until everything is in readiness to start up the new lift. As soon as that is accomplished, draining the flow of water from the lower levels will be resumed.

**ALTA.**—Driving the new drift to cut the ore vein on the 1150-ft level is making excellent progress. The prospecting operations on the 1050-ft level are showing more favorable as the work advances.

**ORINA.**—The new Superintendent has gone vigorously to work to enlarge the sump in the vertical shaft, and complete the water tanks and the excavation for the pump below on the 1000-ft level, recognizing the fact at once that if a strong flow of water is struck in the ore vein on the 1000-ft level, a way must be provided to handle it. The south drift on the east side of the ore vein on the 1000-ft level is steadily advancing, the face still in porphyry. During the week, whenever the drift appeared to near the ore vein, the flow of water increased so rapidly in the face that it was deemed better to change the course of the water back to the left, into a firm rock, to avoid flooding the drift and a stoppage of the work. Nothing has been done during the week in the face of the south drift from the incline on this level, and nothing probably can be done until the pumps and tank station at the main shaft are completed. On Friday last a drift east was started on the 1300-ft level to reach the newly discovered ore vein on that level.

**JUSTICE.**—The water has been let down from the face of the south drift on the 1100-ft level, and work resumed at that point. A drift north on the ore on this level has been started, the face of which is still in good ore. Three crosscuts east have also been started, one opposite the shaft and one to the northward, and the other to the southward of the shaft, all of which are being driven ahead to cut the ore vein. The shaft has reached the 1200-ft level, and is being continued downward to make a sump room. Sinking the winze below the 1000-ft level, to connect with the 1100-ft level, is going steadily ahead, the bottom still in ore.

**JULIA CO.**—Driving east crosscut No. 10 from the main south drift on the 1800-ft level is making good headway, the face still in very favorable ledge matter. The face of the crosscut No. 6, on the same level, is in a much more favorable vein formation than for some time past. There is a strong flow of very hot water from the face of this drift.

**BULLION.**—Sinking the main incline, to connect with the 1340-ft level, has been resumed and is making good headway. The rock in the bottom works well. The north drift on the 3000-ft level is steadily advancing, the face in porphyry. The ore vein is showing a very favorable ore-bearing quartz, of a much more favorable description than any of the quartz bodies found on the upper levels.

**YELLOW JACKET.**—The main drift east on the 2200-ft level continues in very hard blasting rock, being porphyry with streaks of quartz. On the same level the drift north toward the Imperial is advancing at a good rate, with its face in favorable looking porphyry and quartz, carrying a good deal of gold. No other prospecting or development work is being done on this level, owing to the great heat and lack of ventilation.

**BEST & BELCHER.**—Sinking the joint winze below the 1700-ft level is making steady progress, the rock in the bottom being somewhat harder than it has for some time past. It is the intention to start a prospecting joint crosscut on the Gould & Curry line, on the 1900-ft level, to prospect that portion of the mine in a very few days.

**GOULD & CURRY.**—The west drift on the 1800-ft level is steadily following up the drill hole recently run to tap the water in the bottom of the main incline. This water has been sufficiently drained to admit of a resumption of work in the bottom of the incline.

**SILVER HILL.**—The north drift on the 650-ft level has completed the connection with the Justice, and thereby obtained a good circulation of pure air. A crosscut east to prospect the ore vein has been started from this drift at a point 200 feet south of the Justice line.

**BELCHER.**—Sinking the air shaft incline is going ahead at a favorable rate. The winze below the 1000-ft level is being pushed ahead vigorously, following the foot-wall of the ore vein, and is showing a favorable character as greater depth is attained.

**MEXICAN.**—Sinking the joint Ophir winze below the 1700-ft level is being pushed steadily ahead to reach the 1000-ft level of the Ophir, at which point preparations are being made to connect the north drift with the bottom of the winze and thereby ventilate the lower levels of both the Ophir and Mexican mines. The north drift on the 1800-ft level is making good progress, the face still in very favorable vein matter.

**CON. INFERNAL.**—Sinking the joint winze on the Alpha line on the 2135-ft level is making good progress, the ore indications showing better as the sinking progresses. The south winze on the same level has reached the 2200-ft level of the Yellow Jacket, at which point a drift is being started to connect with the Justice line.

**SIERRA NEVADA.**—The prospecting operations on the 1700-ft level are being pushed ahead in every direction with encouraging appearances.

**HALE & NORCROSS.**—Owing to the necessity of putting

in a new lift pump below the 2000-ft station in the Savage and the clearing out of the water tanks 50 feet below the 2000-ft station in the Ifale and Norcross, no gain has been made upon the flow of water.

**UTAH.**—The north drift on the 1300-ft level is steadily advancing, the face in very favorable ground. The north drift on the 1150-ft level is in 445 feet, the face in porphyry.

**LADY WASHINGTON.**—The main drift east on the 850-ft level continues steadily advancing toward the ore vein. The face is in very favorable ledge matter and the increase of hot water seepage shows the ore vein to be not far off. The drift south on this level to connect with the 1000-ft level of the Justice is running in low-grade ore, giving assays of from \$15 to \$20 per ton.

**OTERMAN.**—The south drift on the 1400-ft level is making the best of progress, the face in very favorable quartz and ore. Sinking the winze below this level to prospect the ore vein in a downward direction is making good progress.

**CON. VIRGINIA.**—Sinking the main shaft below the 1300-ft level is being pushed forward with all possible vigor, the bottom in good blasting ground, and the flow of water giving no trouble whatever.

**CALCEDONIA.**—The air connection with the Overman on the 1400-ft level has been completed and much better ventilation obtained to that depth. The north drift and prospecting crosscuts on the 1000-ft level continue to show good prospects of ore.

**WARD.**—Sinking the shaft is making excellent progress, the shaft only lacking a few feet of having reached a depth of 1,000 feet. The rock in the bottom blasts well, and the flow of water gives no trouble.

**CROWN POINT.**—Daily yield, 50 tons of ore, keeping the Rhode Island mill steadily running. The east prospecting drift on the 2000-ft level is rapidly advancing, the face still in quartz, low grade ore and porphyry mixed.

**TRIOX.**—The ore yield is about 50 tons per day, and the Vivian mill is kept steadily running. The breasts and stops of the 350 and 240-ft levels are showing finely, and at the 350 the ore body is fully 40 feet wide, with evident extension to much greater depth.

**STURIO TUNNEL.**—Making very good advancement at present, though favorable working ground, consisting of ledge porphyry, with seams of quartz and clay. Total length of tunnel, 18,478 feet.

**LEVATHAN.**—Sinking the incline below the 600-ft level is making excellent progress, following the under side of the ledge, in the foot wall.

**NEW YORK.**—Sinking the shaft deeper is now in full progress.

**SOUTH COMSTOCK.**—The south drift on the 500-ft level is in 145 feet to-day. The face has changed to more of a clay formation, with increase of water seepage.

**BALTIMORE & AMERICAN FLAT.**—Driving the north drift on the 1400-ft level is making good progress, the face in quartz and vein matter of a fine character.

**WHITE LEAD.**—Face of main drift in ledge material, which works easy, allowing of good advancement.

**NORTH DAVENPORT.**—Plenty of low grade ore is developed by the drift, with occasional small streaks of good pay ore.

### BRISTOL DISTRICT.

**GREAT EASTERN.**—Pioche Record, Dec. 8: Three six-mule teams, loaded with supplies and hoisting works for the Great Eastern mine, left here Thursday morning. We understand this mine promises well, having quite a large body of ore already developed that will average \$80 per ton. As soon as the hoisting works are in place it is the intention of the Superintendent to commence shipping ore to Bullionville for reduction.

### EUREKA DISTRICT.

**METAMORPHS FURNACE.**—Eureka Sentinel, Nov. 8: Everything is moving along very smoothly at the Metamorphs works. The furnace is working like a charm, and the machinery runs without hitch or delay. The sample mill on the second floor is a model in its way and a wonderful help to the chemist. According to the sinking of the considerable outside ore is being reduced, and large quantities are arriving daily. On Wednesday last the furnaces turned out 167 bars, or a trifle over eight tons.

### ESMERALDA DISTRICT.

**PROMPT.**—Virginia Enterprise, Dec. 5: Geo. Daly, who arrived here yesterday from Aurora, gives a good account of the prospects of that place and Bodie. Mr. Daly is superintending the erection of works that are about to be put up for the purpose of thoroughly prospecting the old Real del Monte mine. He has graded a road some 2,000 feet in length from the town of Aurora to the point where operations are to be commenced; also, has graded a site for a shaft and shaft-house. The sinking of the shaft will be commenced to-morrow. A hoisting engine will arrive on the ground next Monday. All the necessary lumber and timbers will be sent out from Carson. About 30,000 feet of lumber will be required. The freight on this will be two and one-fourth cents per pound, and as it weighs about three pounds per foot the transportation alone will cost \$3,400.

The resumption of work on the Real del Monte mine has aroused the old settlers, and they are scouting out and prospecting in all directions among the hills.

On Thanksgiving Day a rich discovery was made by Zinc Barnes and others on Middle hill. The ledge found by them is six feet wide and assays from \$40 to \$300 on the croppings. In the early days a few rich little pockets of ore had been gouged out along the course of the vein, when it was abandoned.

### ELY DISTRICT.

**RAYMOND & ELY.**—Pioche Record, Dec. 8: Are going down incline on the winze from 1200-ft level, having reached a depth of 30 feet. The usual amount of low grade ore is being extracted from the upper levels; no change in other portions of the mine. Fifteen stamps of the mill have started crushing ore; expect to keep them going steadily.

**DAY MINE.**—All the works around this mine are being pushed to completion. Have been extracting ore and the work of hauling to the mills in Bullionville for reduction will commence on Monday next; teams will be kept going constantly between the mine and the mills hauling ore. The upper tunnel and incline are pretty near meeting.

**PIOCHE BULLION.**—\$14,543.88 in bullion was shipped by Wells, Fargo & Co. during the week.

### WHITE PINE DISTRICT.

**THE EBERHART MINE.**—White Pine News, Dec. 8: We are informed that quite a chamber of high grade ore is being opened out in the Eberhardt mine. This is an extension of the old one which was worked out last year. The present discovery has been followed by narrow streaks leading from the old chamber, and now the indications seem favorable for another large ore body in that direction. If such should prove to be the case, the company's mill could be run all next summer, regardless of the developments in the tunnel, and the mine be again placed on the list of the dividend paying. We believe that the Eberhardt & Aurora company has yet a future before it that will surpass in merit even the highest hopes of its most sanguine stockholders.

**THE HUNTER FURNACE RUN.**—Mr. Ellsworth Daggett, Superintendent of the Hunter Con. Co., was in town last Thursday. The furnace has closed down for the winter, after a successful run, which realized for the company \$71,000. The company's mines will continue to be worked all winter.

## Arizona.

**TURKEY CREEK.**—Arizona Enterprise, Dec. 1: Pat Hamilton is in Turkey creek. He reports good mining and milling prospects on the creek. Says that Master-son's mill blew its whistle a day or two ago and will start in crushing ore Tuesday or Wednesday next. W. Z. Kelly will run the mill. Dave Nagle has charge of the mine.

**ARIZONA.**—Through the politeness of the gentlemanly Superintendent, Mr. Gillet, I was enabled to make an examination of the Tip-top mine, and notwithstanding all the reports of the immense richness of its ores, was

(Continued on page 380.)

## Trees and Rainfall.

No. 4.

[Written for the Press by SAMUEL PURNELL.]

## Conditions in California.

The same monsoon that blows across the hot sands of Arizona, sweeps also over the Colorado and Mohave deserts, but for the same reasons that it could deposit no rain in Arizona it can deposit none in southern California. Moisture cannot be condensed from a wind that is cooler than the earth. The only summer rains that fall upon western Arizona or southern California are those locally denominated "cloud bursts," in which the rain, instead of falling gently, comes from the cloud as one sheet of water, and gives rise to mountain torrents that carry everything before them and add additional desolation to the country. "Cloud bursts" have their origin in electrical discharges, as the electrical discharge takes place instantly, so does the water fall from the clouds where it had been held in repulsion while somewhat cooled by the presence of high mountains. Accordingly we find "cloud bursts" are discharged upon mountains that overlook hot and sandy valleys. The reflected heat of the latter drives the clouds to the extreme point of the mountain, and, amid great electrical disturbance, sheets of water descend so suddenly and with such force that portions of the clouds are carried along. This water is from the South Atlantic, and the winds that brought it, being now almost completely deprived of moisture, are deflected by the Mohave mountains, and are not felt upon the coast or in the valleys of California and Oregon. The Pacific coast, receiving no summer rains from the great Atlantic current that waters all the country to the east, has only the winds of the Pacific ocean from which to hope for summer rains. That no summer rains fall in California, but that they fall in abundance in Oregon and farther north, is well known; it is not so well known why.

## The Wind

That blows upon the Pacific coast from May to October is called a "trade wind." A northern equatorial current of water strikes the coast of Asia near the Island of Formosa, is deflected north and northeast, forming the Japan current, or the Black stream. This gives off the Kamchatka current running up toward Behring's strait; but the main body crosses over toward Alaska, then runs south as the Pacific coast current, and off the coast of Mexico, into the equatorial circulation.

Accompanying this vast body of moving water is a strong wind, the north Pacific trade wind, which in Oregon blows from the north and in California from the north west. Blowing over a sea cooled by an Arctic current, saturated with moisture at as low a temperature as 55° F., its relative humidity is very low, containing but about four grains of water to the cubic foot of air, or only about one-third that possessed by the warm monsoon when it strikes the valley of the lower Mississippi. At this low temperature it strikes the coast of California, which is generally bare of trees, in many places sandy and heated up from 70° to 90°. The consequence is that as soon as the moist, cool wind strikes the heated land its temperature is elevated, its relative humidity is lowered, it relatively contains but half as much moisture, it can now absorb more water, and instead of being in a condition to impart moisture it will dry everything that it passes over. The summer trade wind can only be caused to deposit a portion of its moisture upon California by cooling it below its dew point, when it would probably deposit half its vapor before it reached the Sierras.

There is but one way to accomplish this, and that is by the planting and maintenance of forests upon the coast range of mountains, and covering all the valleys not absolutely needed for the sustenance of the people, with living grass and trees. As long as the present nakedness of the valleys and mountains of the coast continues there can be no hope for summer rains, and the interior of the State must, for the greater part of the year remain a barren and burning region.

## In Oregon

Summer rains frequently and regularly fall and are precipitated from the same trade wind that strikes the California coast, but Oregon offers conditions whereby the wind is cooled and its water falls. Western Oregon is densely wooded and to that fact is due the annual fall of 60 inches of rain or three times as much as the average of California. Western Oregon, in consequence of this rainfall, equally distributed throughout the year, has a far superior climate to, and is far more productive than any portion of California, and her great Willamette valley is a paradise when compared with hot and arid wastes of the interior of this State.

In Eastern Oregon the lofty Cascade mountains squeeze from the trade winds the balance of its precipitable moisture, and east of them Oregon has few or no forests, only a few inches of rain annually, and is in the generally barren condition of Nevada. North of Oregon the forests are still denser, the earth is still cooler and still more rain is thrown down. The rainfall, as to amount and time, upon the western coast of Mexico is substantially like that of southern California.

## Sun Spots and Rain.

As all terrestrial motion depends upon and is transmitted from the sun, it follows that more

or less activity of the sun will cause more or less activity in the motive powers at work upon the earth. After many years of observation in many parts of the globe, it has been determined that the activity and dynamic quality of the sun varies from year to year and in a cycle of about 11 years, and that this varied activity is coincident with an increase and diminution of sun spots. When the surface of the sun is thickly covered with spots, its potency is enormously magnified, and the solar forces which govern all terrestrial phenomena are correspondingly exalted. At such times great storms and cyclones sweep over the earth, free electricity is abundant, and the quantity of water evaporated from tropical seas by the electro-dynamic action of the sun is so large that the whole earth is well watered by copious rains. On the other hand, during the period of minimum sun spots, the dynamism of the solar envelope is greatly lessened and its influence upon the earth is correspondingly decreased. At such periods, the atmosphere is generally calm, ships sail through tranquil seas, hot weather prevails, and there is too little electricity in circulation to mechanically produce the great tropical evaporation necessary to water the earth; drowths then prevail.

This has been found to be invariably the case in India—a country most admirably fitted for meteorological exploration—where it has been definitely ascertained that years of drowth and famine correspond with those of minimum sun spots, and vice versa. Consequently, it has been possible to predict, approximately, the annual rainfall of India and its resulting plenteousness or famine. The same has been found to be true of the Cape of Good Hope, and of other places where systematic observations have been made, and it will be found true of all parts of the earth when science has encompassed it.

The whole scope of the power and influence of sun spots, or of that solar condition of which they are indicative—the learning of which, in fact, constitutes the new meteorology, and embraces all of the science that has any prophetic

this winter, yet in consideration of the paucity of sun spots and the absence of electro-dynamism the author, in accordance with the latest deductions of science, ventures to predict that the rainfall this winter will not vary much in quantity from that of the winter of 1876, when the rainfall at San Francisco was less than 10 inches, and that, consequently, another dry season upon the Pacific coast may be confidently anticipated.

## The Winter Rains

Of the Pacific coast need but little attention in this connection. They usually fall in ample volume, and equal in amount those of most fertile countries. The rain winds of winter come from the southwest; a warm ocean wind, saturated with moisture at a high temperature, and carrying three times more water than the summer winds. Being winter in the northern hemisphere the land is much cooler than in summer, much cooler than the southwest wind, and as that wind sweeps over the mountains it is cooled below its dew point and part of its moisture falls as rain. This is the case annually, and all parts of the State receive the baptism of water, whether naked or wooded. The amount of forest, however, has a great influence upon the amount of local rainfall; the Colorado desert and western Arizona receiving but about three inches; the vicinity of San Diego, 10 inches; San Francisco, 21 inches; Humboldt bay, 34 inches; while the forested Sierras receive the copious drenching of from four to six feet of water.

It is not the want of winter rains, but the absolute dearth of summer rains that renders so large a part of the Pacific coast barren and inhospitable, and which, if not remedied by the wisdom and labor of man, will for many centuries in advance maintain a hot and arid waste over a portion of the earth that is capable of being converted by summer showers into a paradisaean region of plenty and delight.

## The human

## History of California

Reaches back but three centuries, and its testi-

A HANDY FAMILY TOOL CHEST.

value or stable foundation—is not yet entirely understood, as the determination of their effect is quite recent, and profound investigations are still in progress; but enough is already known to affirm in the strongest manner that the number and volume of sun spots is an indication and prophecy of mild or intense solar disturbance and potency, to every variation of which the earth immediately responds, and as the volume of the sun spots increases toward the middle of the cycle so do the terrestrial forces increase and ultimate in tempests, electric storms, and especially in that great equatorial evaporation that brings copious rains upon the earth at large.

While the total amount of moisture falling upon the earth during a season is gauged quite accurately by the sun spots, yet the rainfall of any particular country during any particular year is modified by continental and cosmical influences at present but imperfectly understood, as sometimes under a minimum of sun spots a country receives more rainfall than upon the average, and vice versa, the rain not being distributed strictly as the aspect of the sun would appear to indicate; still the rule is surely ascertained, and the general quantity of rainfall can be now confidently predicted far in advance of its coming, and to a certain extent the probable local rainfall of any particular country.

By reference to a chart it will be seen that the dearth of the winter rainfall of California since 1849 appears to have been dominated by the 11-year periods, and by the solar potency immediately preceding and succeeding the cycle years. Although locally it has received heavy rainfalls in certain years that do not appear to correspond with the solar disturbance, the reasons for which can at present be only surmised, yet it appears certain that the amount of rainfall has generally been relative to the number and magnitude of the sun spots. The year 1876 was the close of a cycle, and was one of a minimum of sun spots. Drowths occurred in India, Southern Africa, Australia, the Pacific coast of America, and especially in California. The solar aspect during the present fall, that of 1877, is much like that of 1876, the sun now being but slightly more spotted than then, and averaging but about one-tenth the maximum sun spot area. While influences and modifiers, of which we are at present in almost complete ignorance, may materially vary up or down the totality of the rainfall upon this coast during

remedy the evil. Small groves of trees are disappearing, the water in the wells must be sought deeper, the artesian wells flow less, the winters have less rain, but little snow falls upon the mountains or long remains, great river beds are seen through which small brooks do not now run, and the climate in summer upon the deserts possesses an average temperature of 100° to 114°, equal to that of the great Sahara, and much hotter than that of India, Persia and the Red Sea. The evaporation of southern and central California in summer equals one-quarter of an inch in 24 hours. The annual evaporation would amount to 95 inches, or equal to that of the Dead Sea. Were the entire flow of the Colorado river turned into the desert, it would all be evaporated from a lake of 556 square miles of surface. At a few hundred feet from an interior river, its influence in raising the average humidity is not perceptible, so quickly is the vapor diffused into the surrounding air.

## Amateur Carpentry.

There are very few men, either young or old, who cannot do a very useful and very satisfactory little job of home carpentry if they have a few tools fitted for it. There are a hundred little things a month which may be either made or repaired, and thus made to minister to convenience and comfort. They are often too small to call in the practical mechanic, and unless the amateur can encompass the need there is often a loss of both money and enjoyment. More than this there is an ever present advantage to the young man who early learns the use of a few simple tools, and there is a never ending gratification in the well-doing of a job to one who has once tasted the satisfaction of the mechanic's achievements. The economy of home carpentry; the instruction of the young in the use of tools, and the gratification of all who have tastes for mechanism, are all made more attainable by the very compact and yet comprehensive sets of small tools which are contrived by our tool makers. We had one of these sets of an early pattern 20 years ago, and, though since that time, we have gone through an apprenticeship at the hench and the lathe, we still find a set of the modern improved amateur tools of constant service to us in our little home mechanics.

These remarks, drawn from our own experience, are called out by the engraving on this page representing a little "Family Tool Chest," which we have used to good advantage. It is one of many styles of low-priced tool chests sold by Dunham, Carrigan & Co., of Front street, S. F. One of them would be a far better Christmas present for a boy or young man than all the useless things which are brought forward at holiday time. Nor are they exclusively for young men. We have a good lady at our house who can use the contents of the little chest as handily as she does her sewing machine when a little woodwork in the house or in the garden, needs immediate attention. We have no doubt that many of our readers will find styles of these useful chests to please them in the interesting circular issued by the firm we have named above.

**MINING SUIT.**—The Keystone mining company has entered suit in the First Judicial District Court of Nevada, praying that the tax title under which the Lady Washington mining company lays claim to the Keystone ground, be declared invalid. The complaint sets forth that the plaintiff is incorporated under the laws of the State of California; that the defendant is also incorporated under the same laws; that since March 2d, 1874, plaintiff has been the owner of and in peaceable possession of the mining ground (which is 1,200 feet in length), known as the Keystone company's claim; that subsequent to the acquisition of said ground by said plaintiff, the defendants claim to have acquired a right and title to the premises of plaintiff by purchase at a tax sale by the Town Marshal of Gold Hill; and that defendants claim solely under a deed executed by said Town Marshal of Gold Hill. Wherefore plaintiff prays that judgment be entered in favor of plaintiff, declaring and establishing its title and estate to the premises above described to be valid and absolute, and that the title claimed by the defendants be declared invalid.

**OLD RAILS AS BRIDGE MATERIAL.**—We read in the Railroad Gazette that a new use for old rails is suggested by two Austrian engineers, who have published a book containing designs of bridges and other framework constructed almost wholly from old rails, the connections being sometimes made by means of other rolled iron shapes and sometimes by bolts and rivets. At present prices, it is said that the structures of old rails are 27 to 30 per cent. cheaper than equivalent structures of ordinary forms. Holes in rails used for such purposes must be drilled and not punched, and this increases the expense somewhat, but it is claimed that the rails are worth much more for such purposes than for re-rolling, and that they are very good shapes for use in structures, when properly used. It does not appear from what we see said of the book whether the authors have actually made any bridges of old rails.

THE attempt to introduce dummy engines of the kind used in Philadelphia upon the Cincinnati street railroads has been abandoned.

## Home Industries.

## The Manufacture of Kid Gloves.

We always welcome with pleasure any new enterprise brought into this great and wide-spread land, especially when it makes its first appearance in a part of the country where we are most interested. Of late years, for the sake of deriving larger profits and to obtain new and undeveloped fields of operation, foreign manufacturers have found it to their interest, either by establishing agencies of their respective products, to supply the demand of this great nation for all kinds of articles of comfort and luxury in a direct and unrestricted way, or by becoming members of our society themselves and moving over into our country with all the necessary outfit, assistance, machinery, etc., to commence right in our midst to produce and manufacture such goods as they had been accustomed to bring upon the market, perhaps, for many years previous; in the manufacture of which article they had acquired especial ability, proficiency and reputation, thus reaping at once a greater return for their experience, skill and industry, and thus on the other hand supplying the demand among us more directly, more economically and otherwise more advantageously. It would be difficult and out of place here to enumerate the many industries that gradually find introduction among us. May we only hope they will still increase and continue to come to us, to their introducers and to our own advantage.

To many the manufacture of the kid glove, the subject of our present consideration, would seem to be in a great sense unimportant, useless and a waste of time; for, especially in this part of the country, how many are there who never have any occasion whatever to use such an article. They would no more buy a kid glove than they would be apt to fly, no more think of using such a thing than others again would think of going without it. Thus it is curious to observe the difference of opinion on this one article of luxury, unimportant in the view of so many and yet of such vast and indispensable importance in the eyes of yet a greater class who favor it, buy it and use it.

For the interest of both classes concerned, those whose daily avocation makes it needless to use a glove—except upon some rare and exceptional occasion—and those who are so placed as to have a more frequent or a continued occasion for its wear, we desire to call the attention to a new manufacture of kid gloves that has only just sprung up among us; the one of Salmon Israel, Esq., from Paris, at 119 Sutter street, between Kearny and Montgomery. This industry, novel and interesting alike, promises to be well received, and to bring to its proprietor and to the community at large the various advantages and points of interest previously referred to. The establishment is headed by Mr. Israel in person, and though his time seems to be well occupied, he was so courteous as to give the following various points of interest:

There are a few leading manufacturers of gloves in France, with whose names the American market has become sufficiently familiar, as they represent the Jouvins, Preville, Alexandre, Drefousse and other establishments. These names originally were a guarantee for a good quality throughout, but of late many spurious articles and imitations have been palmed off with similar stamps and names. The glove at present of greatest estimate in the French capital bears the name of the "Lavallier" glove, not the name of the manufacturer, but called so after an actress, who was the first to introduce this special patent and original style of kid glove. It is claimed to possess various apparent advantages over anything else ever produced in this line, and principally on account of being manufactured of only the very best and therefore most durable material.

Having full experience as to the value of these points, and observing this opportunity of introducing such a genuine article to advantage in this wide community, Mr. Israel undertook at once to remove into our midst and to supply the public demand direct and with accustomed care, with what he has been producing to so great an advantage at home. To make success a certainty he brought with him the whole outfit entire; the stock, in finest quality and greatest variety; interesting machines for cutting this pattern in less than a minute, which, together with their pressing apparatus, represents many thousands of dollars of capital; furthermore a number of peculiar kind of sewing machines differing materially from those commonly in use, to sew the side and only seam of the glove in a most delicate and accurate way. These machines are also estimated to be of great value, as they are with the other, the only one in this country. There are a great number of French Demoiselles busily engaged in the cutting, sewing and finishing of the many gloves that are ordered continually. These assistants all having been brought over from France to complete the successful working of the enterprises. Thus the house is prepared to do a great amount of work and can easily turn out hundreds of pairs of gloves in a day, completing any individual order in two hours time only. Other advantages are that gloves can be made to order to match any special color of dress, with two, three, four, up to twenty-five buttons, according to order, and as the hand is measured, the fit ultimately is very perfect and ex-

act. We would especially call attention to this fact that those who may have, by nature or accident, any peculiar shape or form of hand can have gloves fitted as smoothly as in other cases, thus making them more ornamental and at the same time more easy and agreeable to be put on.

This new industry will be alike pleasing and interesting to all who may have occasion to inspect it, and, after close examination, to patronize it, when occasion permits; for the fact of being able to see all things clearly with your own eyes, and have the whole process of manufacturing explained in all its detail on the spot is sufficient to inspire one with confidence in the product.

## USEFUL INFORMATION.

## How Oil Cloth is Made.

The *Polytechnic Review* has been looking into the manufacture of oil cloth, and from the results of its investigations we take a general description of the process, which we believe will be interesting to all readers: The oil cloth, so called, as used for floor covering, consists of strong jute cloth, ("burlap") covered with mineral colors ground in oil. The burlaps weigh from 9 ounces to 12 ounces per square yard. Their open texture must be filled up, and a smooth, heavy ground color put on before the reception of the pattern. For best quality goods, from six to eight coats of ochre and whiting, ground in linseed oil, are applied. The cloth for third quality goods is "starched" with a glue size as a priming coat, receiving afterward several coats of oil color. The "painting machine" is primitive in construction, but rapid and effectual in operation; it is used for either starching or grounding with oil. The 50-yard roll is attached by hooks to the base of a wooden triangle, and a rope attached to the apex of the triangle drags the roll through the painter and along a drying rack. The paint is applied with a dipper, and is spread by the cloth passing between an oil cloth cushion and a steel knife edge, slanting in the direction of motion. Fifty lineal yards a minute can be printed; in all from 8,000 to 10,000 yards in the various grades are daily printed in the whole establishment. After each of the first four coats of oil color, the goods must be "shaved," as the fibers of burlap make the surface somewhat fuzzy and uneven. The "shaving" machine has a table over which the cloth is passed, lightly stretched, while two bars, each bearing two pumice stone "bricks" (or more according to width), scrub the surface with a longitudinal and traversing motion, imitating hand-scrubbing. The pumice stone rubbing gives a fine, even surface; and after the last ground coat, the pattern or color blocks may be applied. The blocks employed in printing are similar to those used in wall-paper printing, being maple blocks, one cut for each color. These blocks are either in peg-work, line-work or rule work. The first are made by sawing the blocks lengthwise and crosswise with a circular saw (leaving square "pegs" projecting), and then cutting away those portions not intended to print. The line work has its design in parallel lines only. The brass or copper blocks have the design traced in the flat block, and then sharp brass rules driven into the required outlines. Peg-work is repaired by driving in copper wire cut square at one end and sharp at the other. Line-work is repaired by brass rules driven in. The felt filling used between the rules of some wall-paper blocks is not here employed, as preventing proper impression. For mat-work the block embraces one-fourth of the pattern, and must be of such a character as to admit being turned to print successive corner quarters. After all the single color impressions have been given, one block, called the "masher," which has no color applied to it, and which has on it the whole pattern, is applied, and given a strong impression. After printing, drying is in order, and should last at least 10 days. The older oil cloth is, the better, as the paint hardens. "Dryers" injuriously affect the linseed oil; air drying is preferable, but the American market cannot afford it. In England, a piece of oil cloth is frequently six months in making; here it is generally but 30 days. The heat is graduated to 130° F., running up from 90°. The principal pigments employed are vermilion, drop black, Venetian red, Sienna, chrome yellow, whits lead and umbers. After printing and drying, varnishing is in order, copal varnish being sprinkled on the roll and distributed by two vibrating arms, each bearing five soft bristles. The roll is handled by means of the triangle and drag rope, and hauled through and into the drying racks.

## Tests of Quality in Watchmakers' Oils.

A long article on watchmakers' oils is given in the German *Watchmakers' Journal*. It shows that evil effects follow the oxidation of the oil (or rancidity) and gives tests to detect this state. We quote a few points: The organs of taste and smell are insufficient to ascertain what degree of inclination an oil has to become rancid, or even to indicate at once when it has actually become so. The following method will answer this purpose: Pour the oil in a bottle, together with an equal quantity of water, in which soda (carbonic sodium) has been dissolved; then shake it violently and let the mixture stand for some hours. If the two liquids separate perfectly, particularly under a higher temperature, it is a proof that the oil is free from

acid. On the contrary if a white substance shows itself between the two, it is certain that acid is present. Another method is based on the great sensibility of litmus paper in regard to acids. Litmus paper can be bought at the chemist's. Acids which have become free in an oil, will change blue litmus paper into violet or even red, according to the strength of it.

Many think that the clearer an oil the better it is. This is a decided mistake. A bad color certainly indicates impurities, but if colorless or yellow it is in this respect immaterial. In fact, those very clear oils are generally the most apt to become rancid, because the methods employed for the clearing process tend mostly to forward oxidation. To test the fluidity of oils by letting different sorts run off an inclined plane is also a doubtful experiment. Not only are there oils so poor in body that they flow too freely, and do not give the required protection against friction, like the sesame oil, but many other obstacles—scarcely observable with the naked eye—such as a slight unevenness in the surface of the plane may influence this trial. A far more reliable way of ascertaining the desired degree of fluidity is to saturate a strip of blotting paper with the oil, and watch whether the drops will fall off in pearls, or show an inclination to spread out. The latter is a certain sign of a viscid oil.

**CURLING OSTRICH PLUMES.**—A correspondent of the *Inter-Ocean* says: If possible, an old plume should be used to practice on until one gets her "hand in," as two or three broken feathers in a nice plume might spoil it. With the left thumb and forefinger hold that part of the quill to which the feathers being curled are attached, and with a rather dull but pointed penknife take up the slender feathers, one at a time, beginning at the base of the plume and working toward the point. This pointed blade will enable one to pick up the feathers readily; then, with a quick movement, acquired only by practice, the blade and thumb between which the feathers are held are to be drawn to and off the end of the feather, when it will curl back toward the quill, more or less according to how tightly it was held while being drawn between the thumb and knife. If it is only desired to curl the tip end, as in long plumes, it is best to hold part of the way down the vane, instead of holding the quill. Patient practice will enable one to curl plumes nicely within a reasonable time and their added beauty will repay the trouble.

**BUTTER PACKING FOR TRANSPORTATION.**—At the commencement of the present century, Appert devised his well-known method of "hotting" butter. It answered admirably, but for some reason or other has completely fallen into disuse. Then M. Beon adopted the plan of covering butter packed in tins with a thin layer of water acidulated with tartaric acid, or with a solution of six grammes of tartaric acid and the same quantity of bicarbonate of soda in a liter of water, and soldering up the cases. This process, too, gave excellent results, and is still practiced by some large houses in Italy and by the Grand Compagnie de Copenhague.

## GOOD HEALTH.

## Danger in Damp Houses.

A writer in the English journal, *Public Health*, has the following points which should be borne in mind by all home makers: It is a common notion that the country is more healthy than the town, and we readily grant that, in the elements of pure air and quiet, the country has advantages; but it is not true to affirm that the country is *always* the healthiest. As Dr. Bartlett says, if old residents rebuild his house, he does so on the old site, for the sake of association or more urgent motives. The site may be marshy, always saturated, or badly drained; yet it is considered preferable by the old occupant. Again, the city merchant who retires into the country selects a secluded spot, surrounded by trees; it may be badly drained but being in the country, it is considered above suspicion—on sanitary grounds, at all events. If a homestead is contemplated, the farm buildings will be placed close to the house, and the farm-yard so near the window that the effluvia of the manure is constantly the evil to be borne, if not grumbled at. All that affects the substratum, the drainage of the soil and the position of the house, is too generally disregarded, in the idea of enjoying country air. The proximity of a farm house is even, by some people, imagined to be conducive to health, so singularly ignorant of sanitary laws are they. Most country cottages have pig-sties, and the floors of these are a prolific source of nuisance; but occupants are under the impression that the unpleasant and pungent smell that is engendered is not harmful. In fact, it is strange to find that a country air strongly and constantly diluted with noxious gases is believed by many to be healthier than a town air free from these nuisances. But land-drainage is, perhaps, even more a source of unsanitariness in country districts. In 1852 a sanitary report was published, in which certain propositions were laid down, showing that "excess of moisture, even on lands not evidently wet, is a cause of fogs and damps;" that "dampness serves as the medium of conveyance for any decomposing matter that may be evolved, and adds to the injurious effect of such matter in the air; in other words, the ex-

cess of moisture may be said to increase or aggravate success of impurities in the atmosphere;" that "the evaporation of the surplus moisture lowers temperature, produces chills, and creates or aggravates the sudden, injurious changes of temperature by which health is injured." Now these propositions have reference to conditions that exist more largely in rural than town districts. Malarial disease, tuberculous consumption, typhoid fever, and various other functional diseases, are well known to spring from a high level of ground-saturation. Wherever this condition of ground moisture has been reduced by artificial means, these types of disease have been found to diminish in their intensity; and it is chiefly by the mists generated by this constant dampness that we must account for the aggravation of the symptoms in those maladies. It is a fact that the most fertile soils are those which give rise to zymotic diseases, while those of sand, chalk or gravel, and of a porous quality, are the healthiest.

## NEW THERAPEUTIC USE OF EUCALYPTUS.

The growth of eucalyptus in this State has become so general that we feel sure that all news of use and virtue in the tree will be read with interest. In his "Clinical Studies," Sir John Rose Cornack makes some remarks upon a therapeutical agent, the eucalyptus globulus. In simple uterine catarrh, Sir John Rose Cornack says that he does not know of any remedy equal in value to preparations of this plant. "In such cases," he continues. "I have several times, with most satisfactory results, simultaneously administered them by the stomach and in the form of injections. As Guhrer has shown, the anti-catarrhal virtues of eucalyptus are most remarkable. With increasing experience of its power, I more and more employ in bronchial, vesical and uterine catarrh, in gonorrhoea and in gleet." An infusion (one-half oz. to two pints), or a tincture (one oz. to one pint of rectified spirits) of the leaves, or the essential oil given in capsules, are the preparations ordinarily employed. As a gargle or vaginal injection, and for external application, the infusion or the tincture diluted (one drachm to six or eight ounces of cold or tepid water) may be used. Besides these therapeutic uses of the eucalyptus, the author adds his very favorable experience of its remarkable power of destroying the fetid odor of morbid discharges without the substitution of another unpleasant smell. He speaks from an extensive trial of eucalyptus lotions in horrible offensive discharges in cases of ozena, cancer of the tongue and throat, cancer of the uterus, gangrene, and other affections attended by fetor.

## RESTORING THE DROWNING.—The New York

*Tribune* describes an instrument devised by M. Woillez for resuscitating asphyxiated persons, and particularly those who have been in danger of death by drowning, is claimed to be superior to all other methods or appliances employed for such purposes. It consists of a sheet iron cylinder, large enough to receive the body of an adult person. This cylinder is enclosed at one end and the body of the patient inserted, feet foremost, at the open end, up to the neck, around which a diaphragm is placed in such a manner as to prevent air from entering the cylinder. An air pump is then set to work; the air is drawn off from the cylinders with the result of causing a partial vacuum, when the outer air, by its weight, forces itself into the lungs through the mouth and nostrils, which are exposed to the external air; by an opposite action of the pump the air is allowed to re-enter the cylinder, and respiration is thereby initiated. A glass plate inserted in the cylinder enables the operator to watch the movements of the chest, which rises and falls as in life, with the alternate working of the pump; these may be repeated about 18 times a minute, an exact imitation of natural breathing is thereby effected.

CARBOLATED CAMPHOR.—In the *Bulletin de*

*Therapeutique*, M. Soulez describes the new preparation known as carbolated camphor, now becoming quite popular in European medical practice on account of its tendency to produce diminution of re-action after severe operations, cessation or amelioration of pain and less abundant suppuration. It is made by dissolving 2.5 grams of powdered camphor in one gram of carbolic acid, a solution of the strength of nine grains in one grain of alcohol—the solution being of an oleaginous, pale yellow, smelling slightly of camphor, but having none of the disagreeable odor of carbolic acid. It boils at a slightly elevated temperature, without decomposing, and also by the addition of concentrated alcohol, which throws down the camphor in crystals; similarly if a boiling solution of carbolated camphor is poured into cold water it instantly solidifies. It is miscible in all proportions with olive and almond oils. Chemical examination shows that the carbolic acid and camphor are not altered, and that they preserve all their properties in the solution.

## CONSOLATION FROM STATISTICS.—"And it is

really true that I shall recover!" asked a patient of his doctor. "Infinitely," answered the man of medicine, taking from his pocket a paper full of figures. "Here, look at the statistics of your case; you will find that one percent of those attacked with your malady are cured." "Well?" said the sick man, in a disinterested manner. "Well, you are the hundredth person with this disease that I have had under my care, and the first 99 are all dead."

NEWS IN BRIEF on page 380 and other pages.

## NEW ADVERTISEMENTS.

Assessment Notice—Summit Mining Co.

## The Week.

The past week has, like several preceding ones, been a disappointment with regard to the important question of rain, in which not only the miners and farmers but the whole community are vitally interested. Several times the clouds have banked up to the southward with every indication of rain, but the wind has invariably veered round to the northward and dispelled the clouds. It is not yet too late, however, for bounteous showers, and we can only hope that they will come quickly, be abundant and last a long time. A good heavy rainstorm would stimulate business of all kinds.

The Legislature will hardly settle down to vigorous work until after the appointment of a United States Senator, with which, as we write, the members are engaged. A number of bills have been introduced, but there has been little discussion as yet. We give an abstract of the Governor's message in another column.

Important news comes to us from the seat of war in Europe in the announcement of the fall of Plevna. This is a great victory for the Russians, the Turks, however, only yielding when starvation stared them in the face, and even then after desperate resistance.

The principal events of the week in mining circles is in connection with the Justice mine investigation, referred to elsewhere. It seems an unusually aggravated specimen of mismanagement, as far as present developments show. The Legislature, if it follows the advice of Governor Irwin, will take up the question of mining incorporations and mining stocks, and it is to be hoped that some radical reforms will be inaugurated.

ACCORDING to the returns of the Keeper of Mining Records, upward of £70,000,000 worth of mineral wealth was raised in Great Britain and Ireland during the year 1876.

SHOT CREEK, Kansas, says she has produced 19,000,000 pounds of lead since the first mineral was discovered there.

THE New York coal companies have advanced the price of coal from 30 to 50 cents on the ton.

## Looking after Mine Managers.

Some Eastern capitalists who invested in Utah mining property and did not realize the profits they expected, have gone after the resident manager of the companies, and are about overhauling him in the courts. Associated Press dispatches from Salt Lake state that 11 cases were brought in the District Court last week against Liberty E. Holden, formerly of Cleveland, Ohio, and four corporation defendants, by stockholders residing in Cleveland and Toledo, Ohio, and Detroit and Kalamazoo, Michigan. The suits involve the title and produce of a group of valuable mines in Bingham, Utah, known as the "Old Telegraph" mines. It is stated that Holden has realized from the working of these mines during the last 18 months over \$1,000,000. The actions are brought to rescind pretended purchases of stock from Eastern stockholders by Holden while he was acting as general manager of the companies, based upon alleged suppression of knowledge of the fact that the mines were largely productive, and the further fact of his misappropriation of

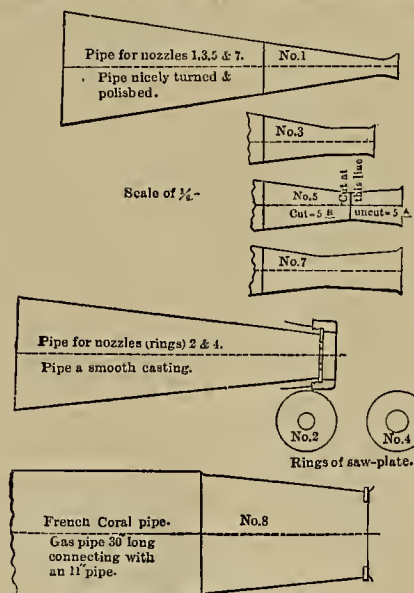

HURDY GURDY WHEEL.

large sums of money. It is claimed that the nominal sums of money paid to stockholders, on alleged purchases of the stock, belonged to them as dividends.

We know nothing whatever of the merits of the charges made, but feel called upon to deplore the fact that so many loose transactions are continually occurring in which the managers of mines are compromised, and the stockholders are the losers. In the case of Eastern or foreign investors delinquencies of this kind seem even more serious than in other cases, for

walk. When a fire breaks out the ladder may be unrolled by drawing it down with this chain. One or two men can then ascend to the roof to attend to the reel. Two hooks are attached to the lower end of the ladder, to which the hose can be attached and drawn to the roof. The ladder can then be used in the ordinary way. At the trial the other day a block was hooked on to the attachment on the cornice and the hose drawn up by a rope, the men going up the ladder.

It is intended that on all large buildings there

PIPES FOR NOZZLES.

the reason that such people are the very ones we desire to invest in mining property on this coast. So many good mines are lying idle for the want of capital to properly develop them that it seems a pity that the bad management or dishonesty of a few men should have the effect of deterring hundreds of persons from investing here. Every instance of this kind which comes to light has a bad effect on the company involved, and on the whole community.

We should like to see all delinquents in official positions in mining companies severely punished, both by fine and imprisonment. Put them in jail for obtaining money under false pretenses or conspiring to defraud. Three men in this city have just been held to answer to these charges in the Exchequer mine case, and if more frequent examples were made it would be better in every way for the community.

## Hammon's Patent Fire Escape.

We witnessed, on Wednesday, an exhibition of Hammon's patent fire escape, at the Russ house, on Pine street. This improved fire escape is intended as a permanent fixture on large buildings, so that the fire department, on their arrival at the building, can go immediately to the roof, or any story of the building, with their hose. It is used also for taking persons from burning buildings and for removing valuable property.

The escape is very simple in construction and operation. It consists of a ladder made of wire rope, with rounds made of gas pipe, through which run hars of wrought iron. This ladder is attached to a reel placed on the roof, a short distance back from the cornice. On the edge of the building is a small frame holding two pulleys, over which the ropes of the ladder travel. The ladder is kept rolled up on the reel when not in use, but a light chain is attached to the end and reaches down the side of the building to within a few feet of the side-

## HYDRAULIC MINING IN CALIFORNIA.\*

No. 10.

[By AUG. J. BOWIE, JR., A. B., Mining Engineer.]

## Experiments with Hurdy-Gurdy Wheel at North Bloomfield.†

As the hurdy-gurdy wheel is the outgrowth of hydraulic mining, the following table showing its efficiency may be interesting.

The wheel was 18 feet in diameter on outside, and 17 feet 4 inches in diameter to inner line of buckets (17 feet 8 inches in diameter at center line of buckets). The buckets were four inches deep, with flanges on each side.

The work done was measured by a Prony dynamometer, carefully made.

The head given shows the *real* head in feet at the point of discharge; that is, the head due to a discharge from a pipe of infinite size.

Description of Nozzle.	Diameter of nozzle in feet.	Head in feet at nozzle.	Discharge of water per second in cubic feet.	Velocity of water due to gravity.	Actual velocity of water at smallest diameter of nozzle.	Speed of wheel at center of buckets when running light.	Highest horse-power developed.	Ratio of work done to theoretical power of water.	Speed of wheel at center of buckets when giving most work.	Number of nozzles.

Nozzle.....	.0531	312.1	1110.14	133.7	13.5	13.5	5.87	59.8	20	

An experiment at the Empire mill, French Corral, was made under the following circumstances, giving the annexed results.

Ten stamps, weight of each, 693½ pounds. Drop, .768 feet. Speed of stamps, 62.2 drops per minute. Work done by 91.68 cubic feet of water per minute. Head, 130.1 feet. Size of wheel, 13½ feet outer diameter. Diameter of wheel, 12.53 feet to centers of buckets. Size of buckets, four inches wide and six inches deep, set 10 inches apart. Water conducted to wheel through an 11-inch pipe 866 feet long. The wheel was direct on the cam shaft, single cams used. The mill crushed 60 tons of gravel in 24 hours; one-quarter inch screens used.

Description of nozzle.	Diameter of nozzle in feet.	Head in feet at nozzle.	Discharge of water per second in cubic feet.	Velocity of water due to gravity.	Actual velocity of water at smallest diameter of nozzle.	Speed of wheel at center of buckets when running light.	Highest horse-power developed.	Ratio of work done to theoretical power of water.	Speed of wheel at center of buckets when giving most work.	Number of nozzles.
Ring.....	.1823	130.1	1,528	91.4	58.5	10.0	4.45	41.0	8	

The head at French Corral was the height of the water in pen stock above the nozzle, no allowance being made, as was the case in the Bloomfield experiments, for loss of head by friction in pipes and some leakage.

## Statistics of Yield of Gravel Fields.

Statistics showing the quantity of material washed and the corresponding yield in gold are rare, difficult to obtain, and, for the most part, unreliable. This is due, principally, to the fact that in the early days of placer mining in California, the question to be solved by the miner was not what the gravel would yield per cubic yard, and what it would cost to move it, but rather how many ounces of gold dust he could "pan out" or "rock out" between sunrise and sunset. All that he required was that the daily yield in dust should exceed the cost of living, etc. When it fell below this he moved his camp to other grounds.

The wonderful productions of the river bars and shallow placers attested by the early gold bullion and dust shipments from this State, created an extravagance usual to all new and rich mining countries, the baneful effects of which are still visible. Gold in such profusion is no longer found so conveniently scattered. The introduction of hydraulic mining requiring the assistance of capital has inaugurated a new era in gravel washing. Hence all data of the yield and costs of working gold bearing surface deposits become valuable, and accordingly the following tables have been added:

\* A paper read before the American Institute of Mining Engineers of the Wilkes-Barre meeting, May, 1877.

† These experiments were made at the N. B. G. M. company's works by Hamilton Smith, Jr., C. E., and as they are the only experiments of the kind made with the hurdy-gurdy wheel, they are here given.

Table No. 1.—Showing the Yield of Gravel Per Cubic Yard at Various Hydraulic Claims.

NAME OF CLAIM.	LOCATION	NUMBER CUBIC YARDS WASHED.	GROSS YIELD.	YIELD PER CUBIC YARD.	HEIGHT OF BANKS FEET.	AUTHORITY.	REMARKS.

Government Greuburg.	243	791,100	4,575.57	33.3
Government Perm.	121	480,014	2,543.17	30.5
Other works in Ural.	81	743,625	3,340.73	25.0

\* These tables have been calculated from the official statements published in the *Berg-und huettenmaennische Zeitung* of April 20, 1877. The gold pounds have been figured from the Russian doll, which, according to the mint standard, is 760 fine. The number of yards washed has been estimated from the Russian pud. 100 puds have been assumed to equal 1,053 cubic yard. See *Berg-und huettenmaennische Zeitung*, January 19, 1877. On this basis the cubic yard gravel weighs 3,307 pounds avoirdupois. The cement gravel of Nevada county, Cal., will approximate 3,600 pounds avoirdupois per cubic yard.

## The Governor's Message.

The Message of his Excellency Governor Irwin was submitted to the Legislature at the close of last week. It is an able document, exhibiting a thorough study into the material interests of the State, and even those who do not agree with him as to specific policies and measures, concede to him the credit for honest and clear expression of matters which he deems for the public good. The message is quite long and we can but note the leading points. The full document will be printed by the State and can be had on application by those who desire to make a careful study of its recommendations.

After fitting allusion to the impediments to industrial progress occasioned by the unfavorable season, the Governor discusses the financial status of the State and then the rate of taxation last year, as compared with former years. For the future the message recommends as follows: "I cannot too strongly urge on the Legislature the greatest circumspection and the most rigid economy compatible with the public honor and the public interests in making such appropriations. If there is one demand which universal public sentiment at this time emphasizes more than another, it is the demand for retrenchment and economy in public expenditure."

Concerning the State board of equalization the Governor deprecates the sweeping away of the original board, and expresses at length his "views on the necessity of some central author-

ity, with power to equalize assessments, made by county or district assessors. \* \* \* And it is to be sincerely hoped that in any new Constitution which may be framed for the State, care will be taken that, if it does not provide itself for the establishment of the necessary machinery to secure equal and impartial assessments of property, it shall at least not contain provisions inhibiting the Legislature from creating such machinery."

On the subject of public schools, the message gives the Superintendent of public instruction much credit for his efforts to improve the methods of teachers and raise the character of schools. It concurs in the Superintendents recommendation in favor of the High schools as a part of our school system.

The governor gives close attention to the affairs of the State lunatic asylums and the State prisons, for the points of which we must refer readers to the document itself.

The State University, the Governor says, has made gratifying progress considering the limited resources which it has had at command. Concerning appropriations for this institution he says: "It will be necessary, to some extent, to supplement the revenues of the University by appropriations from the State Treasury. But such appropriations should be asked for only in cases of the most urgent necessity, and should be granted only to the extent of such necessity. It cannot be denied that a large body of tax-payers regard with ill-concealed hostility all propositions for large appropriations from the State treasury for an institution, the direct and immediate benefits of which must, from the very nature of the case, inure to but a very small per centage of the youth of the State. These appropriations, if frequent and for large amounts, may be, and doubtless will be, used by the opponents of the

University to excite among the people, at large, hostility to the institution itself. While the Legislature ought not, in my judgment, to refuse all appropriations to the University, it ought to make them only for such necessary objects and in such reasonable amounts as may be requisite to its continued usefulness and growth."

A general approval of Prof. Hilgard's efforts for the building up of the department of agriculture is given and, in conclusion, the Governor says: "All things considered, the progress made toward the establishment of a University, ought in my judgement, to be satisfactory to the people of the State; and, also, that I should regard any serious attempt to reorganize it on a different basis, or to change radically its character, as a very grave mistake."

In regard to the Chinese question, the Governor says the plain duty of the United States is to abrogate the Burlingame Treaty.

The Governor accepts the fact that the last election ordered a constitutional convention and points out the duty of the present legislature in arranging preliminaries for its session. As to choosing members of the convention, the Governor favors each senatorial and assembly district choosing its own representatives rather than by general ballot throughout the State. He thinks also that the member should be fairly paid for their services because he doubts not that "In some districts, the citizen best qualified to be a member of the Convention, and possessing the confidence of the electors of the district in the greatest degree, may be too poor to give his time without pay."

The message concludes by recommending that inasmuch as a constitutional convention will be held, the present Legislature should enact only such laws at this session, as the public exigencies imperatively demand.

### The Great Floras of America.

The first fruits of last summer's visit of distinguished scientists to our coast, under the auspices of Prof. Hayden's survey, are beginning to appear. We have had the advantage of examining an advance abstract of Prof. Hayden's report of the summer's work, and thus gain for our readers the earliest information on a very interesting and important subject. The hotany of the survey was represented the past season by the two great masters of that department, Sir Joseph D. Hooker, Director of the Gardens of Kew, England, and President of the Royal Society of London, and Prof. Asa Gray, of Cambridge, Massachusetts. Their examination extended over a great portion of Colorado, Wyoming, Utah, Nevada and California. Their investigation into the alpine floras and tree vegetation of the Rocky mountains and Sierra Nevada enabled them to give a clear idea of the relation and influence of the climatic conditions on both sides of the great mountain ranges. Sir Joseph Hooker, whose botanical researches embrace the greater part of Europe; the Indies, from the Bay of Bengal across the Himalayas to Thibet; the Antarctic region and the southern part of South America; New Zealand, Australia, South Africa, Morocco and Asia Minor presents in the English periodical *Nature*, for October 25th, an outline of his studies during the season, and this outline, when filled out, will form a most important report for the eleventh annual report of the Hayden Survey. It will be seen at a glance that the report will be of a most comprehensive character, and cannot fail to be of the highest interest to our people. The tree vegetation, and especially the conifers, were made special objects of study, and many obscure points were cleared up.

Of a section of the Rocky mountains, comprising Colorado, Wyoming and Utah, Dr. Hooker says: "Such a section of the Rocky mountains must hence contain certain representatives of three very distinct American floras, each characteristic of immense areas of the continent. There are two temperate and two cold or mountain floras, viz.: 1. A prairie flora, derived from the eastward. 2. A so-called desert and saline flora, derived from the west. 3. A sub-alpine; and, 4, an alpine flora—the two latter of widely different origin, and in one sense proper to the Rocky mountain ranges."

The principal American regions with which the comparison will have first to be instituted are four. Two of these are, in a broad sense, humid; one, that of the Atlantic coast, and which extends thence west to the Mississippi river, including the forested shores of that river's western affluents; the other that of the Pacific side, from the Sierra Nevada to the western ocean; and two inland, that of the northern part of the continent, extending to the polar regions, and that of the southern part, extending through New Mexico to the Cordillera of Mexico proper.

The first and second (Atlantic plus Mississippi and the Pacific) regions are traversed by meridional chains of mountains approximately parallel to the Rocky mountains; namely, on the Atlantic side, by the various systems often included under the general term Appalachian, which extend from Maine to Georgia, and on the Pacific side by the Sierra Nevada, which bounds California on the east. The third and fourth of the regions present a continuation of the Rocky mountains of Colorado and Utah, flanked for a certain distance by an eastern prairie flora extending from the British possessions to Texas, and a western desert or saline flora, extending from the Snake river to Arizona and Mexico. Thus the Colorado and Utah floras might be expected to contain representatives of all the various vegetations of North America, except the small tropical region of Florida, which is confined to the extreme southeast of the continent.

The most singular botanical feature of North America is unquestionably the marked contrast between its two humid floras, namely, those of the Atlantic plus Mississippi, and the Pacific one; this has been ably illustrated and discussed by Dr. Gray in his various communications to the American Academy of Sciences and elsewhere, and he has further largely traced the peculiarities of each to their source, thus laying the foundations of all future resources into the botanical geography of North America; but the relations of the dry intermediate region, either to these or to the floras of other countries, had not been similarly treated, and this we hope that we have now materials for discussing.

Dr. Hooker sums up the results of the joint investigations of Dr. Gray and himself—aided by Dr. Gray's previously intimate knowledge of the elements of the American flora—from the Mississippi to the Pacific coast: "that the vegetation of the middle latitudes of the continent resolves itself into three principal meridional floras, incomparably more diverse than those presented by any similar meridians in the Old World, being, in fact, as far as the trees, shrubs and many genera of herbaceous plants are concerned, absolutely distinct. These are the two humid and the dry intermediate regions, above indicated."

Each of these, again, is subdivisible into three, as follows:

1. The Atlantic slope plus Mississippi region, subdivisible into (A) an Atlantic, (B) a Mississippi valley and (V) an interposed mountain region with a temperate and sub-alpine flora.

2. The Pacific slope, subdivisible, into (A) a

very humid, cool forest-clad coast range; (B) the great hot, drier California valley formed by the San Juan river flowing to the north and the Sacramento river flowing to the south, both into the Bay of San Francisco; and (V) the Sierra Nevada flora, temperate, sub-alpine and alpine.

3. The Rocky mountain region (in its wildest sense extending from the Mississippi beyond its forest region to the Sierra Nevada), subdivisible into (A) a prairie flora; (B) a desert or saline flora; (V) a Rocky mountain proper flora, temperate, sub-alpine and alpine.

As above stated, the difference between the floras of the first and second of these regions, is specifically, and to a great extent generically absolute; not a pine or oak, maple, elm, plane or birch of Eastern America extends to Western, and genera of 30 to 50 species are confined to each. The Rocky mountain region again, though abundantly distinct from both, has a few elements of the eastern region and still more of the western.

Many interesting facts connected with the origin and distribution of American plants and the introduction of various types into the three regions, presented themselves to our observation or our minds during our wanderings; many of these are suggestive of comparative study with the admirable results of Heer's and Lesqueren's investigations into the pliocene and miocene plants of the north temperate and frigid zones, and which had already engaged Dr. Gray's attention, as may be found in his various publications. No less interesting are the traces of the influence of a glacial and a warmer period in directing the course of migration of Arctic forms southward, and Mexican forms northward in the continent, and of the effects of the great body of water that occupied the whole saline region during (as it would appear) a glacial period.

Lastly, curious information was obtained respecting the ages of not only the big trees of California, but of equally aged pines and junipers, which are proofs of that duration of existing conditions of climate, for which evidence has hitherto been sought rather amongst fossil than amongst living organisms.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

### TO QUERISTS.

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, ALL free to parties who address this office on matters of more interest to themselves than to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

P. S.—Persons receiving this notice by letter will please take it kindly (under the fifth rib), and be sure to STAMP us—(but not too hard)—by return mail.

### The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE—bound in cloth, \$10.50; in leather, \$12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by DEWEY & CO.

### OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.  
B. W. CROWE—California.  
A. C. KNOX—Pacific Coast.  
C. N. WEST—Santa Cruz, Monterey and San Benito counties.  
A. C. CHAMBERLAIN—Fulard, Fresno and Inyo counties.  
JOSEPH DIMMICK—Mendocino, Humboldt and Del Norte counties, and Oregon.  
W. D. WHITE—San Bernardino and Los Angeles counties.  
J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.  
B. E. LLOYD—Alameda, Contra Costa and Napa counties.  
E. M. DENNY, Oregon.  
F. B. ALDERSON, Nevada.

### Thanks for Six Patents, Etc.

SACRAMENTO CITY, November 23, 1877.  
MESSRS. DEWEY & CO.—Dear Sir:—Please accept my thanks for the prompt and successful manner with which you have conducted my business in obtaining patents for fire brick, and for a smelting and condensing furnace, making six patents I have obtained through your patent agency. Four of the above patents were for the purpose of saving fine gold, quicksilver and amalgam, and the concentration of ores of all kinds. I can cheerfully recommend the firm to all with whom I may come in contact, especially inventors. I remain, respectfully yours,  
GEO. R. EVANS.

THE BEST FILEDOLDER.—After having used Dewey's patent elastic hinge folder for over a year past, the *News* cheerfully indorses it as the best newspaper folder in existence, possessing important advantages over any and all others in use. The folders are neat, light and convenient, and the newspapers are placed in them with the utmost facility and least possible time and exertion. They are the simplest, handiest and cheapest of all. Anybody keeping files of papers in reading rooms, offices or at home, should send at once to the proprietor, A. T. Dewey, San Francisco, and get the only proper folder. Samples by mail fifty cents.—*Gold Hill News*.

### UNITED STATES Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Surveys; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

### Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

Map of California and Nevada; The Public Lands; The Land Districts; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.

Instructions of the U. S. Land Commissioners.—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College Scrip; Pre-emptions; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissioners; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

Abstract from the U. S. Statutes.—The Law Concerning Pre-emption; Concerning Homesteads; Amendment Act Concerning Timber; Miscellaneous Provisions; Additional Surveys; Land for Pre-emption; List of California Post Offices. Price, post paid, 50 cts.

Published and sold by DEWEY & CO., S. F.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and the subscribers against the acts and mistakes of others.

### SCRIBNER'S LUMBER and LOG-BOOK. OVER HALF A MILLION SOLD.

Most complete book of its kind ever published. Gives correct measurement of all kinds of lumber, logs and plank by Doyle's rule, cubical contents of square and round timber, stave and heading bolt tables, wages, rent, board, capacity of disterns, cord-wood tables, interest, etc. Standard book throughout United States and Canada. Ask your bookseller for it, or I will send one for 35 cents, post-paid. G. W. FISHER, P. O. Box 233, Rochester, N. Y.

SOLD ON THE PACIFIC COAST BY

DEWEY & CO., San Francisco.

And mailed post-paid on receipt of 35 cents in currency or postage stamps.

### MINING LAWS AND DECISIONS.

Copp's Hand Book of Mining Laws.

In this little work is given the United States Mining Laws and Instructions. Also, a digest of the decisions under the laws, by the Secretary of the Interior and Commissioner of the General Land Office.

Forms are given for making out notice of location, proof of labor, application for survey, and in fact all the blanks a miner needs.

There is also a list of all the mines for which U. S. Patents have been obtained from July, 1866, to August, 1877, with location, township and range.

A handy companion for miners. Price \$1, post paid. Address

DEWEY & CO.,  
202 Sansome Street, S. F.

**\$1,500.**

Any person wishing to make a good investment of the above sum in a well promising legitimate mining enterprise in California, will be directed to the parties wishing to sell upon addressing this office.

PALACE J. V. Websters large, fine, new Dining Rooms are exceedingly popular. The best RESTAURANT of everything on the tables. Dinner furnished at the low price of 50 cents. NO. 218 SANSOME ST., S. F. FIFTY CENTS, from five to eight p. m. Visitors to S. F. should try the Palace.

WIND MILL. One of the best made in this State for sale cheap on easy terms. Address, W. T., care of Dewey & Co., S. F.

### TAXES. TAXES. 1877-1878.

Notice is hereby given, that a certified copy of the Assessment Book of the Taxable Property of the City and County of San Francisco, Real Estate and Personal Property (Subsequent Assessment Book included), for the Fiscal Year 1877-78, has this day been received; that the State, City and County TAXES for said fiscal year are now due and payable at the office of the undersigned, Room No. 1, City Hall, and the Laws in regard to their collection will be strictly enforced.

Taxes will become delinquent on the FIRST MONDAY in January, 1878, and unless paid prior thereto, Five per cent. will be added to the amount thereof.

WM. FORD,

Tax Collector of the City and County of San Francisco.

SAN FRANCISCO, October 22, 1877.

### Montgomery Avenue Tax.

Notice is hereby given that a certified copy of the Assessment Book of Real Estate, which is subject to Assessment to defray expenses incurred by the opening of Montgomery Avenue, has this day been placed in my hands to collect Taxes thereon.

Said taxes are for the Fiscal Year 1877-78, and are now due and payable at the office of the undersigned, Room No. 1, City Hall. All Taxes remaining unpaid on the FIRST MONDAY of January, 1878, will have Five per cent. added thereto.

WM. FORD,

Tax Collector for the City and County of San Francisco.

SAN FRANCISCO, October 22, 1877.

### ASSESSMENT OF LANDS Benefited by Widening Dupont St.

Notice is hereby given, that a certified copy of the Assessment Book of the Real Estate which is subject for the payment of Principal and Interest upon "Dupont-Street Bonds," as directed by an Act of the Legislature of California to authorize the Widening of Dupont Street in the City of San Francisco, "Approved March 23, A. D. 1876," has this day been placed in my hands for collection. The Laws in regard to the collection of the same will be strictly enforced.

WM. FORD,

Tax Collector of the City and County of San Francisco.

SAN FRANCISCO, October 22, 1877.

### ARITHMETIC MADE EASY. ROPP'S EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months. The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Granaries, Bins, Wagon Beds, Corn Cribbs; a Time, Wage and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mechanical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided. The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00. Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter or receipted by express. Address

DEWEY & CO., San Francisco.

YOUR NAME printed on 50 mixed cards for 13c. 25 for  
 cards 10c. CLINTON BROS., Clintonville, Conn.

Among the advantages gained by this holder are the  
 following:

It can be opened and closed quickly.

The points are less obstructed while the articles to be  
 filed are being placed.

The papers (wholly or partly folded) can be either  
 "straddled" over the lower bar, or filed in regular  
 order.

The elastic hinge and band accommodate and hold firm  
 either a large or small number of papers.

With less material, it is lighter and less cumbersome  
 than other holders, and approaches nearer to bookbinding.

It has no rigid hooks, hinges or loose parts to break or  
 get lost.

It has proved durable in practice. The file is adjusted  
 but 52 times a year for a weekly paper, and a sample  
 holder can be opened and closed 1,000 times without  
 showing wear.

Five sizes are made to suit the dimensions of different  
 papers, viz.: 15, 22, 26, 30 and 34 inches, inside measure.

Single samples will be mailed from this office for 50  
 cents, postpaid. Wholesale and retail agents wanted.

## Buy the Best.

Before purchasing an American  
 Watch, examine the different styles  
 manufactured by the **HAMPDEN**  
**WATCH COMPANY**, at Springfield,  
 Mass. They are the latest and  
 best improved manufacture. You  
 can depend upon them for fine finish,  
 durability and perfect time. They  
 are sold at favorable prices—in  
 fact, no higher than many of the  
 inferior styles. Examine into the  
 merits of this Watch before you  
 buy any other. Our word for it,  
 you will not regret it.

American Watches a  
Specialty.

## ARTIFICIAL LIMBS.

**MENZO SPRING,**

MANUFACTURER OF

**ARTIFICIAL LIMBS.**

OFFICE AND ADDRESS,

9 Geary St., San Francisco.

Descriptive circulars, blanks for  
 measurements, with instructions and  
 price list free on application.

25 ELEGANT CARDS, no two alike, with name, 10  
 cents, post paid. J. B. HUBBARD, Nassau, N. Y.

## Metallurgy and Ores.

## Nevada Metallurgical Works,

No. 23 STEVENSON STREET,  
 Near First and Market Streets.

Ores worked by any process.

Ores sampled.

ASSAYING in all its branches.

Analysis of Ores, Minerals, Waters, etc.

WORKING TESTS MADE.

Plans furnished for the most suitable process  
 for working Ores.

Special attention paid to Examinations of  
 Mines; plans and reports furnished.

## ASSAYERS' MATERIALS.

CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
 GISTS' GLASSWARE AND SUNDRIES, Etc.

512 & 518 Washington St., San Francisco

We would call the special attention of Assayers, Chem-  
 ists, Mining Companies, Milling Companies, Prospectors,  
 etc., to our stock of Clay Crucibles, Muffles, Dry Cups,  
 etc., manufactured by the **Patent Plumbago Crucible**  
 Co., of London, England, for which we have  
 been made *Sole Agents for the Pacific Coast*. Circulars  
 with prices will be sent upon application.

Also, to our large and well adapted stock of

## Assayers' Materials &amp; Chemical Apparatus,

Having been engaged in furnishing these supplies since  
 the first discovery of mines on the Pacific Coast.

Our Gold and Silver Tables, showing the value per  
 ounce Troy at different degrees of fineness, and valuable  
 tables for computation of assays in grains and grammes,  
 will be sent free upon application.

**JOHN TAYLOR & CO.**

## LEOPOLD KUH,

(Formerly of the U. S. Branch Mint, S. F.)

## QUARTZ MILL AND MINE

## FOR SALE.

The Quartz Mine situated on Humbug Creek, Siskiyou  
 County, Cal., known as the New Eliza Mine, together  
 with a

Fifteen-Stamp Mill Complete,

A twenty-five horse-power steam engine, and all the ap-  
 purtenances thereto belonging, will be sold at a bar-  
 gain if applied for soon. For further particulars apply  
 to

C. JUNKER,

Bella Union Saloon, Yreka, Cal.

## TIRILL'S UNDERGROUND METRE.

## GAS MACHINES

If you are examining Gas Machines it will be a great  
 mistake not to send for the circular of the simplest and  
 most effective Gas Machine ever invented.

METRE GAS MACHINE, 39 Dea St., N. Y.

Continued from Page 373.

surprised both as to size of vein and quantity and quality of ore extracted and now on the dumps. The vein is not, as has been generally supposed—in minor's parlance—a "small, rich strata," but it is a good, strong vein, the ore streak running from six inches to two feet in width, the lowest workings showing the largest ore vein. Both the north and south mines can be worked by tunnels run in on the vein to the depth of 350 feet. There are now about 350 tons of high-grade ore on the dumps.

For.—This mine is developing splendidly; ore vein increasing in size and improving in quality as depth is attained.

CASCAD.—Sinking actively on this mine, with a better showing than ever.

SWILLING.—Very fine sulphuret ore struck in the shaft, which is being sunk on contract.

ISABELLA.—Sinking shaft suspended for the present for want of timbers. Rich ore being extracted from open cut. The shaft, now 65 feet deep, has produced no ore for the last 20 feet. This seems characteristic of nearly all the mines in this district. At a depth of 20 to 50 feet the ore gives out, but in all cases where sinking has been continued, richer ore and more of it has been developed.

THERE are a number of miners in the hills, some working on old locations others prospecting for new ones. All of them have their pockets full of rich specimens. Humboldt district has all the characteristics of a rich mineral country.

PECK DISTRICT.—In the Black Warrior the drift is 130 feet from the surface. Sinking will be resumed to north vein in heavy ore, showing the usual amount of sulphuret and native silver. Contract let to sink and drift; drifting commenced to-day.

PECK.—Rich ore in bottom of main shaft, about 60 feet below north tunnel.

CASTLE DOME.—*Arizona Sentinel*, Dec. 8: Castle Dome improves. The Arkansas has turned out 30 tons of clean lead in less than 20 days and has on the dumps over 10 tons of specimens, weighing from 100 to 700 pounds each. The district is suffering from want of transportation, although another heavy team has been sent up there this week. Bettis says he has now known Castle Dome for 14 years and never saw it looking so well. At the various mines there are now over 100 tons of lead ahead of the teams and some 50 tons at the river ahead of the steamboats.

## Colorado.

WARSAW.—*Sunshine Courier*, Dec. 8: Continuing to get such rich ore in the upper tunnel, the owners of the Warsaw concluded, a few days since, to go back to the lower tunnel and push it through to the chimney they have been working above. Already the zinc, which made its appearance in the lower tunnel in the last working, a few weeks ago, is giving away to tellurides.

THE Corning tunnel is now in about 1,080 feet. It is worked by night and day shifts of single-handed workers—two working side by side in the breast each shift. They are making eight feet per week, and having already reached the point at which it was expected they would cut the slide lode, it cannot be long before it will be tapped. All told, the tunnel employs 14 hands. They are shipping ore by freight.

THE Silver Wing cluster of lodes, in the San Juan country, is justly a noted piece of mining property. It embraces over 30 distinct veins, all within the limits of one tunnel site and averaging two and a half feet of mineral each. Patents have been secured on enough of the lodes to cover the whole surface of the tunnel site, and every development so far made only adds to the great prospective value of the property. The different veins at the surface have assayed from 15 ounces to 2,700 ounces of silver per ton. Ten blind lodes have already been cut, which, in connection with the veins already known to exist, go to show the whole mountain to be a perfect network of mineral. It is owned by leading citizens of Colorado Springs, who have incorporated it into a company, and who, having pushed operations in the past, will continue to do so in the future.

## Idaho.

THE MINES.—Owyhee *Avananche*, Dec. 8: The mining situation here is daily growing brighter. At the Golden Chariot the crosscut on the 15th level has been started and the work is going ahead finely. Mr. Sands has 17 men at work in the Illinois Central, who are taking out \$40 rock from the third and fourth levels. Some idle wild rock is being crushed at the Leonard mill, which will yield \$120 to the ton. The Black Jack is looking better every day. There is no change in Empire matters, but assurances have been received from below that the mine is to be started up again in a few days. The Potosi will also probably start up soon under new auspices. Three men have taken out nearly \$3,000 from operations in the Whiskey mine since the 1st of May, and many small mines in the vicinity are yielding well.

## Utah.

FRISCO.—*Cor. Salt Lake Tribune*, Dec. 8: Frisco is sure to be a big and thriving place. Already there are over 500 inhabitants, and it will double in three months from today, for the mineral wealth is here to develop it.

THE leaching works are fast approaching completion.

MR. WILLIAMS, of Williams & Co.'s smelter at Millford, who is said to be the most successful person in Utah in the working of difficult and rebellious ores, is to take charge of the smelters here. They are fast approaching completion and will be the most complete in Utah, with plenty of wealth to back them.

BENHAM.—Like the majority of mining camps at the present day, Benham feels the pressure of hard times, yet instead of becoming disheartened, it seems to have the effect upon her miners to redouble their exertions to open out their claims.

CONSIDERABLE developments are being made in the vicinity of Carr fork, and some rich ore is being extracted. This portion of Bingham is attracting considerable attention, and well merits it. C. A. Lyndon has struck it big in the Mormon Nell. Assays show up in the hundreds. The mine is at present being worked on lease.

THE Ashland is still driving ahead with their tunnel, and the prospect seems good for ore. The Neptune at present remains idle.

LIVE YANKEE, leased by Wm. Jackson, is turning out some fair ore, and the outlook is very encouraging.

THE Aladdin is working on lease. A tunnel is being run to tap the vein, and is now in about 130 feet.

## PATENTS AND INVENTIONS.

### List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING NOVEMBER 27TH.

BESK.—John F. Boye, Cal.  
CONSOLIDATION PADLOCK.—W. R. Young, Healdsburg, Cal.  
TIMING ATTACHMENT FOR RACING VEHICLES.—John L. Boone and E. J. Fraser, S. F.  
STONEWARE KILNS.—C. Gladding, Lincoln, Cal.  
CAR WHEELS.—H. S. Smith, S. F.

THE patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

## Legislative Committees.

The following are the standing committees of the Assembly appointed by the Speaker:

On Public Lands.—Welsh, Hanna, Breen, Wheat, Blackwell, Knott, Sherman, May and Smyth.

On Public Expenditures and Accounts.—Hinsaw, Nott, Smyth, McClure and Johnson.

On Commerce and Navigation.—Haworth, Asmussen, Dixon, Griffith and Dare.

On Hospitals.—Montague, Mayfield, Thompson, Murphy of San Francisco and Wilson.

On Judiciary.—Anderson, Waters, Barstow, Holloway, Murphy of Del Norte, Coffey, Hart, Dewitt, Welsh, Swift and Breen.

On Claims.—Ostrom, Hinsaw, Garver, Thompson, Smith, McComas and Blake.

On Irrigation.—Ewing, Myers, Young, Dorsey, Mace, Routier and Sherman.

On State Prison.—Miller, Moffat, Griffith, Broderick, Allen, May and Abbott.

On Swamp Lands.—Hart, Ostrom, Haile, Dewitt, Ewing, Brooks, Adams, Kercheval, Sargent, Robinson and Ames.

On Public Morals.—Adams, Ellis, Gough, Blake and Ames.

On Mileage.—Hicks, Griffin and Conway.

On State Library.—Tobin, May and Johnson.

On Indian Affairs.—Robinson, Murphy, of Del Norte, afterwards excused, Adams, Pauly and Russ.

On Grape Culture.—Mayfield, McComas, Routier, McClure, Wheat, Hinsaw and Ames.

On Rules and Regulations.—Barstow, Gildea, Murphy, of San Francisco, Abbott and Backus.

On Public Printing.—Upton, Gough, Pace, Coffey, Conroy, Farnum and Connolly.

On Roads and Highways.—Wheat, Ludgate, Hugg, Cooley and Whitlock.

On Mines and Mining Interests.—Blackwell, Byington, Hugg, Wheat, Dunlap, Moffat and Wilson.

On Engrossment.—Young, Asmussen, Dare, Denni and Brooks.

On Enrollment.—Broderick, Neally, Long, Farnum and Russ.

On Elections.—Neally, Holloway, Griffin, Ellis, Griffith, Forsyth and Brooks.

On Military Affairs.—Dorsey, Tobin, Backus, Denni and Dare.

On Ways and Means.—Mott, Gildea, Waters, Garver, Kercheval and Tuttle.

On Corporations.—Tuttle, Waters, Haile, Haworth, Garver, Dixon, Meyers, Swift and Nott.

On Internal Improvements.—Dunlap, Blake, Mace, Forsyth and Brooks.

On Public Buildings.—Dixon, Upton, Ludgate, Connolly, Forsyth, Byington and Long.

On Counties and County Boundaries.—Pace, Montague, Warden, Mayfield, Ewing, McComas and Cooley.

On Federal Relations.—Gildea, Anderson, Murphy, of Del Norte, Swift, Barstow, Moffat and Johnson.

On Education.—Haile, Tuttle, Young, Upton, Pauly, Hicks and Ahott.

On Agricultural, Mining and Mechanic Arts College.—Tobin, Broderick, Warden, McClure, Sargent and Whitlock.

Mr. Murphy, at his own request, was excused from service on the Committee on Indian Affairs.

### Senate Committees.

The following comprise the standing committees of the Senate:

Agriculture.—Hill, Montgomery, Crane, Flint Coleman.

Claims.—McCoppin, P. W. Murphy, Norton, Pierson, Smith.

Commerce and Navigation.—Howe, McCoppin, Beazell, J. C. Murphy, Dean.

Contingent Expenses.—Rogers, P. W. Murphy, Whitney, Donovan, Crane.

Corporations.—Searls, Hirley, McCarthy, Gwin, Hilborn, Evans, W. H. Brown.

Engrossed Bills.—Craig, Howe, Hunt, B. D. Murphy, Ream.

Enrolled Bills.—McCarthy, Rogers, Angney, Boyston, Norton.

Federal Relations.—Lambert, Satherwhite, Hilborn, Searles, Norton.

Finance.—Angney, McCoppin, Gwin, W. H. Brown, Norton.

Hospitals.—Ream, Craig, Flint.

Internal Improvements.—Fowler, B. D. Murphy, McCarthy, Boyston, Coleman.

Judiciary.—McGarvey, Pierson, Curtis, Smith, Porter, Lewis, B. D. Murphy, Lambert, Craig.

Mileage.—Smith, Whitney, Angney.

Military Affairs.—Boyston, Evans, J. C. Murphy.

Mines and Mining.—Coleman, Gwin, Ream, F. M. Brown, Searles.

Public Buildings other than Prison Buildings.—Donovan, Firman, Goodwin, Beazell, Whitney.

Swamp, Overflowed and Public Lands.—Pierson, Fowler, Shirley, Evans, Dean.

Public Morals.—Montgomery, Donovan and Dean.

Public Printing.—J. C. Murphy, Porter, P. W. Murphy.

Roads and Highways.—P. W. Murphy, Crane, Hill.

State Library.—Curtis, J. C. Murphy, Norton.

State Prison.—Sbirley, Beazell, Whitney, McGarvey, Goodwin, Haymond, Nunan.

Irrigation and Water Rights.—Satterwhite, Fowler, Haymond, W. H. Brown, F. M. Brown.

Fisheries and Game.—Hilborn, Hill, Angney, J. C. Murphy, Nunan.

## News in Brief.

SMALLPOX has almost entirely disappeared from this city.

THE Turkish government has impressed the street car horses for the army.

THE New York police continue their raid on unlicensed liquor dealers.

THE National Exchange Bank of Troy, N. Y. has gone into voluntary liquidation.

AN investigation into the cause of the wreck of the *Huron* is in progress.

FRANCE offers \$500,000 in premiums at her Exposition next year.

THE debt of New York is \$130,000,000 to \$140,000,000; that of Paris, \$350,000,000.

OROVILLE cemetery is being undermined, so says the *Mercury*, by Chinese gold-miners.

DANIEL CREEDAN, a Sucker Flat miner, was killed by a cave on Tuesday night or Wednesday morning.

THE striking cigar makers are perfecting arrangements for a co-operative factory in New York.

DISPATCHES say that there is no truth in the story that Lerdo has renounced his claims to the Presidency of Mexico.

THERE are 52 prisoners in the House of Correction proper and 187 county jail prisoners in the institution.

A man named James Arthur was killed in the Consolidated Amador mine, Sutter creek last Sunday, by a cave.

THE amount of deposits in the Savings banks of the United States is estimated at \$1,500,000,000.

THE steamer *Oregon*, which will run from this city to Portland, Oregon, was launched this week at Chester, Pa.

THE property owned by the city of San Francisco, in park reservations, public squares, lots, buildings, etc., is valued at \$11,435,000.

JOHN W. YOUNG has been sued by his Eastern creditors, and his household goods in Salt Lake have been seized. They threaten to throw the Utah Western railroad into bankruptcy.

CONGRESSMAN DAVIS has presented to the House of Representatives a memorial of the San Francisco Chamber of Commerce, praying for an appropriation for a new Postoffice.

THE Tax-Collector's books show that the value of real estate, subject to taxation, in the city and county of San Francisco, is \$190,972,880, and the personal property, \$63,730,080.

THE City of Berlin has been towed into Liverpool by another Inman steamer. When within two days of Queenstown her shaft broke, which caused her delay.

THE brigantine *G. M. Jones*, from New York, for Halifax, has been run down at sea. All hands, except one seaman, were drowned.

THE street department fund of this city for the fiscal year is already exhausted, the \$300,000 intended for the year having been spent in six months.

THE Chicago *Tribune* has established a permanent agency in this city, the first Eastern paper which has done so.

ADVICES from Cape Town, dated Nov. 26th state that the government is granting lands in the Galeka country to Europeans and the volunteers are disbanding and returning to their homes.

DR. ALBERT T. BLEDSOE, editor of the *Southern Review*, a distinguished minister and former Professor of the University of Virginia, died at Alexandria, Va., on Saturday night of paralysis.

BLACKLOCK, of Gulf of California oyster canning fame, has been sentenced to the State Prison for seven years and nine months for forgery.

PETER B. SWEENEY has paid the last installment of \$400,000 and interest, which he agreed to pay New York in settlement of the Tweed ring suits against him.

A BILL has been introduced in Congress by Joyce, adjusting the salaries of Postmasters on the basis of the number of stamps cancelled instead of the number sold.

THE Postoffice Department has completed and is now issuing a printed advertisement in pamphlet form, inviting proposals for carrying mails on all routes on the Pacific coast States and Territories.

THE firm of Jno. G. Hodge & Co., well-known stationers of this city, have filed a petition in bankruptcy. Their indebtedness is \$280,000, with assets at \$240,000. The cause of the failure is attributed to dull times and investments in real estate in the interior which have not proved profitable.

MILAN is preparing for an International Exhibition in 1879. The outlay for the building, which is to be in the London Crystal Palace style, is set at the modest sum of \$150,000, two-thirds of which sum have already been subscribed in England and the rest in Italy.

LIEUT. WISE reports favorably on his official explorations of the Isthmus of Darien, with the view to the project of an inter-oceanic canal. He believes that it could be most easily executed directly from the valleys of the Tupisa and Tiatli to the Gulf of Uraba, and would not require any locks.

THE revolution in Ecuador has collapsed.

THE work of dredging Wilmington harbor is progressing.

WORK has been suspended on the Ironclad *Monadnock* at Mare island.

THEY are having good rains in Arizona, and farmers and miners are jubilant.

THE pile-drivers of this city have organized a benevolent association.

It is reported that Prince Bismarck has renewed his request to be relieved of office.

THE Board of Supervisors are asked to grant a franchise to a new gas company in this city.

COMPLAINTS are made that the settling up of the affairs of Tyler's defunct Collateral Bank is unnecessarily slow.

THE rifle match between the bank clerks last Saturday, was won by the Bank of California team.

DR. REINGER, physician of the Sutro Tunnel company, has died from injuries received by a fall from his horse.

THE London association has advised the syndicate that it proposes a subscription for \$10,000,000 in four per cent. bonds.

A Valisia dispatch states that Wells, Fargo & Co.'s box, containing \$225, was stolen on the 7th.

THE grading stakes of the railroad company have been placed to the foot of Fifth street—the main thoroughfare of Benicia.

FIRE MARSHALL DURKEE of this city was thrown from his buggy one day this week and badly bruised.

THE barge *Governor Hayes*, was snagged Saturday night in the river near Colusa, and 12,000 sacks of wheat belonging to Dr. Gleun were lost.

THE Ways and Means Committee will devote the greater part of the recess to continuation of their work upon the proposed new tariff and internal revenue bill.

EX-GOVERNOR PINCHBACK of Louisiana, has addressed an open letter to Governor Nicholls resigning his place as United States Senator from that State.

PLEVNA has surrendered to the Russians, after a severe engagement. Osman Pasha attempted to break through the lines but was compelled to lay down his arms.

MUSICAL sounds have been transmitted by means of a telephone to Columbus, O. from Chicago, a circuit of 375 miles. The longest distance yet tried.

ONE night last week a man entered a pawnshop on Clay street, and asked to be shown a watch. When he received it he threw a handful of pepper in the proprietor's eyes and escaped.

THE strike at Sheffield England, which lasted six weeks, during which time many outrages have been committed has ended. The men consented to a reduction of wages.

THE Senate Committee on Military affairs has authorized Maxey, of Texas, to report a bill to appropriate \$200,000 for the erection of suitable posts on the Rio Grande, to be located at the discretion of the Secretary of War.

PAGE's bill provides that Oakland shall be a port of delivery within the collection district of San Francisco, and that a Deputy Collector be appointed, to reside at Oakland, and receive such salary as the Secretary of the Treasury may designate.

THE Los Angeles *Herald*, December 6th, states that Jesus Gomez, and Virginia, while digging gravel in an arroyo in east Los Angeles for Hancock Johnson, came upon a box containing \$4,000 in gold dust, \$375 in coin and about \$1,000 worth of jewelry.

H. D. BACON of Oakland has offered his large and valuable art collection to the University of California, together with \$25,000, provided the State will add another \$25,000. He has also given to the University, without condition, his fine library, said to contain 10,000 volumes.

GIDDINGS, of Texas, will introduce a bill in the House to incorporate the Galveston and Camargo railway, to run from Galveston to Rio Grande city, 315 miles. A subsidy of \$2,125,000 is asked, which the company has 25 years to repay, and the road is to be built in 15 months.

ON December 19th, the creditors of Duncan's Bank will elect an assignee at the Register's office, No. 636 Clay street. Only those creditors can vote who shall then have proved their claims, and no others will be entitled to share in whatever dividend may be declared.

THE Southern Pacific Railroad Company has placed at the railroad crossing of Brannan, Bryant, Harrison, Folsom, Howard, Mission and Valencia streets, automatic electrical alarm bells, which give warning of the approach of trains.

THE ladies' Evangelical and Philanthropical society in this city will shortly open a reading room where working women and girls can pass their leisure hours pleasantly and profitably. The employment Committee of the society will also be represented there, and upon applicants making known their wants, every effort will be made by the Committee to procure work for them.

Mining Share Market.

The principal topic of interest in stock circles is the Justice mine investigation. The Committee investigating the affairs of the mine are still at work, and have made some exceedingly startling developments. The valuable portion of the Justice location has been decided away to the Alta company for a consideration of \$1, and the transaction kept secret from the stockholders. The records are found to be mutilated, a number of vouchers for supplies forwarded, wages paid, and milling expenses, are missing. Some 37 pages have been torn from the cash book. During the seven months for which the vouchers and accounts are missing the disbursements of the company amount to over \$2,000,000. It is shown that, according to the accounts, over \$3,000,000 in bullion has been taken from the mine in the last two years, and \$1,000,000 received from assessments; yet no dividends have been paid during that time. Business at the mine has been conducted in an exceedingly loose manner. A thorough investigation is to be made. The Justice company, through the attorneys, has commenced suits in this city against Schultz and Von Bargen to recover \$132,000, on two items, viz., \$60,001 in money of the company taken by the firm to pay an assessment of \$1 per share on 60,001 shares of the Woodville stock owned by the Justice, and \$72,000, money belonging to the Justice, admitted by Schultz to have been retained by him. The attachment suit covers all moneys deposited in the banks of San Francisco by defendants, and all stock known to be held by brokers for their account. It also covers the building on the corner of California and Front streets. There is an allegation in the complaint filed to the effect that the moneys unaccounted for by them will amount to \$500,000.

Outside of the excitement occasioned by the matters above referred to, the market has been pretty dull during the past week.

It is said that the reason no beef is being shipped to Europe at the present time is not that it does not arrive there in good condition, but because the London market is well stocked, the receipts from Ireland now averaging about 22,000 head of cattle per week.

THE Sub-Committee of the House Committee on Elections have concluded hearing arguments in the Louisiana, Massachusetts and California contests, but will not report upon them to the full Committee until after holding the recess.

MINERALS FOR PARIS.—Mr. J. Hatch has boxed for shipment some 10,000 mineral specimens for exhibition at the Paris exposition, and is engaged in collecting others. This collection attracted considerable attention at the Centennial.

TWENTY-FIFTH YEAR—1878.

Hall's Journal of Health.

Contents of a Single Number:

The Little Courtesies of Life; Coughing in Consumption; Influence of Christianity on Medical Science; Ignorance and Ill Health; Rage and Ruin; Kindness the Best Punishment; Grass in Run; Valuable Table; Incurable Insanity; Consumption—A Suggestion; The Spirit Rapper; Premium on Babies; Our Proverbs; Wrecked Clergymen; Marrying Well; The Lifting Cure; Sea Sickness; Face Painting; A Filthy Atmosphere; The Latest Crazy Man; A Suggestion; The Erie Railway; Sick Children.

Published in New York. E. H. GISS, M. D., Editor.  
This journal has maintained the highest record of any health journal issued in the English language. It is not the amount of matter published which makes it the most valuable journal, but the plain and condensed truths it furnishes concerning that which is of ever vital importance to its large list of readers.  
Annual subscription (post-paid).....\$1.50.  
To subscribers of this paper.....75 cents.

Address: DEWEY & CO.,  
No. 202 Sansome Street, San Francisco,  
Agents on the Pacific Coast.

Mining and Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free.

Address.

DEWEY & CO.,

202 Sansome St., N. E. Cor. Pine, San Francisco.

Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled. Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers, S. F.

Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals, etc. We have a first-class

Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick Silver, 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams, 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers, containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

**Advance Silver Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Monitor District, Alpine County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the twenty-first day of November, A. D., 1877, an assessment of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 16, No. 309 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the second day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the twenty-sixth day of January, 1878

## Attention, Mining Companies.

### RICKARD'S PATENT

Oxidizing and Chloridizing

### FURNACE,

FOR ROASTING

COPPER, SILVER &amp; OTHER ORES

Prior to Leaching or Amalgamation.

The most striking advantages which it offers above all other recent inventions of this nature may be briefly summed up as follows:

First.—Its cheapness, the cost of its erection (ex-royalty and freight) not exceeding \$1,500, for a capacity to roast and chloridize twenty tons per day, viz: brick work, \$1,000, and iron work, including blower, \$500.

Second.—Short time required for erection, viz: 14 days, after providing all materials, with a sufficiency of labor.

Third.—No expensive, heavy or complicated machinery being necessary, involving heavy freight to the district where it may be required. Brick and clay generally obtainable on the spot, being the chief materials required in its construction.

Fourth.—No skilled labor or technical experience is necessary to work it. Two ordinary laborers being sufficient to attend to it when in full operation.

Fifth.—It does not easily get out of order, and is readily repaired by an ordinary mason or blacksmith when it does.

Sixth.—The royalty, or license to use it, is exceedingly moderate, removing thereby all temptation to evade or infringe the patent.

Seventh.—Calculating labor at \$3 per day, and wood at \$6 per cord, the cost of roasting is but little over \$1.50 per ton (ex-salt when chloridized), at these high California rates for labor and fuel.

One of them is now in the course of erection by the Aztec Gold and Silver Mining Company, at their mill in the Aztec District, Santa Rita mountains, Southern Arizona. At their office, 302 Montgomery Street, rooms 14 and 15, a model may be seen, and working drawings, with all further information necessary to enable any ordinary mason to construct the furnace, may be obtained from

COL. J. D. GRAHAM.

Pamphlets, with illustrations and full description, sent on application.

(Room 10.)

## THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 24 cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in Peavine District, Nev., and at the Exchequer mill, Alpine Co., Cal. For further information, apply to

D. J. O'HARRA,  
Reno, Nevada.

## Steel Castings,

## To Mill and Mine Owners.

Having made arrangements with competent and reliable parties in Washington City, by which we will be able to secure prompt and careful attention to our business, we are now prepared to assist Mill and Mine, Canal and Ditch owners in securing patents for their lands, mines and claims, in addition to our former line of patent business.

Many who are acquainted with the manner in which this business has heretofore been conducted, (with or without assistance by local attorneys,) will see at once the great advantage of patronizing an establishment that is thoroughly organized and has its representatives in Washington to look after and prosecute their applications before the Commissioner of the General Land Office. The business on this Coast will be attended to by JOHN L. BOONE, Esq., Attorney-at-Law, one of the members of this firm.

Correspondence from persons desirous of securing patents for Lands, Mines, Mill Sites, Canal and Ditch property, promptly attended to.

We have the best Imitation Gold Watch in the Market for Trading Purposes. The metal is a composition of other metals, so closely resembling gold that the best judges find it difficult to detect the difference, except by a chemical test, and it has the virtues requisite to make it the best substitute for gold known. GENUINE AMERICAN MOVEMENT. EXPANSION BALANCE. BEAUTIFULLY ENGRAVED OR ENGINE TURNED HUNTING CASES, and equal in appearance to a COLD WATCH THAT COSTS FROM \$150 TO \$200. It sells and trades readily, for from \$50 to \$100, and if you wish a watch for your own use or to make money on, try this. Owing to our large sales, we are enabled to reduce the price of them to \$12 each with an elegant Chain attached. They are used on Railroads, Steamers, and in Manufactories, and other places where accurate time is required, and gives general satisfaction. We send them by Mail or Express, on receipt of \$12, to any part of the Country, or it will be sent C.O.D. when the customer desires and remits \$12 on account. These Elegant CHAINS weigh about Fifty Pennyweights, and the same pattern in pure gold would cost \$100. We sell these Chains at \$3 each. But we sell the Watch and Chain for \$12, sent by Mail in a Registered Package, post-paid, to any Post Office in the United States.

TO WATCH SPECULATORS

WE SELL THE WATCH WITHOUT THE CHAIN FOR \$10.

# ANOTHER GRAND VICTORY

—FOR THE—

## AVERILL MIXED PAINT.

At a meeting of the Board of Managers of the Twelfth Industrial Exhibition of the Mechanics' Institute, held November 20th, the First Premium and Medal was awarded to the

### AVERILL MIXED PAINT,

Over all competitors, after the most careful examination, and thorough tests to which the article of Paint could possibly be subjected. The Committee selected by the Board of Managers to examine, and test the merits of the different Paints in competition, consisted of Professors Hilgard and Rising, of the State University, W. B. Ewer, of the firm of Dewey & Co., proprietors of the *Mining and Scientific Press*, and the *Pacific Rural Press*, Mr. Hopps, of Hopps & Sons, and Mr. Frost, of Frost & Richards, two leading firms of practical painters of this City. Probably there could not have been found in the State of California, five men possessing greater scientific and practical ability, for testing and intelligently deciding, the merits of the article of Paints, than the gentlemen above named; and the thoroughness with which they conducted their test, proved that they fully appreciated the importance to the public, of KNOWING POSITIVELY, which of the many Paints offered for sale was ACTUALLY THE BEST.

Work was done under the supervision of the committee with each of the competing paints to test the working and covering qualities. Samples of each were subjected to chemical analysis by Professors Hilgard and Rising of the University, and it was found that the "Averill Paint" was composed of STRICTLY PURE WHITE LEAD, ZINC AND LINSEED OIL, and that these ingredients were united and held in solution by the addition of SILICATE OF SODA or "SOLUBLE GLASS," the value of which last named ingredient the committee takes special pains to notice and commend. Houses that had been painted with the Averill Paint for from one to seven years were

examined, and they report that the paint was found solid, with a rich glossy finish and no signs of chalking or peeling off.

The competing Paints had no work to show for an equal length of time, they being comparatively new and untried, but such as they had was examined, and the report shows that each of them was found lacking in some necessary merit. While the Averill alone, starting from the analysis of its ingredients and the application of the fresh paint, to the examination of different houses where it had been on for from one to seven years, stood all the tests and was

awarded the first and only PREMIUM AND MEDAL.

The award from such a Committee, after such tests, requires no further words, and we submit it to those intending to paint, with the assurance that they will find the Averill Paint possesses all the merits claimed, and as a house paint has no equal. It is composed of strictly pure White Lead, Zinc and pure Linseed Oil, to which is added Soluble Glass, which unites and holds it in solution. It is mixed ready for the brush, and any one can apply it. It is of pure white, and all shades and colors. It produces a brilliant finish and will last much longer than any other Paint. Our Wagon and

Machinery Paints, from the finest Vermillion to the more common and cheaper colors, are specially fine, and being ready mixed, meet the wants of the public completely.

Our Metallic Roof Paint, made of Oxide of Iron, comes the nearest to being actually Fire Proof, and is certainly the best and cheapest Roof Paint ever made. The Averill Paint is put up in  $\frac{1}{4}$ ,  $\frac{1}{2}$ , 1 and 5 gallon cans, and in barrels, and sold by the gallon. Ask your dealer for it and take no other. If he has not got it, send direct to us for Sample card of colors and Price list.

Manufactured and Sold by the CALIFORNIA PAINT COMPANY, 27 Stevenson Street, San Francisco.

### Amusements.

#### GRAND OPERA HOUSE.

Mission Street.....Between Third and Fourth.

M. A. KENNEDY, Acting Manager.

Open every evening with a first-class dramatic company. Box office open from 9 A. M. to 10 P. M. Doors open at half past seven. Commence at eight.

#### CALIFORNIA THEATER.

JOHN McCULLOUGH.....Proprietor and Manager.  
BARTON HILL.....Acting Manager.

Bush Street, above Kearny. Open every evening with the best dramatic company in the United States. Box office open from 9 A. M. to 10 P. M. Seats may be secured six days in advance.

#### BUSH STREET THEATER.

CHAS. E. LOCKE.....Lessee and Manager  
FRANK LAWLER.....Acting Manager

Open every evening and Saturday matinee.

#### KIRALFY'S COMBINATION.

Introducing the grand ballet. Seats may be secured six days in advance.

#### BALDWIN'S THEATER.

THOMAS MAGUIRE.....Manager.

Corner Market and Powell Streets. Open every evening and Saturday matinee. Union Square theater company. Magnificent scenery; elegant appointments. Box office open daily.

#### Copp's Hand-Book of Mining Laws.

Henry N. Copp's hand-book of mining laws, just issued, contains the United States mining laws and instructions thereunder, a digest of decisions, forms, list of mining patents issued, etc. The digest of decisions alone is a very valuable thing, giving, as it does, in brief form, all the decisions of the Secretary of the Interior and Commissioner of the General Land Office in relation to mining matters. These are all under proper headings for easy reference. Forms are given for notice of location, proof of labor, notice of forfeiture, miners' lien, application for survey, patent, etc., affidavit of improvements, etc. There is also a list of patents issued for mining claims from July 26th, 1866, to August 1st, 1877. The book is of pocket size and very convenient for all who are interested in mines. It will be sent post-paid for \$1, on application to Dewey & Co., 202 Sansome Street, San Francisco.

FOR GOOD LIVING go to Webster's Palace Restaurant, 218 Sansome Street, S. F. Best of dinners only 50 cents, from 5 to 8 P. M.

## Stockholders and Mining Stocks.

The Governor of this State, in his message to the Legislature, has the following to say on this important subject: "There should be legislation to better protect the stockholders in mines from the mismanagement and rascality of the Directors. Mining is a legitimate business, is one of the largest interests of the State and is carried on now mainly through the agency of corporations. Those who invest their capital in mining stock for the purpose of developing and working mines are entitled to have the mines honestly worked and to reap the legitimate fruits of such investment of their capital. The laws should compel Directors to operate mines in the interest of all stockholders and not in the interest of an 'inside ring'."

"I venture to suggest, also, that the purchase and sale of mining stocks should be made a source of revenue to the State. The purchase and sale of mining stocks may be as legitimate business transactions as any other transactions which take place in the business community. When the purchases are made for the purpose of investment and with the expectation of receiving a return on the investment from the yield of the mines, they are of that character. But the great bulk of the transactions in mining stocks is quite independent of the character of the mines or of any expectations of a return on the capital invested from the yield of the mines. They are transactions wholly for purposes of speculation and are totally disconnected with the mining industry of the country. Without assuming to deny that these transactions have been productive of some good to the community, it is safe to assert, on the other hand, that no other occupation, not even that of gambling, has been productive of such terrible and widespread evils. A tax on the sales of mining stocks would be a legitimate source of public revenue and its imposition might be productive also of incidental benefits."

The Governor is perfectly right in his assertions, especially with reference to the speculative purchase of mining stocks made by persons having no interest whatever in the mines represented by said stock. As he states, the great bulk of transactions is made on this basis, and this is the greatest evil of the business, from which all the others spring. Such transactions are entirely outside the bounds of anything connected with the mining industry. As originally intended, the system of companies and shares was simple, so that each one should bear the expenses and reap the profits of mining ventures in the proportion of his interest. Unfortunately, this system, excellent in its intention, has become perverted so far that the original idea has been almost entirely lost sight of. Any one at all familiar with the subject knows that not one in a dozen of the dealers cares anything about the mines themselves aside from the value they give to the stock. They do not care whether mining is carried on legitimately or not so long as shares can be made to fluctuate.

That legislation is needed to protect stockholders in mining companies from the rascality of those in office, and who have supreme control of affairs, is perfectly apparent. The question is, how to legislate to get rid of the evils at present existing. A great difficulty is that most of those holding stocks know very little about mining, and they leave the management entirely to the Directors, who are not, unfortunately, always honest men.

One way to remedy some of the evils incident to the dishonest Director part of the business, would be to compel the Secretary of the company to keep a full and complete record of the business meetings of Directors, and that book should be accessible to any man holding a single share of stock in the company. The records of the meetings, or certified copies of such, should be placed in the office, where they could be examined any day. Make the laws stringent enough, so that on the discovery of any fraudulent entry, the Secretary and the one authorizing the change could be severely punished both by fine and imprisonment.

Then, again, an abstract from the books of the company could be made at least once a month, and oftener if necessary, and this should be

posted in the office so as to be accessible to any one, whether an owner of stock or one intending to purchase. This would have the effect of weeding out a good many "wild-cat" companies if the rule were rigidly enforced, and any infringement or falsification punished to the limit of the law. It would also prevent a great deal of swindling, for the misrepresentation of one man could scarcely get money out of others; it would require all the officers to be in collusion to deceive persons who desire to buy stock. There is no reason why one should not know the status of a mine as he does that of a piece of property when he is going to buy it.

An enforcement of regulations such as these, although they might give a little mine trouble to the officers, would do much to protect the stockholders who invest their money where half a dozen men have supreme control of it, as in the case of Directors of mining companies. A thorough discussion of this subject will no doubt bring out many suggestions which would be beneficial to all concerned except those who are wrongfully making money under the present system.

## The Codling Moth.

As this pest is making California fruit growers conscious of its presence, we have secured an engraving from the drawings of Prof. C. V. Riley, in order that all may become familiar with the appearance of the insect in its different stages, and recognize it. We also copy from Prof. Riley's reports some descriptive notes.

The following figures represent the apple worm (*Carpocapsa pomonella*) in all its states, and gives at a glance its natural history: *a* represents a section of an apple which has been attacked by the worm, showing the burrowings

Transformations of the Codling Moth.

and channel of exit to the left; *b*, the point at which the egg was laid and at which the young worm entered; *c*, the full grown worm; *d*, its head and first segment magnified; *e*, the cocoon which it spins; *f*, the chrysalis to which it changes; *g*, the moth which escapes from the chrysalis. The worm of the codling moth, when young, is whitish, with usually an entire black head shielded on the top of the first segment. When full grown it acquires a flesh-colored or pinkish tint, especially on the back, and the head and top of first segment become more brown, being usually marked as at *h*. It is sparsely covered with very minute hairs which take their rise from minute elevated points, of which there are eight on each segment. The cocoon is invariably of a pure white color on the inside, but is disguised on the outside by being covered with minute fragments of whatever substance the worm happens to spin to. The chrysalis is yellowish brown, with rows of minute teeth on its back, by the aid of which it is enabled to partly push itself out of its cocoon, when its time to issue as a moth arrives. The moth is a most beautiful object. Its fore wings are marked with alternate, irregular transverse wavy streaks of ash-gray and brown, and have on the inner hind angle a large tawny brown spot, with streaks of bright bronze color or gold.

A FAIR in Boston, this week, in aid of the old South church, realized \$36,000.

## Improved Weighing Scoop.

Michael L. Mery of Chico, California, has patented, through Dewey & Co.'s Patent Agency a novel combination scoop and weighing device, which we illustrate on this page. It consists in constructing a scoop or combination with a spring balance located in the scoop handle with scale and pointers on the handle, and a stop so arranged as to save the spiral balance spring from damage when the scoop is thrust into any hard, unyielding material.

The scoop, *A*, has its movable stem, *B*, sliding on the handle, *C*, and outside the spring case, *H*, as shown. The guides on rollers, *D*, serve to keep the stem in position, so that the spring may work free; also to prevent friction

Mery's Improved Weighing Scoop.

while weighing. A similar set of anti-friction rollers, *D*, are fixed to the lower end of the stem, so as to work between the outer and inner case *U* and *H*. A spring stop, *L*, is so arranged on the handle as to be directly under the thumb when the handle is grasped, and a slight pressure of the thumb on it when the scoop is thrust in the material, prevents the stem, *B*, from being pressed back. A spiral balance spring, *G*, plays within a socket or case, *H*, which fits inside the stem, *B*, and is made fast to the inside lower end of the handle.

A thimble, *I*, placed in the lower end of the socket, *H*, holds the end of the spring, and a nut and screw, *J*, in the end of the handle, operates upon this thimble and serves to adjust the tension of the spring. This screw, *J*, can be made hook-shaped and can be used to hang the scoop by when not in use.

A scale, *K*, is fixed on the handle and is graduated on both sides by a double pointer, *L*, one

side to ounces and the other to quarter pounds or any desired scale.

When the scoop is in use the handle is naturally grasped so that the thumb is directly over the stop, *L*, and a slight pressure on it when the scoop is thrust into any material prevents the stem from being pushed down upon the spring, and causing any damage to it. The combination of handle and stem is made stiff and unyielding by reason of the stop, thus facilitating the scooping up of any hard, unyielding material.

When the material to be weighed is raised up in the scoop, the stop is released and the balance, being free to act, the weight of the material will show on the scale. This arrangement of scoop and scale gives two useful articles in one, and is very serviceable where a large amount of material has to be divided by weight into small quantities. For further particulars, with regard to procuring rights or manufacturing, address M. L. Mery, Chico, Butte county, California.

## Gould & Curry.

The annual meeting of the Gould & Curry mining company was held on Tuesday. The Superintendent's annual report was read and received. From this it appears that during the past year an aggregate of 2,288 feet of drifts have been run on the 1,500, 1,700, 1,800 and 1,900 foot levels. On the last level a lateral drift has been run the whole length of the mine to the Savage joint winze, to give free circulation of air in the mine. A large amount of money has been expended in removing the old pumps and machinery and replacing them with new and more powerful appliances. New tanks have been put in, and all this work is completed and paid for. The mine has now one of the best pumping engines, with a line of 14-inch pumps, on the Comstock, and at present it is run at only one-third of its capacity. New boilers, etc., have also been built. Although no ore has been found on the lowest prospected level (the 1,700-foot), the crosscuts have been through favorable ground, and the Superintendent expresses the opinion that good ore will be found on the 1,900-foot level, the formation being such as is found in the vicinity of ore on the Comstock.

From the Secretary's report it appears that the receipts from assessments amount to \$429,763.82, and from other sources \$26,574.45; a total of \$456,338.17. The disbursements, including an old debt of \$108,603.45, amount to \$472,196.63, leaving the company \$15,853.46 in debt at the present time. The value of property owned by the company is stated at \$394,533. The reports were adopted and the following Trustees elected for the ensuing year: Charles H. Fish, George Congdon, Geo. R. Wells, Solomon Heydenfeldt, Robert Sherwood, R. R. Folis and W. S. Lyle.

Mr. Wells was elected in place of J. G. Fair, and Mr. Heydenfeldt to fill the vacancy caused by the resignation of Mr. Flood. Otherwise, there is no change in the Board. Mr. Fish was elected President; Mr. Congdon, Vice-President; Alfred K. Durhrow, Secretary, and F. F. Osbiston, Superintendent. It was voted to levy an assessment of \$1 per share on the capital stock, in order to pay off the indebtedness of the mine and prosecute the work of development.

NEW PATENT AMENDMENT.—The following is the full text of the bill introduced in the Senate by Barnum, to save the rights of patentees under Section 4,915 of the Revised Statutes: It provides that, "No patent which has been heretofore amended by introducing new matter into the specification and reissue under Section 53, Class 230, Statutes at Large, or under Section 4,916 of the Revised Statutes, shall hereafter be declared invalid by the United States, for the reason that a commissioner of patents was not authorized by said sections of said Statutes, in case of any patent of which there were neither model nor drawing, to admit proof that the new matter of the amendment was part of the original invention and was omitted from the specification by inadvertence, accident or mistake." Referred to the Committee on Patents of which Booth is Chairman.

## CORRESPONDENCE.

It is the desire of the editors of this journal to be liberal toward all correspondents, and therefore statements and opinions are frequently published, on the authority of the writers, for which we do not assume responsibility.

### El Dorado County Mines.

A More Prosperous Mining Era about to Open in this Region.

EDITORS PRESS:—In my last I related how almost wholly the business of gold mining had ceased in and around Coloma—how the thunderous roar of this industry, sweeping away to other localities, is heard but faintly now in the place of its nativity. Here and there some squads of Chinese are still to be seen, scavenger-like, rewashing the tailings, already often washed over, or patiently pushing their wing-dams out into the river, rescuing a portion of its bed for mining purposes, the indefatigable and ever present Mongol confining his labors mostly to this class of operations. The number of whites mining about Coloma is, however, small, and every year decreasing. But while gold mining has become so almost extinct in the neighborhood of this ever memorable locality, it is being actively and successfully carried on in other portions of the county, a gradual but very general revival of this industry having taken place in El Dorado county during the past year or two, a result due mainly to the several large canals that have here been in progress of construction, and some of which have only quite recently been completed.

This county is by no means deficient in mineral wealth, its resources in this direction being varied and abundant. It contains a great number of quartz lodes of good character, while in the matter of auriferous gravel banks and deep lying channels it is second only to Placer and Nevada. What has tended to depress placer operations heretofore has been the limited supply of water that, until lately, has been furnished to the mines, a difficulty that will now be wholly and permanently overcome through the final completion of the works above referred to.

Among these enterprises that of The El Dorado Water and Deep Gravel Mining Company

May justly be accounted the most extensive and important. This company was organized about four years ago, with a view to introducing into the gravel mines and upon the farming lands about and below Placerville a more abundant supply of water than they had before enjoyed, to which end this company bought out the water franchise, ditches and mining grounds of the old South Fork canal company, and also the rights and properties of several smaller companies, securing to them ditches aggregating nearly 150 miles in length, and in the construction of which about \$1,000,000 had been expended. The South Fork canal carried only 1,000 inches of water, and this was delivered on a level too low to allow of its being used in some of the best mining localities along the route, or to admit of its effective employment anywhere in hydraulic washing.

The company afterward, through purchase and location, added largely to their possessions, acquiring ownership to some 20 lakes situate near the summit of the Sierra Nevada, together with many eligible reservoir sites, nearly all of which have since been wholly or partially utilized. The water shed tributary to these lakes, the largest of which are the Glacier, Medley, Echo, Audrain, Twin and Silver, covers an area of 500 square miles, the primary sources of water supply consisting mainly of the higher peaks and slopes of the Sierra. By damming up their outlets the retaining capacity of these lakes could, at small cost, be more than doubled. In some cases these obstructing works and reservoirs have already been built. The construction of

#### Their Main Canal

Was commenced in the spring of 1874 and pushed with such energy that it was brought to completion in the fall of 1875, notwithstanding the obstacles encountered in its progress were manifold and formidable. The working force employed during this period varied from 1,000 to 1,200. This main trunk, which is 32 miles long, takes the water from the South fork of the American river at its confluence with Alpine creek and carries it thence to Sportsmen's Hall, 10 miles above Placerville, where it is turned into the various distributing ditches that conduct it to the mining localities where required for use. This trunk, which is five feet wide at the bottom, 13 on top and six feet deep, has capacity to carry 5,000 inches of water, and cost something over half a million dollars. There are along its line over three miles of fluming, with numerous deep cuts and tunnels through the solid rock, and massive supporting walls at some points over 60 feet high. The company have built 144 miles of distributing ditches, excavated altogether 200,000 cubic yards of rock and used over a million and a quarter feet of lumber, the total expenditure in the improvement of their property, outfitting of their expensive mining claims included, having approximated a million dollars. During the past two years they have made many additional

improvements, such as enlarging and increasing subsidiary ditches, constructing more reservoirs, introducing new hydraulic apparatus, opening claims, etc., a labor force of about 200 men having been employed mostly in work of this kind. They have also run a tunnel of 1,000 feet long through one of the high ridges of the Sierra to reach Echo lake and bring its water through on the western side of the mountain, their receptacle for water catchment covering altogether an area of 13,000 acres to a depth of 20 feet.

#### Their Future Plans

Embrace the building of a V flume from the lower end of their main ditch to Placerville or further on to the terminus of the railroad, should the track not be extended to Placerville, as is now expected, it will be in the course of another year. This flume will reach into the heart of a fine timber region, enabling the company to profitably supply lumber to the markets below at a reduced cost. After using what water they require upon their own claims they will have a considerable surplus which will be sold to other miners. They will also supply water for irrigating purposes, the most of it being such as have already been used for hydraulic washing, and can, therefore, be afforded at very low rates.

They have it in contemplation to run a tunnel through Spanish hill to serve as outlet for a tract of rich gravel owned by them at that point; also, the further damming of their lakes and the enlargement of reservoirs, not to mention divers other schemes of a practical and highly useful kind.

#### The Mines of this Company

Consist of the Excelsior tract, embracing 75 acres, on Coon hill, near Placerville; the White Rock, containing 100, and the Spanish Hill, containing 200 acres, besides various smaller claims, the whole aggregating 725 acres, all first-class gravel land. On some of these claims, which are well outfitted, washing has been in progress for the past two years with excellent results, the average earnings having been at the rate of 16 cents for every inch of water used. Being in better shape now than ever before, the net profits realized from these mines will increase rapidly hereafter.

The success of this great enterprise, in the face of so many natural obstacles, has been largely due to the efforts of Prof. Thomas Price and his associate, Luis A. Garnett, President and organizer of the company, both of whom, in the capacities of consulting engineers and financial agents, have rendered the company most valuable service. Prof. Price has been especially active in promoting this project, having great confidence in the ultimate results that would attend it. When others, appalled by the difficulties that presented themselves, faltered and were nearly ready to give up, this gentleman, impressed with the importance of the ends proposed to be reached, the feasibility of the scheme and the great future that awaited its completion, exerted himself successfully to keep the work in progress and finally engineered it to a fortunate termination.

While the ditch above described delivers most of the water used on the Placerville divide, there are

#### Several Smaller Works of this Kind

That contribute materially towards that end, the largest of these being what is known as the Eureka ditch, capable of carrying about 2,000 inches of water, the most of it taken from the North fork of the Cosumnes and delivered in the mining camps along the southerly and westerly borders of the county. Much of this water is also used for irrigating purposes. It is a valuable and productive property, provided with reservoirs, sub-ditches, etc. Altogether there are about 50 different ditches in the county. They have a total linear extent of nearly 1,000 miles, carry in the wet season something like 12,000 inches of water and must have cost originally not less than four or five million dollars.

On this, known as the Georgetown divide, the main source of water supply is

The Canal of the California Water Company;

An extensive and costly work, commenced in 1872, and still unfinished in some of its details, though the principal ditch has for several years been completed. This is a San Francisco company, incorporated with a capital of \$500,000, and embraces among its larger shareholders some of the most enterprising and sterling business men of the metropolis, James P. Pierce, the great Smartsville gravel miner, being President of the company. Their properties consist of water franchises, ditches, mining, agricultural and timber lands, sawmills, etc.; all these different branches of business being actively prosecuted by the company. The most of their water is obtained from a system of lakes of glacial origin, stretching along a basin-like depression called the Valley of the Rubicon—being the South fork of the Middle fork of the American river, and situated at a great altitude on the westerly declivity of the Sierra Nevada. Tributary to this basin is the Little South fork, also glaciated and full of small lakes. The most of these lakes are very deep, some being also quite large, the catchment capacity of all being susceptible of great enlargement by means of damming up their outlets. This water is brought upon the mines and agricultural lands, which cover the entire divide, by means of a system of ditches having an aggregate length of over 300 miles, and capacity to deliver about 16,000 miners' inches of water. This company, in addition to its purchase price, have expended some \$400,000 in the improve-

ment of their property, which is one of the most valuable and carefully managed of any in the State, notwithstanding it has failed to return the profits counted upon at the outset. When this enterprise was inaugurated great calculations were made upon the "seam mines," a marked feature of the auriferous deposits on this ridge and which, at that time, were attracting much attention, it being generally believed that they would prove very remunerative. Being somewhat disappointed in this source of revenue the income of the company has been temporarily curtailed. But this has caused them no special embarrassment, having had the effect to merely postpone the great success that in a year or two may be expected to richly reward their well-directed endeavors. Their water franchise is one of exceeding value, and, like the most of these properties in California, must appreciate steadily in the future. If labor is to be king on this coast water will be its prime minister. Even the precious metals will have to accept positions subordinate to this element in the coming empire of industry. Wise above all others are the men who secure the water, for this must become very soon the key to wealth and power. Even though these properties yield but small earnings at first they will pay a larger percentage than any other class of investments in the end.

### Trees and Rainfall.

No. 5

(Written for the Press by SAMUEL PURNELL.)

#### Consumption of Grass by Sheep.

Undoubtedly one of the leading causes of the increasing dryness of southern California is the almost complete destruction of the grass by sheep. Wherever a herd of sheep grazes, the grass is entirely consumed, as though a fire had swept over it and with the same results; it grows green no more that season. The grass upon the mountains of central and southern California has been thus destroyed. Often the very roots are killed and the soil in many places has become barren. The islands off the coast have been converted into sheep pastures, and the grass upon them, except during the period of winter rains, has disappeared and the desert cactus alone flourishes. Even in the high Sierras, where, as the summer draws on, they are driven from the exhausted hills below to escape starvation, almost everything green within their reach is devoured. They destroy the plants and undergrowth upon which insects depend, so that even the birds have now disappeared from the sheep-grazing mountains.

In the midst of this desolation and increasing dryness a few individuals prosper by raising sheep, but the halaucc of the people are sorely suffering thereby and their posterity will be extinguished. Sheep raising upon a large scale, where 6,000,000 of sheep filch their living from the public mountains, as is the case in California, should not be tolerated by a wise people. The safety of the public should be the supreme law. Mountains cannot become newly wooded; no young trees can grow as long as trespassing sheep are permitted to eat them. Sheep should only be allowed when the owner keeps them in inclosed fields and raises the grass for their subsistence. As long as public sentiment tolerates the present gross violation of its vital interests, so long will selfish persons keep the mountains stripped of every green thing, and the dryness will increase and the rains grow less and the sands of the desert spread still further, till neither men nor sheep can survive. Scarcely one person in a hundred in this State is interested in sheep or wool; the many suffer for the benefit of the few, the productivity of the country is arrested and its climate and soil undergo a change from fertility to desolation. In view of this it is within the bounds of moderation to assert that the presence of sheep in large numbers, as they are kept in California, is actually a curse to the country.

No one can say with certainty that the

#### Great Valleys of Central California

Have been covered with forests within the historic period, but it seems probable that they have not been wooded for at least several hundred years. If we may rely upon evidence that is somewhat unsatisfactory, we may affirm that surely within the present geological epoch, and within the historic period and since the discovery of America, the great valleys, as well as the Coast Range, have teemed with forests. How these trees were destroyed we may never know, but, as there is no reason to believe that they were destroyed by cosmic causes, we may assume that the California valleys and coast forests were, as has universally been the case elsewhere, sacrificed upon the altar of man's hate, greed and ignorance; or, at least, that man began the work and outraged nature finished it. When these valleys were wooded, and the Coast Range upheared its evergreen forests, summer showers were frequent, the streams ran high in their banks, and the green grass waved all summer in the cool and moist breezes. Now, except on the northern part of the Coast Range, we find no forests till we come to the Sierras; these to a height of some 8,000 feet are in most places well covered with groves of manzanita, oak, nut-pine and coniferous trees, and much rain falls upon them in winter, sometimes a very little in summer. If trees produce rain, it may be asked why the high and well wooded Sierras do not enjoy

abundant summer rains. It may be doubted that the

#### Influence of the Northwest Trade

Extends to the summits of the central Sierras; the cool wind that blows across the Coast Range is never felt upon the high Sierras. The trade wind blowing over the treeless and hot soil of the Coast Range and encountering the furnace heat of the great valleys—lacking only sand to constitute them true deserts in summer—is elevated to so high a temperature, and ascends to so high an altitude, that it either blows over the summits of the Sierras, or its force becomes spent and the wind becomes lost in the upper air. Thus, by reason of the barren Coast Range and hot valleys, the trade wind can produce but little summer rain in the Sierras, and the forests of those mountains are chiefly useful to increase the quantity of winter rain. To secure summer rains upon the valleys and the coast, the trade wind should be cooled below its dew point immediately upon its striking the coast and while it passes over the Coast Range, then it would deposit a large share of its moisture—perhaps a third—upon the coast and the interior valleys. There is only one way to accomplish this, and that is to cool the soil and wind by means of forests. There are other reasons, beyond mere refrigeration, why trees produce rain, which will be noticed hereafter. In the

#### Northern Part of California,

Where the interlocking spurs of the Coast Range and the Sierra Nevada cover that portion of the State and give it a broken and rugged character, there are some extensive growths of redwood trees, but these forests are neither of the right kind of timber nor of sufficient size to precipitate the summer rains. Their best use is to cause a copious rainfall in winter, and that section, because of its trees, receives a rainfall two and three times greater than that of the vicinity of San Francisco.

Thus far in our remarks, little has been said upon what is termed

#### "The Crime Against Posterity."

This crime, unpardonable and unforgivable and which can only be expiated, consists in the wanton destruction of the forests which nature has planted and nourished and without which man can neither enjoy lasting health nor wealth nor transmit to his posterity an inhabitable country. It consists also in the neglect to plant trees to replace those destroyed by the actual necessities of civilization, thus entailing upon his posterity an inheritance of desolation. To an individual actuated by mere selfishness, it is not conceivable how man is subject to obligations outside of his personal pleasures and necessities and impelled by a sense of duty to leave things better than he found them. With the right thinking man there can be no question of his duty to those who are to follow him; he feels that it is not only his duty to transmit the productivity of a country in as advanced a state for the sustenance of life and the health and development of the human race as he found it upon his terrestrial abode, but he realizes that he has a duty to endeavor to transmit to posterity a better and more perfect inheritance of health, wealth and development than he himself received. If one feels that he has no duty to perform to society, has no enthusiasm to reform abuses, burns with no desire to improve the existing order of affairs, is conscious of no obligations to posterity, such person is deficient in the moral qualities, is no better than a savage and the world is poorer for his having lived. Man is improved in his condition and rises in the scale of progress and noble development mainly by the pains and labors and sufferings of his predecessors. A single generation makes no sensible advance. We are the posterity of our forefathers. Almost all we enjoy we owe to their toil and aspirations, and one who shrinks from performing his duty to his successors, making the selfish plea that he owes nothing to posterity as posterity did nothing for him, is unworthy of the age in which he lives, is an ignorant and selfish savage and will receive the reward of his evil nature in corporeal and spiritual annihilation. Aside from this, no man in the pursuit of selfish and temporary purposes has any natural right to destroy a forest, to lessen by a single acre the amount of rain-producing substance and thereby destroy the fertility of a district. Society at large and posterity have an interest in the perpetuity of the forest greater than any government or any one called "owner" or any mere set of men can possibly have. At present the owner, so-called, of woodland may, of his own volition, for pleasure or malice, slay a forest which took a century to grow and is the rain producer of a fertile and prosperous valley. The small amount of money realized does no good to society, while that valley, with its thousand homes, becomes dry, a sandy desert and its people disappear. Would any one possessing the instincts of justice for a moment admit the natural right of the proprietor of that forest to produce this scene of desolation in pursuance of his private purposes, merely because man-made laws declare him "owner" and that he can do as he likes with his own? A distinction between the use and abuse of the rights of property should in such a case be sharply drawn; no one should in any case be permitted by law to so treat what he calls his own as to damage his neighbors or to infringe upon the clear right of posterity to receive the natural wealth of soil, forests and rainfall, unimpaired by its ancestry. Man has but a limited and temporary use of natural wealth and

(Continued on page 390.)

## MECHANICAL PROGRESS.

## Progress in Flour Milling.

A writer in the *Mill Stone* recounts in an interesting manner the many ways in which the modern art of flour making shows progress over that practiced a generation ago, but which is still in vogue in some mills. We extract a few points which are interesting and suggestive: The new process means a first-class steam engine, grinding the flour and heating the mill on a cent's worth of coal to the bushel of wheat. Where water power is used instead of steam, the new process means the use of turbine wheels, giving over 80% of the full power of the water, instead of the old breast-wheel giving only 50%.

The new process means nicely turned iron shafting and pulleys, with belt-gearing, in place of wooden shafts and cog-gearing with two or three old millwrights slashing around with sledge hammers to keep them wedged, and assisted occasionally by two or three millers making frantic efforts to start the break-downs. It also means closely jointed old stock burs, and plenty of them—36 inches in diameter for middlings, and from 42 to 48 inches for wheat, according to the hardness or softness of the wheat—all in perfect balance and true smooth face, and the lands thereof to be from one-third to one-fourth of the whole surface of the burs, instead of one-half as in by-gone time. It does not, however, mean any particular patent dress, the common equalizing dress is good enough; but it does mean that the furrows shall be smooth and straight in all directions, not less than two inches broad and deep enough at the eye to bury the largest grain of wheat, and about the fourth of that of the skirt, the draft of the feather edge to be one inch to the foot in diameter of the bur, and all furrows of the same kind to bear the same relation to the center and circumference, and also that the miller shall have the power and means to alter the speed of any run without affecting the remainder, *i. e.*, speed to be altered instead of draft.

To mill under the new process means that the chop shall roll instead of slide between the burs, or, in other words, the substitution of a system of granulation in place of grinding.

The old process or system that required a man to jump on the burs every 24 or 36 hours and slash them all over with a pick so as to make them cut 15 bushels of wheat an hour, and make 24 bushels of flour to the 100 bushels of wheat, is fast becoming obsolete.

Instead of this old-time system it is now required of the miller that the face of the burs shall be smooth and true, and if any high places develop themselves they must be gently touched by the hand of a master either with pick, diamond or emery wheel, and not more than six bushels an hour should be ground on a pair of burs, and this should be ground cool or not at all. Moreover, it should be ground high enough to take off a broad, clean hran, and to make one-half middlings, and finally, last, though not least, the substitution of the new process, as herein delineated in outline, means to realize 20% per bushel more out of the wheat than by the old style, and a showing of a good and satisfactory balance on the right side of the ledger at the end of the year.

## A Locomotive Set up in Three Hours.

The days of deliberate and long considered labor are departing and the substitute is work at lightning speed. The most remarkable feat on record in connection with locomotive building has been performed at the shops of the Michigan Central railroad at Jackson, Mich., where, it is alleged, two new engines were completely put together and set in motion in a few minutes less than three hours from the moment the naked boilers were hauled into the shop.

Thursday evening, November 15th, there stood in the Michigan Central yard at Jackson two locomotive boilers, complete in all respects, upon trucks, while within the shops were the levers, the valves, the cylinders, the connecting rods, the bolts, the nuts, the wheels, the frames and all the other pieces of machinery required to construct two perfect locomotives, all finished and ready for use, but not one of which had ever been fitted to its neighbor or subjected to any test or measurement other than those applied to every similar piece before being pronounced good and fit for service. A notice was given that these parts were going to be combined in two harmonious wholes, and that those persons who desired to see a locomotive put together in the shortest possible time were invited to be present on Friday morning.

At seven o'clock to the minute the shop doors were opened, the boilers hauled in and the two gangs of 14 men each sprang to their work. The spectators, numbering about 200 men, stood far enough away not to interfere with the workers, and the contest went on.

The jacks were applied, the huge boilers were raised and bolted on their frames, then they were placed on their wheels with all possible expedition, while simultaneously work was progressing on every portion of the machines, which were rapidly assuming perfect form. Water was let into the boilers, and even while the men were working at the grates the fires were kindled and the "infants" began to warm up for their work. All this time not an

unnecessary word was spoken and every man worked as though his very existence hung upon the uninterrupted prosecution and speedy completion of his task. Great drops of sweat gathered on their heated faces and trickled down in streams; but no thought of rest suggested itself to a man, and a feeling of anxious pride pervaded all alike, workmen, shopmates, officers and spectators. At last one of them is ready for the smoke-stack, and is pulled along the track until she stops beneath the one designed for her, which hangs above her. A few moments more and the last screw is turned, the last bolt is fastened, the engineer stands in his place, and in just two hours and fifty-five minutes from the time the signal to commence was given, the throttle is pulled and the first of the twins moves off completed, followed a moment later by her mate, amid the cheers of all who have been fortunate enough to witness the most wonderful feat ever known in the history of locomotive building.

In considering this extraordinary achievement, must not be forgotten that the most wonderful feature of the whole, is that no mistake of any kind was made, and that every portion was so perfect that there was not the delay of a second in fitting or adjusting.

We read also that at the Pennsylvania railroad shops, upper and lower, at Altoona employ 3,000 hands. With the facilities at hand an eight-wheeled hopper-bottom car can be constructed in an hour, and recently 112 of this class were turned out in a week of ten hours a day. An eight-wheeled box-car can be made in nine hours, including one coat of paint, and a passenger car can be built two days.

**WHAT A BOY DID FOR THE STEAM ENGINE.**—In his article in the *Popular Science Monthly*, on the growth of the steam engine, Prof. Thurston says that when the engine had assumed a form that somewhat resembles the modern machine, an important defect still existed in the necessity of keeping an attendant by the engine to open and shut the cocks. A bright boy, however, Humpfrey Potter, to whom was assigned this duty on a Newcomen engine in 1713, contrived what he called a *scoggon*—a catch rigged with a cord from the beam overhead—which performed the work for him. The boy, thus making the operation of the valve-gear automatic, increased the speed of the engine to 15 or 16 strokes a minute, and gave it a regularity and certainty of action that could only be obtained by such an adjustment of its valves. This ingenious young mechanic afterwards became a skillful workman, and an excellent engineer, and went abroad on the continent, where he erected several fine engines. Potter's rude valve-gear was soon improved by Henry Beighton, and the new device was applied to an engine which that talented engineer erected at Newcastle-on-Tyne in 1718, in which engine he substituted substantial materials for Potter's unmechanical arrangement of cords.

**A GAS GOVERNOR.**—*Iron* says: The constant variation in the pressure of gas acts prejudicially in several ways; in addition to the trouble of having frequently to regulate the flame at the burners, a large amount of gas passes through them unconsumed, whereby the quality or illuminating power of the light is impaired, and the atmosphere of the room made unhealthy, besides causing the meter to work irregularly. A simple governor, called the Imperial Regulator, which may be screwed on to any meter, has been especially designed to equalize the flow of gas, and so put an end to the above named difficulties. It governs the pressure of the gas so perfectly, that the cocks of the burners may be turned full on when the gas is lighted, not requiring any subsequent adjustment; and whether one light or 50 be in use, a quiet, steady light with full even flame is maintained, while a saving of from 15% to 20% is effected.

**COOLING WATER.**—A description of a simple contrivance for the rapid cooling of liquids, invented by M. Toselli, is described in *Les Mondes*. It consists of a cylindrical cup for holding any liquid into which may be plunged an inner goblet, shaped like an inverted truncated cone, and having a lid which rests on the outer cup. Putting 150 grammes of nitrate of ammonia in the inner goblet, filling it with cold water, and stirring it so as to hasten the solution, the temperature of the outer liquid is soon reduced at least 12° C.—22° Fahr. The salt may be used for an indefinite period, by spreading it on a plate after each trial, and exposing it to the sun until it crystallizes anew. The inventor prepares a salt which will lower the temperature 28° C.—50° Fahr.—in the warmest countries.

**HOW BIRDS FLY.**—At a recent meeting in England to discuss aerial navigation, it was laid down as the proposition of the Aeronautical Society that flight was merely a mechanical action, capable of imitation, that it was unassisted by air cells or other contrivances for effecting levity, and that the balloon as a means of locomotion was useless to man except in the way of wafage. The wing of a bird was a structure which for strength and lightness combined we had no present means of imitating. After referring to the wings of different birds, the lecturer deduced from accounts read before his society, that long-winged birds could not manipulate their wings properly until they were somewhat raised from the ground, and that to obtain power upon the atmosphere the birds made a run, heaping before them a mass of air nearly equaling their own weight.

## SCIENTIFIC PROGRESS.

## Spontaneous Generation.

At the last meeting of the San Francisco Microscopical Society, a paper was read by Mr. H. C. Hyde, summarizing briefly the issue as they now stand between the upholders and opponents of the theory of spontaneous generation. Mr. Hyde takes the sides of the opponents, relying on the results gained by Dallingier and Drysdale, of these results he said: In the first place, it is conclusively shown that some form of the monads emitted palpable germs, visible, however, only with the 1-50th inch objective, and when visible of the size of about 1-200,000th of an inch. Others were, exactly speaking, *viviparous*, emitting no germs, but opening to give birth to minute living forms, while another form of monad emitted germs which the highest magnification failed to resolve, but the presence of which was indisputably proven by results.

In the second place it was conclusively shown that the different adult forms were capable of surviving varying degrees of heat ranging from 61° (142° F.) to 80° (175° F.) C., while the remarkable fact was developed that the sporules or germs were able to survive a temperature of 148.88° C. (300° F.)

From these facts they claim, and justly, I think, that the assumption of Bastian and some others, that the germs of putrefactive organisms must perish in the same conditions that destroy the parent is erroneous.

While this has not been actually shown of bacteria (the sole organism upon which the theory of spontaneous generation has been constructed) it may be strongly inferred that the bacterian germs are too minute to be observed by our present optical appliances, and it must be remembered that the monads are as much putrefactive infusoria as the bacteria.

Bastian, from certain infusions, produced both monads and bacteria. To guard against the introduction of supposed germs, he sealed up his infusions while boiling, and then subjected them to a temperature of about 300° F. Upon opening his sealed flasks, after the lapse of a sufficient interval, he found living monads.

Those he found were absolutely destroyed at a temperature of 140° F.; and upon this result, he regarded the theory of spontaneous generation, or archeogenesis, as he terms it, established.

While Tyndall and others have proved negatively that under certain conditions of temperature, and the absolute exclusion of possible germs in the surrounding air, living bacteria were never found, it remained for Dallingier and Drysdale, with the aid of the microscope and a marvellous stock of patience, to actually see that in the case of a closely allied form there was a positive production of germs from living monads, and that these germs, but not the parent forms, absolutely survived a temperature as high as that to which Bastian ever submitted his subjects; and that, after passing through this fiery ordeal, these same germs were seen to develop into the living, parent form, and in one instance, at least, into one of the identical forms described by Bastian, thus illustrating, I claim, beyond the possibility of a doubt, the source of the latter's error, and adding another and most valuable piece of testimony to the general question.

**WHICH IS THE RICHEST, MORNING'S OR EVENING'S MILK?**—This subject has now been put to the test of chemical analysis, and the result is that the evening's milk is found to be the richer. Prof. Boedeker analyzed the milk of a healthy cow at different periods of the day. The Professor found that the solids of the evening's milk (13%) exceeded those of the morning (10%); while the water contained in the fluid was diminished from 89% to 86%. The fatty matter gradually increases as the day progresses. In the morning it amounts to 24% at noon 34% and in the evening 53%. The practical importance of this discovery is at once apparent; it develops the fact that while 16 ounces of morning's milk will yield but one-half an ounce of butter, about double the quantity can be obtained from evening's milk. The casein is also increased in the evening's milk from 24% to 23%, but the albumen is diminished from 44-100% to 31-100%. Sugar is less abundant at midnight (44%) and most plentiful at noon (44%). The percentage of the salt undergoes almost no change at any time of the day.

**DIVISION OF LABOR IN SCIENCE.**—St. George Mivart remarks on this subject: "The principle of the division of labor renders necessary the application of one man's almost entire energy to a more and more restricted field of scientific labor. Only intellectual giants can now hope for eminence in widely remote areas of study and research. To take an example from one science, men have not only almost ceased to be general zoologists, and become ornithologists, entomologists, etc., as the case may be, but we hear of lives being devoted to the study of small sections of natural orders, and that this naturalist is a *Carabidist*, (that is, devoted to that family of beetles termed *Carabidae*), and that a *Curculionist* (devoted to the long-nosed beetles termed *Curculionidae*), while a German naturalist has even published a quarto volume, with large plates and numerous tables, the whole being devoted to the anatomy of the lower part of the hindmost bone of the skull of the carp."

## Ice Water at the Bottom of the Sea.

## The "Challenger" Discoveries.

At the last meeting of the Liverpool Geological Society, Mr. T. Mellard Reade, read a paper in which he pointed out the geological bearings of the information gathered by the *Challenger* expedition by deep-sea soundings and dredgings. As is well known from these physical observations, the basins of the great oceans are occupied in their lower depths with ice-cold water extending over the whole northern and southern latitudes, and consequently under the equator. This, Mr. Reade considered to be a remarkable physical fact, and proved that the secular cooling of the earth must be exceedingly slow, as the heat of the earth, apparently, did not influence the temperature of these vast ocean tracks, which are fed with cold water from the poles. It was also pointed out that the temperature of the ocean, decreasing with the depth, was the opposite to that of the solid earth, in which observations in mines and wells prove a general but varying increase of temperature downwards, so that at a zone 3,000 fathoms from the surface the temperature of the water is at freezing point; while on the land, in cases where the increase is 1° per 60 feet, on the same zone the temperature would be considerable above that of boiling water. Not the least interesting of the discoveries announced is that of the ocean bottoms below 2,000 fathoms being occupied generally—nay, almost universally—with a deposit of red clay containing pieces of pumice and nodules of peroxide of manganese, together with sharks' teeth and ear and other bones of whales; while the depths not exceeding 2,000 fathoms are largely occupied with foraminiferal ooze. These facts, it was considered, truly inferred a very great age for the present oceans as, from a calculation which cannot be detailed here, Mr. Reade considers it will take a minimum of 20,000 years for a deposit of foraminiferal ooze of an average depth of one foot to accumulate over the whole of the area occupied by it; while the red clay, the result of the decomposition of volcanic products, must be an exceedingly slow accumulation, probably not at the rate of one-tenth that of the ooze, but this rate is at present difficult to calculate.

**SINGING MICE.**—The question as to whether mice sing has been revived. M. Prieur, says the *New York Tribune*, described before the Society of Acclimatization his experience in La Vendee in 1851-3. He had bought an old cupboard which happened to contain mice. About sunset the mice began to sing. By lubricating the doors and hinges of the cupboard, M. Prieur was enabled to open it in one instance without disturbing the song. He literally caught the songster in the act. It was an old mouse, which held its nose in air like a dog when howling. Its song was like that of a wren. M. Prieur seized the mouse in his hand, but afterward allowed it to escape. On subsequent evenings the singing was renewed. There were no birds in the house. The utterance of a less musical sound has latterly been discovered as a part of the capacity of the scorpion, on the authority of Mr. J. Wood Mason, and described before the London Entomological Society. The experiments were made at Bombay, by teasing two large scorpions, placed face to face on a table. The sound is stridulous, somewhat like that from scraping a stiff brush with the finger-nails. An anatomical examination showed that the insect is provided with an apparatus consisting of a scraper and a rasp; these appendages could be made to give sound when separated from the scorpions after death.

**STRANGE NOISES.**—On a distant island in the Bay of Bengal, according to a German scientific journal, quoted by the *Journal of Chemistry*, there is a phenomenon known as the "Barisal guns," which is often heard at the beginning of rain, and is like the sound of firing of cannon. It seems to have no connection with the season, and sometimes comes from the north, sometimes from the south or southwest. Mr. Beveridge, who has collected some data on the subject, comes to the conclusion that these sounds are atmospheric and connected in some way with electricity. Mr. Home, in his report on the villages of the Himalayas, describes exceedingly powerful noises heard in the early morning among the highest mountain peaks, which can neither be ascribed to avalanches, nor be otherwise explained by the natives. Above the town of Koimhat, in Madras, at an elevation of 4,000 feet, is a pond from which the Lirivani springs, and which the natives carefully shun, because frightful noises rise out of it and roll away among the hills. The pond is very deep. Some of the phenomena may be of electric, some of volcanic nature.

## REPORTED EXISTENCE OF GOLD IN PERSIA.

—At a meeting of the Geological Society of London on the 7th instant, a communication from the foreign office intimated that the Earl of Derby had received a dispatch from Her Majesty's Minister at Teheran, reporting that a mining engineer had arrived there from Berlin, who, at the request of the Persian government, had been selected by Messrs. Siemens to ascertain what foundation there was for the reported existence of a rich vein of gold in the vicinity of Zengani; that he had visited the locality and reported that auriferous quartz does exist, but that he had not yet succeeded in finding any vein or deposit of metal.

Continued from Page 386.

all mankind have equal rights therein. A man is not permitted by law to burn his house in a crowded city or to fire a gun into a crowd; the latter is wisely declared to be malice against all mankind. How much less malice against all mankind exists when an ignorant and selfish individual destroys a forest, decreases rain, makes barren the once smiling face of nature, renders a land uninhabitable and shuts out future generations from their fatherland or dooms them to extinction? With a strange disregard of the economies of nature, the lessons of science and the teachings of history, showing the folly of a nation in permitting the absolute ownership of trees and forests, the woods of America have been held to belong absolutely to the owner of the soil, instead of holding them as a universal and common heritage for all the people and to be utilized only under proper restrictions. The loose public sentiment, ignorant of the wrong and danger that now tolerates it, does so to the loss and peril of the people. The principle of "the greatest good to the greatest number" is the only just one upon which to regulate forestry. A revision of the land laws is imperatively demanded; demanded because the folly and greed of so-called owners of forests are sacrificing them for private gain, limiting the life-sustaining rains and fast reducing the interior of this once lovely and fertile State to the awful solitude of a sandy and burning desert. Already the northern counties and the central foothills of the Sierras are receiving less winter rain and southern California has passed the bounds of producing any crop without irrigation. The dryness is increasing and can only be held in check and more rain be produced by a universal planting of forests. When a tree is felled upon the coast no young tree springs up to take its place, or if so, it soon dies of thirst or is eaten by starving sheep. The forest does not here spontaneously reproduce itself. It is the duty and interest of the public to protect itself against these abuses and imminent dangers or it will itself eventually perish. No mere public sentiment, no advice or sentimental appeals to duty, no warnings will avail to protect the trees of a country against the temporary necessities or greed of the owners or serve to secure the planting of new forests. The remedy must be a radical one, the forests must be the property of the Government and no private parties should control them, in so far as to be able to injure them, and new forests must be planted and maintained at the public expenso. No man should own a forest, but he should hold it of the Government for his use only while no waste is committed. Woodland should only be leased, never sold, and penalties of bodily punishment and forfeiture of the lease should be enforced against those committing waste. The issue is between fertility and a lovely climate, and an approaching desert. Rain and trees complement each other.

This may seem strange doctrine to advocate, in these days when society holds money to be the only thing valuable, and honor and duty to be of no particular worth, yet it is not so strange as that the public should calmly tolerate their own approaching but preventable extinguishment, that they should sit indifferently and stupidly by their half desertic fields and barren hills, not knowing the cause of the poverty and barrenness, or unwilling to adopt the only possible

#### Remedy for a Malady

Which is fast hurrying California down to a tomb of burning sand.

A vigorous government of the people, owning the woodland and leasing it in small lots for stipulated sums in lieu of taxes, would not only preserve the present woodlands, but would also cover the hills and mountains with new forests to the very summits. A most agreeable and beneficent change would result. Summer rains would then be assured, slight at first and of no immediate value, but as the trees grew, increasing in size, so would the summer rains increase in volume. The mountain grasses and shrubs, the vegetation of the valleys, would spring forth luxuriantly; the mountains would be ever verdant with foliage, the valleys ever smiling with flowers and fruit; the inland streams run ever full of living water, new streams and springs burst forth; irrigation would be everywhere unnecessary; the "alkali" would be dissolved; the sands covered with sods; the summer cold of the coast and the furnace heat of the interior would be succeeded by warmer weather on the one side and a cooler climate on the other; the interior summer climate, far from producing sickness and weakness as now, would be deliciously cool, adding increased strength and vitality; the violence of the trade wind upon the coast would be lessened; a healthier and more highly endowed generation of people than the present would soon be developed; the State would rapidly increase in population and all material resources; and no more desirable place for residence, health and advancement could be then found in the world than in California.

Most of these advantages could be attained in 50 years, did an enlightened public sentiment upon this question exist. But it does not exist; between ignorance of the danger of the approach of the desert and of the remedy; between selfishness and indifference to the rights of others, and of posterity especially, nothing will now be done. The human race advances most, and its experience is most valuable, when accompanied with suffering. The public must suffer still more before they can understand their rights and wrongs; before they can realize the extent of their dominion over nature in the production

of rain and the conquest of the desert; before they can unselfishly do good to others and to posterity. The Pacific coast is becoming dryer, but it must become almost entirely dry; the desert is approaching, but its sand must roll through every county; a large part of the State and adjacent territory is already a desert, treeless, waterless and uninhabitable, but it must remain so till, educated by suffering, the wisely directed labors of the people have regenerated it and converted it into a fragrant garden of the gods.

#### Mars and His Moons.

[Abstract of a paper read before the California Academy of Sciences by PROF. JOHN LECONTE.]

There is no member of the solar system, with the exception of our moon, which can be studied under such favorable circumstances as the planet Mars; for, although Venus, when in inferior conjunction, is nearer to us than Mars in opposition, yet Venus, at this time, turns her darkened hemisphere towards the earth. Moreover, although Mars does not appear so large an object in the telescope as Jupiter, yet he is in reality seen on a much larger scale, not only on account of his much greater proximity to us, but because, being likewise much nearer the sun, his surface is much more brilliantly illuminated, so that a much higher telescopic power can be advantageously employed. Accordingly, ever since the invention of the telescope, Mars has been a favorite object of observation. The largest and most powerful instruments have been employed to scrutinize this planet, and the varied physical details of its surface have been most carefully mapped by many astronomers.

When, therefore, it was announced, a few months ago, that the American astronomer, Hall, had discovered two satellites belonging to Mars, we ought not to be surprised at the astonishment with which the news was received by the scientific world. Moreover, there can be no question that for more than two centuries past astronomers have recognized the probability of the existence of satellites to this planet. In fact analogy would lead us to expect that Mars would be furnished with one or more moons; for, being situated at a greater distance from the sun than the earth, it seems more especially to need such luminaries to cheer its dark nights. Under the influence of these anticipations, the astronomers who have so carefully studied the physical features of Mars, have doubtless been looking for these satellites. In fact, many of them have contended that the failure to discover them is not by any means a conclusive proof of their non-existence; since Mars, being a very small planet, we might expect his moons to be proportionally small, in which case they might escape detection by the telescope. Thus, for example, the second satellite of Jupiter is only about the forty-second part of the diameter of the planet; and a satellite which would only be the forty-second part of the diameter of Mars would be about 100 miles in diameter. At the least distance of the earth from Mars a satellite of this dimension would subtend an angle of less than one-half of a second; so that even in the most favorable position of Mars, powerful telescopes might fail to reveal such an object especially if it do not recede far from the disk of the planet.

This state of doubt and uncertainty in relation to the question of the existence of Martial moons afforded legitimate game for the satirical writers of the last century. Thus, Jonathan Swift (more familiarly known as Dean Swift), in his "Gulliver's Travels," published about 1727, in giving an account of the extraordinary race of abstract philosophers who inhabited the "Floating Island" called Laputa, informs us that: "They spend the greater part of their lives in observing the celestial bodies, which they do by the assistance of glasses far exceeding ours in goodness. For, although their largest telescopes do not exceed three feet, they magnify much more than those of 100 with us, and show the stars with greater clearness. This advantage has enabled them to extend their discoveries much further than our astronomers in Europe; for they have made a catalogue of 10,000 fixed stars, whereas the largest of ours does not contain above one-third of that number. They have likewise discovered two lesser stars or satellites, which revolve about Mars; whereof the innermost is distant from the center of the primary planet exactly three of its diameters, and the outermost five; the former revolves in the space of 10 hours, and the latter in 21½; so that the squares of their periodical times are very near in the same proportion with the cubes of their distances from the center of Mars; which evidently shows them to be governed by the same law of gravitation that influences the other heavenly bodies."

About 25 years after Swift wrote the foregoing, that is in 1752, the celebrated Voltaire, apparently in imitation of "Gulliver's Travels", cuttingly ridicules the pretensions of the class of reasoners who found their conclusions upon analogy. In one of his satirical tales Micromegas, an imaginary inhabitant of Sirius, is supposed to make a voyage of discovery through the solar system in company with a denizen of Saturn; they philosophize as they go. Approaching the planet Mars, Micromegas and his companion plainly described two moons acting as satellites to that body—moons which have certainly escaped the ken of terrestrial astrono-

mers. "I know perfectly well," continues the author of the tale, "that Father Castel (an astronomer of the time) will write, and write sufficiently pleasantly, too, against the existence of these two moons; but I appeal against his decision to logicians, who reason from analogy. These excellent philosophers are perfectly aware how difficult it would be for Mars—a planet so far removed from the sun—to get on with less than two of these satellites." (Œuvres de Voltaire—Micromegas, Chap. 3.) How completely the recent discovery of the American astronomer has "turned the tables" on the renowned satirist of the last century! The provisions of those "excellent philosophers" who founded their conclusions upon analogical reasoning, although slumbering in the domains of the unproven for more than two centuries, have at last been verified by direct observation. Why the Discovery of the Satellites was not Made Sooner.

As the moons of Mars are very small objects, it is only under the most favorable circumstances that they can be seen by the most powerful telescopes. Mars is nearest to us when his position occurs when he is near his perihelion; and the greatest possible proximity to us occurs when Mars is in opposition in perihelion and the earth is in aphelion at the same time. The oppositions of Mars near perihelion occur at intervals of 15 and 17 years successively. A very good opposition occurred in 1862; and a great many distinguished astronomers embraced the opportunity of scrutinizing Mars with the aid of excellent instruments. A still more favorable opportunity was presented in the summer of 1877, when Mars was nearer to us than it has been since 1845. It was at this time that Prof. Asaph Hall was fortunate enough, by means of the new 26-inch refractor of the Naval Observatory at Washington, to discover two moons belonging to this planet. It is true that this was probably the first time that so powerful a telescope had ever been directed to the examination of Mars under similar favorable conditions; yet, it is a significant fact, that since the announcement of the discovery the satellites have been detected by means of telescopes of more moderate power. The secret of Prof. Hall's discovery seems to have consisted in devising the means of cutting off, from the field of view of the telescope, the glaring light of Mars. In like manner, M. Henry, of the observatory of Paris, on the 27th of August, 1877, was able to see the satellites when Mars was screened from view. These diminutive moons nestle so closely to the planet that it is difficult to see them in the blaze of light reflected from Mars. Had similar means of screening the planet been employed, it is probable that one or both of these satellites might have been discovered in 1862.

#### Distances of Satellites from the Center of Mars.

The distance of the inner satellite from the center of the primary is about 2.73 times the radius of Mars; that of the outer one about 6.846 times the same radius. Assuming the diameter of Mars to be about 4,200 miles, these distances become, respectively, 5,733 and 14,376 miles from the center of Mars. The nearest satellite of Jupiter is distant about six times the radius of the primary, and the innermost satellite of Saturn is distant a little more than three times the radius of that planet.

#### Periods of Sidereal Revolution of the Satellites of Mars.

Prof. Newcomb gives, for the period of revolution of the inner satellite around Mars, about 7.65 hours, or 7h. 39m., and 30.25 hours, or 30h. 15m. as that of the outer moon. Both of them, like our moon, revolve around the primary from west to east. Mars rotates on its axis from west to east in 24.623 hours, or 24h. 37m. 23s.; this is the duration of the Martial day, or the time occupied by a star rising in the east in passing over to the western horizon of the planet. We have seen that the period of revolution of the inner satellite is less, while that of the outer is greater, than a Martial day. It is evident, therefore, that, as seen from the surface of the planet, the apparent motion of the satellites will be in opposite directions, the inner rising in the west and setting in the east, the outer (like our moon), rising in the east and setting in the west. This anomalous condition of things must have greatly perplexed the primitive astronomers of Mars, and probably led them to the invention of cycles and epicycles to account for these appearances.

It follows that the phenomenon of two moons meeting in mid-heavens will be no unusual occurrence to the observers on the surface of Mars. The apparent motion of the fixed stars from east to west, produced by the rotation of the planet upon its axis, is at the rate of 14.62° per hour. The real motion of the inner satellite among the stars from west to east is at the rate of about 47.06° per hour, while that of the outer one is at the rate of 11.90° per hour. Hence it follows that the apparent motion of the inner satellite from west to east across the heavens to an observer on Mars, will be at the rate of about 32.44° per hour, while the apparent motion of the outer moon from east to west will be at the rate of nearly 2.72° per hour.

It likewise follows from the preceding calculations that the time elapsing between two successive meridian passages of the inner satellite will be about 11.09 hours, and the time elapsing between two successive conjunctions of the inner with the outer moon will be about 10.24 hours; consequently two conjunctions will occur in less time than it takes for Mars to rotate on

its axis, or than a Martial day. This satellite completes more than three orbital revolutions in a Martial day.

As the apparent motion of the outer satellite from east to west is at the rate of only about 2.72° per hour, it is obvious that the time elapsing between two successive meridian passages of this moon will be about 132.35 hours; so that there will be no less than 12 conjunctions with the inner moon in the course of a lunar day. It is likewise evident that the outer satellite will frequently be above the horizon of Mars more than 60 hours, during which period six conjunctions with the inner may occur. Moreover, as the outer moon will go through its cycle of phases in a little more than 30 hours, all of these changes may be accomplished while it is above the horizon of the observer on the surface of Mars.

#### Apparent Magnitude of Mars as Seen from His Satellites.

The apparent diameter of Mars, as seen by an observer on the inner satellite would be no less than 41.8", or about 78½ times the apparent diameter of the sun as seen from the earth; and from the outer moon the diameter of Mars would subtend an angle of 16.7", or about 31.3 times the apparent diameter of the sun as seen by us. Of course the apparent areas of the disk of Mars, as seen from his two satellites, would be in the ratio of the squares of these numbers. That is, the apparent area of the disk of Mars, as seen from his inner moon, would be 6,167, and from the outer 980 times the apparent area of the solar disk, as seen from the earth.

From the innermost satellite of Saturn, the diameter of the primary would subtend an angle of 35.8"; from the nearest satellite of Jupiter, the diameter of that planet would subtend an angle of 18.6"; and from our moon the earth's diameter would subtend an angle of less than 2".

#### Apparent Magnitude of His Satellite as Seen from Mars.

Astronomers are, as yet, ignorant of the real magnitude of the Martial satellites; but, assuming each of them to be 100 miles in diameter, it is easy to calculate their apparent magnitudes as seen by an observer on Mars. The inner moon being 5,733 miles distant from the center of Mars, would, when in the zenith of the observer, be only 3,633 miles distant from the surface of the planet. Hence it appears that when this satellite is seen in the horizon of the observer on the surface of Mars, its diameter would subtend an angle of about 60m., or nearly twice the apparent diameter which our moon presents to us; but, when it is in the zenith of the observer, it would subtend an angle of 94.3m., or more than three times the apparent diameter presented by our moon. In other terms, in rising from the western horizon to the zenith, the apparent diameter of this moon would be increased nearly in the ratio of two to three; and, of course, its apparent area would be augmented nearly in the ratio of four to nine.

The outer satellite would, under like positions, present apparent diameters respectively, of 24 and 28m., or considerably less than the apparent diameter of our moon. The nearest satellite of Jupiter (having a diameter of 2,310 miles) would, in like positions, present to an observer on the surface of that planet apparent diameters, respectively of 31m. and 37m.

#### Bearing of the Discovery of Martial Satellites on the Nebular Hypothesis.

As we have seen, the inner satellite of Mars completes three orbital revolutions in less than a Martial day. "This anomalous fact in the planetary system would seem, at first view, to be utterly inconsistent with the nebular hypothesis." According to this hypothesis, the orbital periods of the satellites should be approximately equal to the rotation periods of the primary at the epochs when the satellites were thrown off from it. The acceleration of the rotation period of the primary, in consequence of its subsequent contraction, would necessarily render its time of rotation less than the orbital period of any satellite. As far as yet known, the inner satellite of Mars affords the only instance in which the rotation period of the primary is greater than the orbital period of the secondary.

It must be remembered, however, that if we regard the rings of Saturn as composed of clouds of independently-revolving minute satellites, those constituting the innermost portions of the inner ring must revolve in less time than the rotation period of that planet. Under this view, therefore, the case of the inner satellite of Mars is not unique.

There are, however, several methods by which the apparently anomalous fact may be accounted for consistently with the nebular hypothesis.

1. In the first place, it has been suggested that Mars may not have obtained his satellites by means of the usual process of moon formation; but by the appropriation to himself of a couple of the numerous asteroids or planetoids, some of which, in their perihelion excursions, approach comparatively near to Mars in his aphelion positions. Thus, the planetoid called Phocæa, when it is at its least distance and Mars at his greatest distance from the sun, would only be about 11,000,000 of miles from each other. It is, therefore, possible that some of the planetoids, moving in orbits of greater eccentricity than any yet discovered, may, at some former period, have approached so near Mars as to have become permanently attached to it as satellites.

2. In the second place, it is possible that these Martial moons may have originally re-

volved in larger orbits, and therefore in longer periods than at present; but that the retarding influence of a resisting medium on such small masses, night, in the course of myriads of ages, have contracted their orbits and consequently shortened their orbital periods. In this connection it must be borne in mind, that, according to the nebular hypothesis, Mars must be a vastly older planet than the earth; so that this retardation may have been in progress for an incalculable number of centuries before the earth became a separate planet.

3. In the last place, it is possible that Mars may have originally rotated on his axis in five or six hours; but that the tidal rotation-retardation produced by the action of his moons might have brought about its present rotation period. It is evident that the solar tides, on a planet so small and so remote from the sun, must be inappreciable; and, at first sight, the lunar tides produced by such small masses might be supposed to be equally insignificant. But it must be recollected that the tide-generating power of a moon is (other things being equal) inversely proportional to the cube of its distance; so that nearness might more than compensate for smallness of mass. To be more specific: In the mathematical language the tide-generating power is in proportion to the

Diameter of Primary  $\times$  Mass of Satellite  
(Distance of Satellite).<sup>3</sup>

Thus, for example, let us suppose the diameter of our moon to be 20 times the diameter of the inner satellite of Mars, and both moons to be equally dense; then the mass of our moon would be 8,000 times that of the Martian satellite. Taking the diameter of the earth as equal to twice the diameter of Mars (and it is not so great), and the distance of our moon from the center of the earth to be  $4\frac{1}{2}$  times the distance of the inner satellite from the center of Mars; we then have the tide-generating power of our moon acting on the earth, will be to that of the

inner satellite acting on Mars as  $\frac{2 \times 8000}{(4\frac{1}{2})^3}$  to 1,

or as  $\frac{16000}{71473}$  to 1, or as  $\frac{1}{4\frac{1}{2}}$  to 1, or as 1 to  $4\frac{1}{2}$ .

Hence, the tide-generating power of this small satellite, would, in consequence of its nearness to Mars, be about  $4\frac{1}{2}$  times as great as the tide-generating power of our moon on the earth.

In connection with the idea of the rotation period of Mars having, at some former time, been much shorter than it is at present, it may be noticed that the great compression or ellipticity of this planet is totally inconsistent with its observed rotation period. Most astronomers estimate the ellipticity of Mars at from

$\frac{1}{40}$  to  $\frac{1}{60}$  (although some of them have

failed to detect any sensible difference in his equatorial and polar diameters); the ellipticity of the earth is only  $\frac{1}{300}$ . Might not this great

ellipticity of Mars have been the result of solidification having taken place when its rotation period was much shorter than it is at present? This explanation is not free from serious difficulties. For, if aqueous and aerial agencies were in action after solidification took place, they would have tended to make the shape of the planet conform to its new rotation period. Berkeley, Dec. 3d, 1877.

**HYDRAULIC MINING.**—The article on this subject from the pen of the well-known engineer, Aug. J. Bowie, Jr., which is now being published in the PRESS, is an especially valuable one, and our hydraulic mining friends will find it alone worth more than a year's subscription to the PRESS. The facts and figures given by Mr. Bowie are of great value as showing the results of practical work. A reliable article of this kind is more profitable for miners to read and study than any other class of literature. We advise those who do not usually file away the PRESS to commence keeping their numbers now and they will have this standard article as a whole. It has been carefully revised and corrected by Mr. Bowie and comprises the whole literature of hydraulic mining in California.

**SACK PRESERVING.**—A North German paper states that corn and other sacks may be effectually prevented from rotting, and otherwise made to do duty much longer than usual, by simply soaking them in a solution of oak-bark tan. The quantities recommended are two pounds of tan in 17 or 18 pints of boiling water, the clear solution being strained off after it has stood an hour. In this the sacks should lie for 24 hours, and then be well washed in fresh water and carefully dried.

**SINGLE RAIL LINE.**—The *Railway Age* says: The single rail principle seems not unlikely to come into somewhat extended use for short roads, particularly in hilly regions, where a graded road-bed would be expensive and difficult on account of sharp curvatures. A road on this plan is being built in the Bradford oil district of Pennsylvania, and a car has been constructed for it running on two wheels, with two small wheels on each side to maintain it in position.

## USEFUL INFORMATION.

**WOODEN MONEY.**—Advocates of inconvertible paper currency may perhaps derive some satisfaction and encouragement from the fact that from the reign of Henry I. down to the period of the establishment of the Bank of England the legal tender money of England was fabricated out of wood. This instrument was called an exchange tally, and by virtue of it the holder was entitled to receive from the Crown the value inscribed thereon. It really consisted of one-half of a four-sided rod or staff, on which, when in its entire state, the sum it purported to represent was carved in transverse notches, varying in width for thousands, hundreds, scores, pounds, shillings and pence. These signs were for the unlearned; for the advantage of those who could read, the sum was written in ink on two opposite sides of the staff, and, finally, with a knife and mallet the staff itself was split in two, longitudinally. One-half, called the tally or check, was given to the person for whose service it was intended; the other half, called the counter tally, was laid up in safe-keeping until its corresponding tally should be brought in by the person who had last given value for it. Its intrinsic value was, of course, only that of the wood of which it was composed, but by representation it denoted large sums. It was a current token of real money, and served actually to distribute it from man to man by exchange. From this primitive tally was derived the Exchequer bill, first introduced in 1696, by Mr. Montague, then Chancellor of the Exchequer. The word "Bill," too, was no doubt obtained from the Norman-French word, *bille*, which means a staff. Bank post bills and bills of exchange in our own day came from the same wooden base, and soldiers are said at this hour to be "billed," because formerly they tendered wooden "bills," or tallies to the victuallers upon whom they were quartered. In olden times officers of the army were taken into the king's own pay, were said to be put on the staff, that is they were paid with Exchequer tallies, or wooden money. —*British Trade Journal*.

**SHAVING SOAP.**—To obtain a good soap for shaving, says the *Druggists' Circular*, is by no means always easy. The great desideratum is to have a soap that makes readily a rich lather which is slow to dry and that does not require the ceremony of calling for hot water. The most convenient for use are in the shape of paste, so that a little may be taken on the finger and rubbed over the beard, then the brush finishes the process of preparation for the razor. If we take the following ingredients and compound them an excellent soap is produced that leaves nothing further in this respect to be desired: Take white soap, four ounces; spermaceti, one-half ounce; olive oil, one-half ounce. Melt them together and stir until nearly cold. Scent with such oils as may be most agreeable. Another soap may be made by taking white wax, spermaceti and almond oil, of each, one-quarter ounce. Melt and, before cooling, rub in two cakes of Windsor soap, which have previously been reduced to a paste, with a small quantity of rose water. This last, probably, is not unlike a superior shaving soap that has long been in use, and is known as "Rypophag" soap, a first-rate thing with a very wonderful name.

**EFFECTS OF SEA WATER ON LAND.**—Mr. Rein- ders, from one of the German agricultural experimental stations, says: "Land that has been submerged by sea water generally proves sterile for some time, in some cases for 10 to 15 years. This can be traced to the co-operation of the three following chemical causes, in addition to the mechanical injuries produced by the inundation: 1. To the introduction of too great a proportion of chlorine salts. 2. To the hygroscopic property communicated to it, preventing it from drying properly. 3. From the formation of green vitriol or sulphate of iron, which is known to exert a very prejudicial effect upon plant growth. Land which has thus been damaged should be drained as quickly as possible, sown with grass and clover, and allowed to rest. Experience shows that it recovers its fertility sooner if treated in this way than if cultivated all the year round as arable land."

**SELLING JEWELS TO SAVE LIFE.**—Mr. Hynes, of the Bombay mint, has published a letter in which he says that for about three years before the famine the amount, counting silver and ornaments, tendered to the mint, averaged about 6,000 rupees (about £525) monthly. In October, 1876, the tender was about 4,000 rupees' worth, but in November it rose to 70,000 and kept steadily increasing up to September last, when it reached the value of 1,900,000 rupees (about £166,000), or more than 300 times the normal amount. It would appear from this meter that a great strain was felt about March, when the sale of jewels was about double that of the previous month. The pressure accumulated in force till July and the commencement of the southwest monsoon.

**WAXED RICE.**—Waxed rice seems a curious thing, yet, strange to say, it is now in the market. It appears that one or two per cent. of wax adds a peculiar luster to rice, and it makes it look so pretty that the Dutch are profiting much by preparing it for the English to use. Prussian blue is said to be added, and certainly the appearance of some samples bears out this statement.

**A THING WORTH KNOWING.**—The supply of French brandy, says the *British Trade Journal*, not being nearly sufficient for France alone, the residue of the French supply is made up by spirits imported from England and Germany. Under the old commercial treaty with France, the English trader got his raw spirit admitted on more favorable terms than the Germans, and so obtained a monopoly of the trade. A very large and profitable business is done by buying raw spirit at about 2s. per gallon, exporting it to France, doctoring and coloring it there, and then returning it to this country as fine French brandy. This does not seem to be quite a legitimate traffic, but there is a refinement of it that is at once more profitable and more illegal. Among the largest—the largest in fact—shippers of brandy are Messrs. Hennessy, of Cognac, who confine their trade to the higher classes of brandies. Casks with their brand upon them are worth a considerable sum of money. In England and at Hamburg there is a ready sale for such casks, which are at once filled with raw spirit, colored and doctored, costing at the outside 2s. 6d., and then sold as "Hennessy's" best, at about 12s. per gallon. Even blockade running was not supposed to yield such profits!

**WASHING FLANNELS.**—A lady correspondent says: "I will give a little of my experience in washing flannels. I was taught to wash flannel in hot water, but it is a great mistake. In Italy my flannels were a wonder to me; they always came home from the wash so soft and white. I learned that the Italian women washed them in cold water. Many a time I have watched them kneeling in a box, which had one end taken out, to keep them out of the mud, by the bank of a stream, washing in the running water, and drying on the bank or gravel, without boiling; and I never had washing done better, and flannels never held so well. I have tried it since, and find the secret of nice soft flannels to be the washing of them in cold or lukewarm water, and plenty of stretching before hanging out. Many recipes say, don't rub soap on flannels; but you can rub soap on to the advantage of the flannels, if you will rinse it out afterward and use no hot water about them, not forgetting to stretch the threads in both directions before drying. Flannels so cared for will never become stiff, shrunken or yellow."

**GLUE FOR POLISHED STEEL.**—The Turks glue diamonds and other jewels to their metal settings with a mixture made as follows: Dissolve five or six hits of gum mastic, each the size of a large pea, in as much spirits of wine as will suffice to render it liquid. In another vessel dissolve in brandy as much isinglass, previously softened in water, as will make a two-ounce phial of strong glue, adding two small bits of gum ammoniac, which must be rubbed until dissolved. Then mix the whole with heat. Keep in a phial closely stoppered. When it is to be used set the phial in boiling water. This cement perfectly resists moisture, and it is said to be able to unite effectively two surfaces of polished steel.

**RABBITS AND FRUIT TREES.**—A correspondent of the *Western Ruralist* says: I have used various remedies to prevent rabbits gnawing fruit trees, and the best is the following: Take soft soap and sulphur—not particular as to proportions, so there is enough soap to incorporate the sulphur, so that every part of the mass will readily adhere to the trees. This does not so readily wash off as soap alone, and the sulphur is probably more repulsive than any other cheap and convenient article.

**A SAPONACEOUS INSECTICIDE.**—A soap, insoluble in water, may be made by mixing castile soap with a solution of sulphate of alumina, sulphate of iron, or sulphate of copper; copper making the mixture green, iron leather-colored, alumina colorless. It may be applied by melting, or by solution in petroleum or other volatile hydrocarbons. If the solution is not perfectly fluid, it should be warmed.

**BLEUING IRON AND STEEL BY BOILING.**—If iron or steel articles be boiled in the following mixture they will take a fine blue tint: Dissolve four ounces hyposulphite of soda in one and one-half pints of water, and then add a solution of one ounce acetate of lead in one ounce of water.

## GOOD HEALTH.

### The Abuse of Athletics.

We notice that English journals are wisely condemning the modern idea of athletic exercises, which consist of walking matches in public halls, etc. Such feats of pedestrianism and other similar extravaganzas in athletics are unnatural, and cannot fail to be more or less injurious, especially to those who have not been prepared for them by a long course of "training." Certain "professional" pedestrians and gymnasts may perhaps attempt these performances with comparative impunity; or if not, the world can well pardon the fools for shortening their useless or worse than useless career. Indeed, the sooner they kill themselves the better; for their example is pernicious in the extreme. Other people, who, but for the cheap notoriety gained by these muscular idiots, and the silly ambition to win similar "laurels" for themselves, would never think of attempting such preposterous feats, are carried away with the mania, and suffer irreparable injury to health.

We have been sorry, says the *Journal of Chemistry*, to see the newspaper eulogies of Miss Bertha von Hillern's pedestrian achievements. She is held up as an example of what women may do if they will, and is encouraged to go on to more extraordinary exploits in the same line. Now there can be no question that American women do not walk enough. In that respect, they are far behind their English sisters, who think nothing of a walk of five or ten miles, and who may often be seen doing their 15 or 20 miles a day in the Scotch highlands or in Switzerland. There is no better exercise than snell "tramps" in the open air; they are wholesome alike for the body and for the mind, and it is a pity that Yankee girls do not readily take to them. But a treadmill round of so many miles in so many hours, in a public hall, with a crowd of idle gazers betting on the result as on a horse-race, is a very different thing; and we doubt whether it will stimulate more sensible women to more rational efforts of pedestrianism. It is likely rather to awaken a disgust for all exercises of the kind.

**CLEANLINESS.**—Dr. N. H. Paaren writes as follows in the *Western Stock Journal*: It is true in all cases known to us, that the finer instincts agree with the conclusions of laborious scientific research. The great laws of nature do not jar, but show a constant harmony; and it is pleasant to see the elucidation of these truths, which may sound too grand to be mentioned in connection with the operation of cleaning a stable. We cannot, however, refrain from admiring this harmony, when we see the busy housewife and clean, industrious maid scrubbing at floors and furniture, apparently perfectly clean, and washing and scalding dishes which we would at first sight think might be purified much more simply. Their instincts are true. You come into the room after the furniture has been scrubbed, and you breathe a fresher air, and are in fact a healthier, and therefore a happier and better being. You eat of these dishes—the food tastes better and it digests better; you therefore become, from this cause also, healthier and happier. The reason of this is, that the furniture receives upon its surface the organic matter arising from all living creatures, which after a time is apt to become unpleasant and unwholesome. Every chair, then, and every table, becomes a source of disease; every piece of the wall and the ceiling are the same. This is especially the case with the furniture most in use; every touch of the hand—even the whitest hand—is a source of impurity, and that which is used most has most need of being cleaned. Many porous bodies—and amongst these, cloth—take up these odors in great abundance, and sometimes retain them so much as not to give out any perceptible quantity until they are very much filled. We find this to be the case with carpets, which do not till after sometime become offensive and stifling, but when they are so, are very difficult to clean. The process of cleaning is too often confined to beating. It is to be hoped that washing of carpets will become more general. Until this is the case, we shall never get quite free from the unwholesome mists of some of our floors.

**FLATULENT DYSPEPSIA.**—At a recent meeting of the Paris Academy of Medicine, M. Leven read a paper on the gases of the stomach and flatulent dyspepsia. He is of opinion, says the *Journal of Chemistry*, that food does not produce gas, and that the gases which are found in the digestive tube proceed from the external air, the blood and fecal matter. These gases are continually put in motion by the pathological contractions of the muscular fibers of the intestines. Expelled by the mouth they are constantly renewed, and their production may be as incessant in a starving man as in one who is well fed. This symptom of production of gas, therefore, signifies an irritation of the stomach, which is always consecutive to a long-standing gastric dyspepsia. The progress of the disease and the treatment to be adopted for its cure confirm these data of clinical observation. There is no need to seek for any therapeutic agent to combat these gases.

**TO MAKE COW'S MILK MORE DIGESTIBLE.**—In a German paper we note a hint given by Dr. Schaaf with reference to the taking of cow's milk by persons who have a weak stomach. He says he has always succeeded in avoiding any evil effects by eating a little salt on bread either before or after taking the milk. When he omits to do this, a single glass of milk will produce diarrhoea, whereas with salt he can take a whole liter.

**POISONING BY EARRINGS.**—Two young girls in Paris suffered from blepharitis, and one of them also from an inflammation of the lower part of the left auricle. All the usual remedies proved inefficacious, but both patients quickly recovered after their copper earrings were discarded.

**CHARCOAL FOR OFFENSIVE BREATH.**—A correspondent of the *Dental Cosmos* says that the best treatment in regard to offensive breath is the use of pulverized charcoal, two or three tablespoonfuls per week, taken in a glass of water before retiring for the night.

**CONCLUSIVE.**—Lodger: "I detect rather a disagreeable smell in the house, Mrs. Jones. Are you sure the drains—" Welsh Landlady: "Oh, it can't be the drains, sir, whatever. There are none, sir!" —*Punch*.

Advertising Rates.	1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	\$ 2.00	\$ 5.00
Half inch (1 square).	\$1.00	\$3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing extraordinary type or in particular parts of the paper, inserted at special rates.

Four insertions are rated in a month.

SUBSCRIPTIONS IN ADVANCE.—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, Dec. 22, 1877.

## TABLE OF CONTENTS.

GENERAL EDITORIALS.—Stockholders and Mining Stocks; The Colling Moth; Improved Weighing Scales; Gould & Curry, 385. The Week; The Mechanics' Institute; Christmas; Academy of Sciences, 392. Hydraulic Mining in California—No. 11, 393.

ILLUSTRATIONS.—Mery's Improved Weighing Scale; Transformation of the Colling Moth, 385.

CORRESPONDENCE.—El Dorado County Mines, 386.

MECHANICAL PROGRESS.—Progress in Flour Milling; A Locomotive Set up in Three Hours; A Gas Governor; Cooling Water; How Birds Fly, 387.

SCIENTIFIC PROGRESS.—Spontaneous Generation; Which is the Richest, Morning's or Evening's Milk; Division of Labor in Science; Ice water at the Bottom of the Sea; Singing Mice; Strange Noises; Reported Existence of Gold in Persia, 387.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends, 388.

MINING SUMMARY from the various counties of California, Nevada, Arizona, and Oregon, 389-396.

USEFUL INFORMATION.—Wooden Money; Shaving Soap; Effects of Sea Water on Land; Selling Jewels to Save Life; Waxed Rice; A Thing Worth Knowing; Washing Flannels; Glue for Polishing Steel; Rabbits and Fruit Trees; A Saponaecous Insecticide; Cleaning Iron and Steel, 391.

GOOD HEALTH.—The Abuse of Athletics; Cleanliness; Flatulent Dyspepsia; To Make Cow's Milk More Digestible; Poisoning by Earrings; Charcoal for Offensive Breath; Conclusive, 391.

NEWS IN BRIEF on 396 and other pages.

MISCELLANEOUS.—Trees and Rainfall, No. 5, 388-390. Mars and His Moons, 390-391. Geological Work of the Hayden Survey During the Summer of 1877, 394-395.

## NEW ADVERTISEMENTS.

Situation Wanted as Smelter and Refiner, P. E. M., this office.

## The Week.

This week has been devoted to preparation for the holidays by those in a position to make such preparation. The stores are in full holiday attire and the streets are crowded with eager purchasers. The principal events occurring, which interest all Californians, were the advent of rain and the election of our United States Senator. Both are full of promise for the future; the one that it will bring us good crops and good times and the other that he will do everything the people want him to. What more welcome Christmas gift could have been made to the people of this State than the refreshing rains which the week has brought? Men prone to doubt and misgivings were beginning to give voice to the darkest apprehensions, and had not the gentle falling rains dissolved their hard anticipations, there would have been most dismal Christmas times in many homes. But the rains have come, and so far as present appearances go, they have washed clean the spotted theory which measures the downfall by a tarnished sun. Hearts are now as buoyant as a week ago they were despondent. All along the line of the coast counties and the adjacent valleys, over the great fertile region above the bay and the central region of the Sacramento and lower San Joaquin valleys, there has come a refreshing, a glorious rain.

A SAN DIEGO dispatch, December 15th, states that the placer mines near San Rafael, Lower California, cover a region of two miles by seventeen miles in size, and prospects in places are as high as 50 cents per pan and better. That may be so, but the places are few and far between, and there is hardly water enough in the country to wash clothes, much less placer dirt. There have not been many men who made fortunes in the San Rafael placers.

JAMES BALLANTYNE, of Edinburgh, the well-known author, is dead.

## The Mechanics' Institute.

An important and fully attended quarterly meeting of the Mechanics' Institute was held on Saturday evening last in the "Patent room" in the Institute building. President Hallidie was in the chair and read his report, which embraces a period of six months, the quarterly meeting of September having been omitted. We make the following extracts from the report: On account of the pressure for room by our largely increasing membership, and especially the demand for increase of reading facilities, the Trustees have been compelled to enlarge the area of the reading-room. The Trustees, for the past three years, have been from time to time seriously considering the matter of a new building, but so far have not been able to see the way clear for its purchase. The regular funds and income of the Institute are absorbed as fast as obtained, and the demand for new books is always ahead of the ability to provide; and unanticipated but necessary expenses keep the society more or less in debt. Our membership, while good and increasing, is far behind what it should be for a city with so large a population, and far behind what it should be, if the Mechanics' Institute was able to fulfill its mission, even in part, by a more direct interest in the educational and social status of its members, which it could have if provided with a building where it could furnish class rooms and halls for social reunions.

This society, with its 2,500 members, of working men and working women, children of toil, and the hands of each one of them are harder than his heart, have lived long enough in this bright California of ours, and have had hard years enough of bitter experience to wish well of his fellow-man, and to do to him as he would be done by, and, while standing up for his rights, does not forget the rights of others. The events of the past few months in this city cannot otherwise than cause a thinking man to reflect, and reflect deeply, on the influence of circumstances on the minds of men and the disposition of designing men to distort those circumstances to suit their own ends. The Mechanics' Institute is not indifferent to surrounding conditions, and while it recognizes the fact that many wrongs need righting, it cannot see that any retaliatory wrongs will make a right, and it utterly condemns the spirit of violence and incendiarism breathed by the false-hearted leaders, who are enemies of the mechanic and working man.

The receipts and expenditures for the past six months had been as follows: General fund—receipts, \$10,529.70; disbursements, \$11,955.52, leaving due to the Treasurer at this date, \$1,435.88. The sinking fund showed receipts amounting to \$2,212.82, and there was a balance in the treasury of \$2,122.82. The amount remaining unpaid and collectable was \$1,769.69, and there was outstanding bills to the amount of about \$4,000, principally due for books bought in London. The receipts of the last exhibition amounted to \$313,970.30; disbursements, \$314,113.71, leaving \$143.41 due the Treasurer. The steam engine exhibited by Hinkley & Co. at the eleventh fair had been bought by the Managers for \$4,000, and paid for from the proceeds of the last exhibition. Having completed their task the different gentlemen connected with the present building had assigned the property to the Institute for its benefit. The names were: A. S. Hallidie, P. B. Cornwall, Henry L. Davis, Asa R. Wells, J. Duffy, Ernest L. Ransome, James Drury, H. L. Smith, A. E. Fish, George Spaulding, James Spires, C. Waterhouse, J. B. Stetson, H. L. Hutchinson, James C. Patrick, Charles Elliott, H. W. Jones, Richard Savage, J. H. McDonald, John P. Curtis, A. S. Iredale, Samuel H. Wheeler. The building cost \$77,379.03; the gas, water and steam pipes and fittings, \$15,050.75; the steam engine, boilers, shafting, etc., \$16,106.61; the furniture, \$6,109.67. Total, \$114,646.25. As yet the Trustees had not determined whether an industrial exhibition should be held next year or not, but it was probable the exhibition would take place. As the lease would terminate shortly, the late Board of Exhibition Managers had been looking around for a suitable location, so that in the event of its being necessary, they could reconstruct it on other ground. In answer to A. D. McDonald, Mr. Hallidie said that the lease would expire on January 1st, 1880.

The President's report was received and adopted. The exhibition building is fully equipped, is in first-class order, and perfectly adapted to the purposes for which it was designed. A clause in the Constitution of the Institute prevents the Trustees from incurring any debt for purposes of exhibitions, and for this reason the Trustees have individually taken the burden on themselves, as the Board of Managers, and carried on the exhibitions. While, therefore, the responsibilities were taken on their own shoulders in case of deficiencies, all the profits were to be turned over to the Institute. The building now being entirely paid for, and free from any debt whatever, has been turned over to the Institute by the Board of Managers. One of the members took occasion to remark on the fact that it was a somewhat unusual thing now-a-days to see so great a trust given up with all the debts paid, and no whisper even of any misappropriation of a cent of the funds. A hearty vote of thanks was given to the Presi-

dent and Board of Managers for their valuable services and honorable actions.

Mr. Gallagher introduced an amendment to the by-laws to the effect that the library be kept open on Sundays. After some debate, this was referred to the Trustees.

A petition to both houses of the Legislature was presented, requesting, on grounds of public benefit, that an appropriation be made for the next two fairs of \$10,000 each year. Several members objected to this action, and the matter was referred to the Trustees.

There was considerable discussion over a proposed amendment to the Constitution, previously offered by Mr. Wheeler, which permitted a Trustee to be chosen without having to both live and have his business in this city. Under the present rule no resident of San Rafael, San Mateo or Oakland was eligible for Trustee. After a great deal of talk, the members thought they would rather have Trustees who lived in the city and county of San Francisco, as they would be more prompt in attendance at meetings.

Notice was given by Mr. Gallagher of several proposed amendments to the Constitution, which were laid over, under the rules.

## Christmas.

Again, on the current of the days, are we borne to the holiday moorings. It is an anchorage off a pleasant shore, hither we may go from our wearisome labors upon the deck of everyday affairs, and forget our cares amid the joyful Christmas pleasures and plenty. Here we may don our bright apparel and give the body, mind and soul full field to feast on Christmas bounty, to be glad in the double joy of Christmas offerings to loved ones, and to borrow new consolation and zeal from heartfelt Christmas devotion.

It is, indeed, well that the year is broken up for us, and that its heavy fragments are gilded on their edges by happy recreation days. We have gone by night through forests dense and dark, and yet the way has lost much of its terrors because we knew that here and there we should find a clearing and the glowing cabin fires would drive away the dread which the lonely travel pressed upon the mind. Upon many of us life's burdens rest quite heavily. The routine of toil has, perhaps, little to inspire of joy for its own sake. Our waking hours may be charged with cumbering cares, and our slumbers be too often broken by minds fighting mimic battles of life through the silent hours. To lives thus burdened, the gladness of holidays, with their merry makings and reunions, should come as angels giving rest and joyful diversions. Then the glad greeting of friends and relatives should bring convincing proof that affection does not grow old. Then the loving words of a wife should teach the heart that its deepest emotions can still gild the life with light and joy. Then the merry cries of happy children, sweet as the notes of song-birds in leafy groves, should fill the mind with thoughts of life's most precious treasures. And then, with the glory of an unselfish emotion, let thanks arise to the Giver of all these loves to live and labor for, and the inmost soul will grow with gladness at the assurance that "no man liveth to himself, neither dieth to himself."

We have read somewhere that the rejoicings which now mark the advent of Christmas time were introduced by the early church for the purpose of winning the people away from allegiance to the pagan rites and superstition, which were naturally enough carried over from the days of heathenism to the worship of the new-found Savior. The early converts were honest in their following of the Man of Nazareth, but their customs were strong upon them and they carried into His service the manifestations of devotions which they deemed acceptable to old Jupiter and his court of gods and goddesses. Hence arose the "manger songs" and "Christmas carols," the shining Christmas tree, the gift giving, and all the observances of the Christmas festival.

Whether this be the true origin of the custom which we now observe or not, it matters little, but certain it is that we may well use the day and its delights according to its reported early designs, although we are far removed from the days of paganism, we have tendencies and beliefs which it is just as essential to overcome to attain the nobility of thought and elevation of purpose which are among the possibilities of our lives.

We have alluded to the need of freeing the mind at times from the engrossing cares which the struggle for existence engenders. The modern sacrifice of the nobler virtues and aspirations in the rush for pecuniary advancement is the frequent theme for comment, and fitly so. It is a form of materialism more dangerous than that of the philosophers, because it comes upon us in the ordinary discharge of our avocations and gains control by most insidious steps. It steals upon us ere we are aware, and using such heavenly livery as is contained in the ideas of frugality, industry, devotion to purpose and the like, it gives us over at length to the demon of greed, of cruel selfishness and of debasing vain glory.

As an agency most potent to thwart the evil influence which thus saps our manhood, the thoughts most fitting to the Christmas time

come to us. "He who went about doing good" in the lanes and by-ways of Judea stands before the world, both in religious and secular literature, as the noblest example of self-sacrifice and of disinterested labor and suffering for others, which the mind of man can conceive of. No heart, into which can steal the faintest appreciation of his character, and which can arouse itself to the extent of the slightest emotion on the subject, can fail to perceive that the too prevalent self-serving of the day is false to even the human idea of the truth and nobility of manhood.

Starting with this as the central idea in the glad Christmas customs and observances, it is easy to perceive that its spirit gives life and significance to them all. From the "Merry Christmas" wishes of the early dawn, when the pattering of eager feet wakes us to hear the prayers of our children for our joy, up to the hospitable spread of bounty on our board, and the glad anthem of praise which fills cathedral's domes, the lesson which the day imparts is that of the joy of making others happy and in their joy to find our own. It is a noble thought. It is even nobler and higher than humanity. It is divine.

Thus would we preach our little Christmas sermon to our friends. Thus would we forget for the moment the topics which most engage our pen, and urge our readers to join with us in the thoughts which make us better for the thinking. As we remember the many thousand homes into which our Christmas greeting will come we are thankful for the opportunity to assure them all that the thoughts which we have commended are such as we feel for them. Sometimes the nearness which we feel to our kind readers amounts almost to the consciousness of a personal presence, and such it is today. As we greet you one and all, dear friends, let us urge upon you the deep significance of the Christmas greeting, and then, with earnest heart, we will wish you all a MERRY CHRISTMAS.

## Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Sciences was held on Monday evening, Prof. Davidson in the chair. Mr. J. R. Seupham gave the results of a series of meteorological observations made in the State, and referred to the apparent failure of the theory of 11-year periods of sun-spots, in relation to rainfall. Discussion among the members on this subject showed the general opinion to be adverse to the theory that the sun-spots have any known influence on rain supply.

Dr. H. Behr, read a paper on the "Resistance of the Eucalyptus to Ignition," which carried further the remarks made at previous meetings on the subject, and which we have already listed.

Prof. Davidson read an able and interesting paper "On the Necessity of a Physical Survey of the State of California." We shall publish this essay shortly, having secured the Professor's permission to do so.

It was stated that nothing had yet been done toward selecting material to be sent to the Paris exposition, but a meeting would be held to determine the matter.

The Nominating Committee to nominate a regular ticket, appointed under the rules by the Trustees and Council, submitted a report, re-nominating all the present officers of the Academy. This was done, as it was deemed injudicious to have any changes made while important business matters were pending with which those in office were familiar.

THE PRESS.—We present our readers this week with a paper replete with original matter of general interest. Prominent among the articles referred to are those "On Mars and His Moons," by Prof. LeConte, President of the University of California; a comprehensive review of the mines of El Dorado county; "Trees and Rainfall" by Mr. Purnell; a very valuable concluding chapter on "Hydraulic Mining in California," by Mr. Bowie, with tables of great interest to the engineering fraternity; a summary of the work accomplished by the Hayden Geological Survey in 1877; a timely article on Christmas, and one giving some points on necessary mining legislation; reports on the meetings of the Academy of Sciences and the Mechanics' Institute, as well as those of the Gould & Curry and Lady Bryan and Ophir mining companies. These, with the usual variety in the different departments, make up a number which prove the value of the PRESS more than anything we could say, and we hope our readers appreciate our efforts to carry on a first-class industrial journal.

WHAT IS IT?—"A mineral has been found in Kern county, California, which is puzzling the geologists, no one knowing what to call it. It is opaque; in color, tin white; lustre, metallic; laminated, soft, yields to the finger nail; leaves a streak the color of amalgam on the back of looking glasses; it is unchanged by a heat which reduces a Hungarian crucible; it is perfectly insoluble in nitric or muriatic acids, or any of their combinations, and has a specific gravity about equal to that of mispickel." [The above item is from an Eastern paper. If any of our readers know of this mineral we would like very much to see a specimen.—EDS. PRESS.]

[illegible]

Water.....\$0.008  
Labor.....0.030  
Material.....0.010  
Total.....\$0.060  
Average yield per cubic yard.....\$0.1019  
Average amount of gravel washed per inch water, cubic yards.....1.48

The following tabular statement shows the workings of a mine on 4 1/2 grades, high banks, and with a hydrostatic pressure ranging from 200 to 385 feet. The advantages of heavy grades and pressure, over the minimum La Grange grades, are clearly shown by the quantity of material moved, and a comparison of the work and costs will be of interest to those engaged in hydraulic mining. (See tables VI., and VII.)

Conclusion.

The question of the yield and costs of working hydraulic claims is one of great interest to the engineer. In estimating the production of gravel mines, the calculation of a given number of cents per cubic yard refers to the entire quantity of gravel moved or to be moved, since it is impracticable to wash out the gold-bearing strata without moving the entire superincumbent mass. The yield is, therefore, apportioned to the total quantity of ground washed.

Having prospected a claim, and ascertained the approximate value of the gravel per cubic yard, grade and quantity of available water being known, its yield can be estimated for a reasonable period.

In discussing the question of working unexplored localities, and even those already developed, it is to be observed that there are no known means which enable one to predetermine accurate economical results.

Therefore, in estimating the yield of gravel properties, even under the best of circumstances, the most careful opinion drawn from immediate facts is owing to the nature of deposits necessarily qualified.

Errata.

Page 297, first column, Milton mining and water company table. The heading, "Amalgam Yield in Avoirdupois," should extend over *Cut, Tunnel and Undercurrent.*

Page 329, second column, second paragraph under heading, *Damst* after word *foundation*, note should read as follows: This season (1877) on the lower side of each of the crib dams a stone embankment has been filled in and faced with heavy walls of dry rubble stone of large size. The old crib structures have been thoroughly overhauled and the skin of planking which is spiked to the water-face forming the water-tight lining has partially been renewed, and next year all the present unfinished work will be completed. The strengthening of these cribs will permit the reservoir to be filled to its fullest capacity.

Page 361, under heading, *Derricks*,\* omitted after word *sills*, on seventh line, foot note should read: "Generally an iron ring is sunk on the lower end of the mast from the middle of which end a short iron pin is arranged to project. When the mast is in position this pin fits in a hole bored in a heavy sill timber, which permits the derrick to be revolved as desired."

Page 361, first column, second paragraph, second line, stamped should read *tamped*.

RAPID ERECTION OF A BRIDGE.—The *Cleveland Herald* of November 24th says: "Mr. George Reed, Superintendent of Bridges on the Lake Shore road, has just completed the construction of an iron bridge at Elmore, in Ottawa county. The work of putting up the bridge, which is composed of two iron spans, each 108 feet, each weighing 60 tons, was completed in just seven days after the iron was delivered. While the work was being done the old bridge had to be kept in position, as trains were passing at all hours. The last connection for the new bridge was made Wednesday evening and trains allowed to run on it. The trestle work will be taken down at once."

### Geological Work of the Hayden Survey During the Summer of 1877.

The necessity of a careful examination of the various geological formations in the field, and a review, by a practical paleontologist, of the various districts that have from year to year been surveyed by the different geologists of this and other surveys, has been long felt. Such a work, indeed, was imperatively necessary, before a consistent and comprehensive classification of the formations could be established. This duty was assigned to Dr. C. A. White, the paleontologist of this survey; and he took the field at the beginning of the past season and continued his labors until its close. The special duty with which he was charged was to pursue such lines of travel as would enable him to make critical examination of the geological formations in succession as they are exposed to view on both sides of the Rocky mountain chain and also on both sides of the Uinta chain; to collect and study the fossils of these formations in such detail as to settle, as far as possible, the questions of the natural and proper vertical limits of the formations, their geographical range, their correlation with each other, and to define the paleontological characteristics of each.

He has pursued his researches with such success during the past season, as to demonstrate the necessity of continuing this class of investigations by various lines of travel, across what is generally known as the great Rocky mountain region; especially those portions of it that have been surveyed, as well as those in which surveys are in progress.

Among other important results, he has shown the identity of the lignitic series of strata east of the Rocky mountains in Colorado, with the Fort Union group of the Upper Missouri river; and also its identity with the great Laramie group of the Green river basin and other portions of the region west of the Rocky mountains. He also finds the planes of demarkation between any of the mesozoic and cenozoic groups, from the Dakota to the Bridger inclusive, to be either very obscure or indefinable; showing that, whatever catastrophic or secular changes took place elsewhere during all that time, sedimentation was probably continuous in what is now that part of the continent, from the earliest to the latest of the epochs just named. Other results and further details of the season's work will appear in the following paragraphs.

The general course of travel pursued by Dr. White during the season was as follows, not including the numerous detours, meanderings and side trips, which the work necessitated: Outfitting at Cheyenne he journeyed southward, traversing in various directions a portion of the great plains which lie immediately adjacent to the eastern base of the Rocky mountains in Colorado. The most easterly point thus reached was some 60 miles east of the base of the mountains, and the most southerly point about 25 miles south of Denver. Returning to Denver to renew his outfit, he crossed the Rocky mountains by way of Boulder pass through Middle Park. After making certain comparative examinations of the mesozoic and cenozoic formations in Middle Park, he proceeded westward to the headwaters of the Yampa river, following that

stream down to the western foothills of the Park range of mountains. Here resuming his comparative examinations of the mesozoic and cenozoic strata, he passed down to the valley of the Yampa as far as Yampa mountain, one of those peculiar and remarkable upthrusts of paleozoic rocks through mesozoic strata. In all this area, as well as that between the Yampa and White rivers, the Laramie group reaches a very great and characteristic development; and it received careful investigation, yielding some of the most important results of the season's work. Crossing the ground between the two rivers named, to White River Indian Agency; thence down White river valley about 100 miles; thence to Green river, crossing it at the southern base of the Uinta mountains, making many detours on the way, he reviewed the geology of the region which he had surveyed during the previous season. This review brought out not only the important paleontological facts before referred to, but it also added materially to the elucidation of the geological structure of the region which lies between the eastern end of the Uinta mountain range on the west and the Park range on the east.

Beyond Green river he pursued his travels westward, studying the mesozoic and cenozoic strata that flank the Uinta range upon its south side, and making comparisons of both their lithological and paleontological characteristics.

In this way he traversed the whole length of the Uinta range; crossing at its junction with the Wasatch range over into the valley of Great Salt Lake. Recrossing the Wasatch, to the north side of the Uinta range, he continued his examination of the cretaceous and tertiary strata into and entirely across the great Green river basin, leaving the field at the close of the season at Rawlin's station on the Union Pacific railroad.

A general statement of the results of the season's work have been given in a previous paragraph, but the following additional summary will make the statement somewhat clearer, being made after the route of the season's travel has been indicated. The formation of later mesozoic and earlier cenozoic ages, especially those to which Dr. White, in former publications, has applied the provisional designation of "post-cretaceous" have received particular attention. The extensive explorations of Dr. Hayden in former years, and the paleontological investigations of the late Mr. Meek, pointed strongly to the equivalency of the Fort Union beds of the upper Missouri river, with the lignitic formation as it exists along the base of the Rocky mountains in Colorado; and also to the equivalency of the latter with the Bitter creek series, west of the Rocky mountains. The investigations of this year have fully confirmed these views by the discovery not merely of one or two doubtful species common to the strata of each of these regions, but by an identical molluscan fauna ranging through the whole series in each of the regions named.

This shows that the strata just referred to, all belong to one well marked period of geological time, to the strata of which Mr. King has applied the name of "Laramie group" (Point of Rocks group, of Powell). His investigations also show that the strata which, in former reports by himself and Prof. Powell, have been referred to the base of the Wasatch group, also belong to the Laramie group, and not to the Wasatch. He has reached this later conclusion not merely because there is a similarity of type in the fossils obtained from the various strata of the Laramie group with those that were be-

fore in question, but by the specific identity of many fossils that range from the base of the Laramie group up into and through the strata that were formerly referred to the base of the Wasatch. Furthermore, some of these species are found in the Laramie strata on both sides of the Rocky mountains. Thus the vertical range of some of these species is no less than 3,000 feet, and their present known geographical range more than 1,000 miles.

Besides the recognition of the unity of the widely distributed members of the formation of this great geological period; bounded by those of undoubted cretaceous age below and those of equally undoubted tertiary age above; his further observations have left comparatively little doubt that the "Lake Beds" of Dr. Hayden as seen in Middle park, the "Brown's park group" of Prof. Powell and the "Uinta group" of Mr. King all belong to one and the same epoch, later than, and distinctly separate from the Bridger group. In that portion of the region which lies adjacent to the southern base of the Uinta mountain range, and which is traversed by Lake Fork and the Dan Chene river, not only the Uinta group but both the Green river, and Bridger groups also, are well developed, each possessing all its peculiar and usual characteristics as seen at the typical localities in the great Green river basin, north of the Uinta mountains. This added to the known existence of Bridger strata in White river valley, and the extensive area occupied by the Green river group, between White and Grand rivers, has added very largely to our knowledge of the southward extension of those formations.

In all the comparative examinations of the formations or groups of strata that have just been indicated, he has paid special attention to their boundaries, or planes of demarkation; crossing and recrossing them wherever opportunity offered, noting carefully every change of both lithological and paleontological characters. While he has been able to recognize with satisfactory clearness the three principal groups of cretaceous strata, namely, the Dakota, Colorado and Fox hills, on both sides of the Rocky and Uinta mountains respectively, they evidently constitute an unbroken series, so far as their origin by continuous sedimentation is concerned. While each of the groups possesses its own peculiar paleontological characteristics, it is also true that certain species pass beyond the recognized boundaries of each within the series.

The stratigraphical plane of demarkation between the Fox hills, the uppermost of the undoubted cretaceous groups and the Laramie group, the so-called post-cretaceous, is equally obscure; but the two groups are paleontologically very distinct, inasmuch as the former is of marine origin, while the latter, so far as is now known, contains only brackish water and fresh water invertebrate forms. He reports a similar obscurity or absence of a stratigraphical plane of demarkation between the Laramie and Wasatch groups, although it is there that the final change from brackish to entirely fresh waters took place over that great region. Furthermore, he finds that while the three principal groups of the fresh water tertiary series, west of the Rocky mountains, namely, the Wasatch, Green river, and Bridger groups, have each peculiar characteristics, and are recognizable with satisfactory distinctness as general divisions, they really constitute a continuous series of strata, not separated by sharply defined planes of demarkation, either stratigraphical or paleontological.

During the process of the field work as above indicated, large and very valuable collections of fossils have been made, all of which will constitute standards of reference in the future progress of the work, and quite a large number of the species are new to science. These are now being investigated, and will be published in the usual paleontological reports of the survey.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

the locators enthuse over it as the "biggest thing in the mountains." Larkin calls it the Queen of Hearts. W. R. Hellings has sold the Golden Star mine, in Cave Creek mining district, for \$75,000. San Francisco parties are the buyers.

### Oregon.

**STERLING DITCH.**—Oregon Sentinel, Dec. 12: Work on the Sterling ditch is being pushed so vigorously that it is anticipated that water will be running through the pipe before the expiration of another week.

**ENTERPRISE.**—Messrs. Smith & Courtney are engaged in sinking a shaft on the divide where crossed by the Applegate road, south of town. They expect to strike the channel that fed Rich gulch.

**THE EMBELINE.**—We learn from Mr. M. Caton, the Superintendent of the Embeline quicksilver mine, that the amount of ore reported this fall was 11,225 pounds, and the yield in quicksilver 6,273 pounds, or nearly 57%. The company is now sinking on good ore, and expect to make a profitable run in the spring.

**RICH ORE.**—Prof. Tierman, the mining expert, passed north on Monday. He had just returned from an examination of the quartz mine near Brownstown, opened a couple of years ago by an individual named Kelly, and abandoned as unprofitable. The Professor mined 650 pounds of rock taken without selection from the dump, and cleaned up \$32, making a yield of \$96 per ton.

### New Incorporations.

The following companies have filed certificates of incorporations in the County Clerk's office, at San Francisco.

**BOOKER G. M. Co.**—Dec. 19th.—Capital stock, \$1,000,000. Directors—John Neale, F. Homer, Hy. Williams, S. M. Boone and J. P. Fouse.

**ROYAL ARCH M. Co.**—Dec. 11th. Capital stock, \$12,000,000. Directors—Mark M. McDonald, J. G. Riley, C. H. Silberman, John L. Murphy and Philip Corcoran.

**EXCHANGE M. & M. Co.**—Dec. 20th. Locat on: Nevada. Capital stock, \$200,000. Directors—T. B. Fargo, W. J. Smith, E. McGary, James Morgan and B. F. Jefferson.

**OAKLAND M. Co.**—Dec. 19th. Capital stock, \$300,000. Directors—J. W. Thompson, John Krutz, C. C. Riser, W. H. Sibaeker and D. P. Blue.

**PARK'S GRAVEL M. Co.**—Dec. 10th. Locat on: Cal. Capital stock, \$100,000. Directors—H. P. Gregory, C. W. Banks, G. W. Cummings, D. P. Bellnap and A. Jenks.

**SPALDING G. & S. M. Co.**—Dec. 19th. Locat on: Mono county, Cal. Capital stock, \$10,000,000. Directors—A. F. Bryant, W. A. Seales, L. Slessonger, G. C. Carter and J. Berolzheimer.

### News in Brief.

NEW YORK is having a cat show.

CONGRESS has adjourned until January 10th. The Senate has passed the five-cent car-fare bill.

THE revolution in San Domingo is rapidly spreading.

A MOVE is on foot to establish a mechanics' institute in Oakland.

IT is expected that Oakland will have a free postal delivery next year.

THE amount of customs dues paid at this port last week was \$68,331.

THE Tennessee Senate proposes to pay 50 cents on the dollar of the State debt.

FOR the year ending Nov. 30th, there were 703,658 visitors at the Golden Gate park.

BEN. HOLLADAY'S daughter, the Baroness de Bussiere, died in New York on Sunday.

THE old Watts tannery, on Peralta street, Oakland, was destroyed by fire on Sunday last.

GOVERNOR McCORMICK has been unanimously confirmed as Commissioner-General to the Paris exposition.

THE Sheffield (Eng.) iron workers have received notice of a reduction of wages after the holidays.

THE British expeditionary force from the predatory Naga tribes have occupied their principal village.

THE San Jose Argus complains of the prevalence of diphtheria in that city. It also prevails in Visalia.

A BABY show to last one week is announced to be opened at Pacific hall, in this city, on Monday, January 14th.

THE aggregate deficiency of the several funds and accounts of this city is \$156,572, the largest being that of the street department, \$108,000.

ABOUT 2,500 sacks of grain were saved from the barge Governor Hayes, which sunk in the Sacramento river last week.

IT has been snowing heavily in the Balkan mountains and the "passes" have been rendered impassable to troops.

THE Treasury now holds \$345,593,550 in bonds to secure national bank circulation, and \$14,038,000 to secure public deposits.

THE cargo has been all taken out of the wrecked steamer *Continental*, at Bel river, but the vessel will probably be a total loss.

TYLER, of Collateral Savings Bank notoriety has decamped, and his bonds, amounting to \$29,000 have been declared forfeited.

THE rain of last Friday and Saturday was so violent on the Colorado desert that several miles of railroad track was washed away.

A NATCHES, Miss., editor has got ahead of his professional brethren elsewhere by being the first one to call his paper the *Telephone*.

A CHICKEN ranchman named Carlo, residing out on the San Bruno road, was murdered for his money last Saturday night. The murderers were not caught.

THE *Territorial Enterprise* declares the labor market of the Comstock to be over-crowded and discourages any further influx of working-men to that quarter.

THE Castle Garden Labor Exchange, New York, provided 893 immigrants with employment last month. The average wages for farm laborers were \$8 a month, with board, and day laborers \$1.25 per day.

COLONEL WELLESLEY, the British Military Attache, says that Osman Pasha had less than 30,000 men at Plevna, and in his sortie lost 6,000 in killed and wounded.

SIXTY THOUSAND more Russians are to be mobilized.

THE British Parliament has been called to meet January 17th.

THE Indians about Healdsburg are to be taken to the Round Valley reservation.

THE new Commissioner of Indian Affairs, Hoyt, has taken the oath of office.

OVER 1,000 Chinamen left this city for China this month, by steamer and sailing vessels.

THE Columbia salmon hatchery is reported to be in successful operation.

SENATOR JONES thinks the silver bill will pass the Senate by a large majority.

THE Pope has granted a dispensation, authorizing the marriage of the King of Spain with the Princess Mercedes.

THE schooner *Marietta* was wrecked on Humboldt bar on Sunday evening. Vessel a total loss, but all hands saved.

A VIOLENT cloud burst occurred in Brea canyon, Los Angeles county, on Tuesday. A man who was driving up the canyon was drowned.

THE naval court of inquiry into the *Huron* disaster, concluded that it was the fault of the officers through errors in navigation.

THE *Christian Ballot* is the name of a new "prohibitory" temperance paper by Jesse Hohnson, San Jose.

Two or three thousand workmen, engaged on the enlargement of the Lachine canal, Canada, have struck and quit work.

A PROJECT is on foot by the Government to obtain the money and property that belonged to the Confederacy, which is now said to be in Europe.

THE jury in the Creighton murder case, at Cincinnati, after a deliberation of 26 hours, returned a verdict of manslaughter, which is considered a compromise verdict.

IT is generally believed in Constantinople that the Porte's plea for mediation of the Powers will have no result. England will continue to observe neutrality.

THE National Reform Convention to advocate an express acknowledgement of God in the Constitution, met at Rochester, N. Y., on Tuesday. Two hundred delegates were present.

A LARGE majority of the Northumberland collieries have stopped work, as the men seemed determined to resist the proposed reduction of 12½% in their wages.

THE prospect of the House now seems quite good for the passage of a bill extending for ten years the time allowed to the Northern Pacific Railroad Company to complete its line.

THE remains of an elegantly dressed child, about a week old, were dug up on Summit street, Virginia City, on Saturday, encased in a soap-box. It was found that the child had been murdered.

THE House Committee on Indian Affairs substantially agreed to report a bill on the re-assembling of Congress, allowing five Indian tribes in the Indian Territory to be represented by a delegation in the House.

THE Russian Minister of Finance has notified loan contractors that he has determined not to receive the second installment of the war loan, amounting to 15,000,000 marks, an option of refusing which he had reserved.

A COMMITTEE of the National Association of General Railway Passenger Agents, at a meeting at Chicago, have reported in favor of discontinuing all excursion rates and tickets at all seasons of the year.

THE shipments of treasure overland by Wells, Fargo & Co. during the first half of the current month were \$2,077,250, of which \$1,095,500 was silver coin and \$854,100 gold coin. The quantity of silver shipped is unusually large.

A WASHINGTON special says: The President's message on the Civil Service, which will be ready to send to Congress soon after the holidays, will show that the President does not intend to surrender any of the positions which he has assumed in his controversy with the Senate.

Two sailing ships and a steamer will sail in February and March, under direction of the Secretary of the Navy, with goods for the French International exposition. The Commissioner of Agriculture will prepare an extensive display of cotton, tobacco, wool, Indian corn, sugar, rice and other products of this country.

THE Secretary of War says the disturbance on the Texan border has not the semblance of a National trouble. He looks upon it as a purely local question, incident to the locality and imperfect civilization of the people living on the border. Troops have been ordered to the scene of disturbance, and will restore peace without trespassing upon Mexican territory.

THE financial troubles among the fine stock breeders of the Kentucky blue grass region are becoming widespread. The difficulty began some time ago with the failure of B. Groom & Son, with liabilities at over \$300,000. The custom among stock men of becoming sureties has complicated matters to such an extent that nearly all the leading firms are involved.

THE suit of the San Pablo and Tulare R. R. Co., vs. L. L. Robinson for condemnation of the right of way over the New York ranch has been decided. Judge Dwinelle instructed the jury that the plaintiff had the power to exercise the right of eminent domain, and that the uses to which the property was sought to be condemned were public uses. In the verdict there were 19 findings, the first affirming that the lands were necessary to the construction of the railroad, and the remainder assessing the damages, all which collectively amount to \$24,257.45.

It is proposed to increase the British army. The Los Angeles Herald estimates the area in that county sown with wheat this season at 20,000 acres.

JAMES T. FARLEY has been elected Senator from California. Hon. M. M. Estee received the complimentary votes of the Republicans.

MINING ground along the Comstock range is being pretty closely looked after at present and new locations are being recorded almost every day.

THE Cosmopolitan Dime savings bank has collapsed. The aggregate loss is not large, but the depositors are from the poorer classes and the blow is therefore very heavy.

THE Porte has instructed its Minister at Rome to ask for an explanation of the relations, which are growing more and more intimate, between Italy and Greece.

### Mining Share Market.

There has been nothing of special interest in the stock market during the week, and business appears to be slackening off as the holidays approach. The annual meeting of the Opbir company was held on Thursday afternoon, the usual reports were read and accepted. That of President Weller speaks hopefully of the future, stating that the mine is free of debt and has even \$30,000 on hand in coin and bullion.

The meeting proceeded to the election of officers for the ensuing year. The old board, with the substitution of A. K. P. Harmon for John P. Jackson, was re-elected.

The principal item of interest in stock circles is the Justice investigation. In this connection the Gold Hill News says: The Justice investigating committee have completed the first instalment of their labors at the mine, and have gone back to San Francisco to investigate Schultz some more, and put this and that together. They feel sure that they have unearthed a vast amount of high grade rascality, and find that the company will still be over \$350,000 in debt after the present delinquent assessment is fully paid in. Schultz says the new management have not acted in good faith with him; that they have brought charges which they cannot sustain, and anyhow will not look so dreadfully bad when properly and fully explained. The report of the committee will be made public in due time, and then the full and complete explanation of Mr. Schultz will be in order. Meanwhile, Superintendent Curtis is going ahead with the working of the mine, as he thinks ought to be done, and he does know as much as anybody about such matters. Justice will come out on her own bottom hereafter, although there may be another assessment required to clean up the indebtedness.

CONCLUDED.—We conclude this week Mr. Bowie's excellent article on Hydraulic Mining. The tables which appeared last week, with those given in this issue are exceptionally valuable to all interested in this kind of mining, and will repay careful perusal. Those in this issue particularly afford a fair basis for comparison, since they show the results in detail where the gravel is comparatively poor and the fall slight. Mr. Bowie's treatise is the most exhaustive on the subject and has been conscientiously and carefully handled, he having brought together a large number of valuable facts from his own experience and that of others familiar with the subject. We are glad to have been able to have presented so interesting a series of articles to our readers.

WATER RIGHTS.—Assemblyman Swift has introduced an Act to amend the Civil Code with respect to water rights. It is intended by the author to put a stop to the speculative appropriation of water. It provides that water may be appropriated for municipal, agricultural, mining and manufacturing purposes, but water for municipal purposes can only be appropriated by the city or town when it is to be used for the public use. Water for agricultural purposes may be appropriated for the use of a district by the land-owners of a district for the common use of all, or it may be appropriated by any land-owner or land-owners for the use of the land they own. The same rule applies to mines as manufacturing. No person can appropriate water to sell or speculate in it, unless he puts it to some beneficial use and when that is done his right ends. Water once brought upon land becomes attached to it and cannot be used away from it, but any sale of the land carries the water with it.

THE FLOUR PATENTS.—In the case of Cochran et al. vs. Deever et al. from the Supreme Court of the District of Columbia, the United States Supreme Court rendered a decision, denying the motion to set aside the decree and dismiss the bill. This is known as the patent process flour case, and it was charged that there had been collusion between the parties prior to the hearing and to such extent as would be taken notice of as affecting the decree. The Court failed to find any evidence of collusion, but it said that, under the circumstances, third parties who had no opportunity of being heard and whose interests, as opposed to the Cochran patents, are very important, should not be excluded from moving for a further hearing whenever a future case may be presented for consideration.

### Lady Bryan.

The annual meeting of the Lady Bryan mining company was held on Tuesday. There were six stockholders present, but with their own, and the proxies they held, shares to the amount of \$52,890 were represented, \$32,695 of the new issue and the balance of the old stock. Martin Jones was in the chair. A resolution commending the action of the stockholders in diminishing the capital stock of the company since the last annual meeting was passed. A written protest was handed in by certain dissatisfied stockholders against the holding of the meeting, on the ground that the Secretary and others were voting by proxy in the name of stockholders from whom proxies had not been obtained, and that there are no shares of stock out except those enjoined by civil process of the courts. The Chairman directed the Secretary to note on the protest that the parties presenting it do not represent one dollar's worth of stock according to the books of the company. Trustees for the ensuing year were elected as follows: C. R. Merrill, James A. Baker, Martin Jones, John Van Orden and L. I. Mowry. An amendment to the by-laws was then passed, giving power to the Directors to sell stock that may come into their hands by delinquencies of assessment, or any other way, without reference to the stockholders.

BULLION SHIPMENTS.—Since our last issue shipments of bullion from the prominent mines have been as follows: Tybo Con., Dec. 10th, \$4,039.89; Alps, 14th, \$1,822; Gila, 10th, \$7,061; Arizona, Dec. 13th, \$918.81; California, 12th, \$192,222.52; Con. Virginia, 15th, \$161,866.49; Northern Belle, 12th, \$3,429.36; Edwinton, 17th, \$2,259.08; Tybo, 12th, \$4,083.56; Grand Prize, 17th, \$267; Martin White, 17th, \$20,166; Manhattan, 18th, \$3,400; Northern Belle, 15th, \$5,150.67; Arizona, 17th, \$1,265.52; Leopard, 18th, \$4,300; Alps, 19th, \$1,531.

SENATE concurrent resolution No. 43, providing for a general State election on the question of Chinese immigration has been amended to read "general or special election" and adopted by the Assembly.

THE telegraph informs us that the Nevada quicksilver works at Steamboat Springs are proving a success. The first shipment of 20 flasks was made this week.

They have found petroleum in the Black hills said to be superior to that of West Virginia.

## OUR AGENTS.

Our friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send one but worthy men.

J. L. THARP—San Francisco.  
B. W. CROWELL—California.  
A. C. KNOX—Pacific Coast.  
C. N. WEST—Santa Cruz, Monterey and San Benito counties.  
A. C. CHAMBER—Tulare, Fresno and Inyo counties.  
JOSEPH DIMMICK—Mendocino, Humboldt and Del Norte counties, and Oregon.  
W. D. WHITE—San Bernardino and Los Angeles counties.  
J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.  
B. E. LLOYD—Alameda, Contra Costa and Napa counties.  
E. M. DENNY, Oregon.  
F. B. ALDERSON, Nevada.  
H. E. HALL—San Joaquin, Yolo, Yuba, Sutter and Colusa counties.

## TO QUERISTS.

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, all free to parties who address this office on matters of more interest to themselves than to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

Any person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinued.

## TWENTY-FIFTH YEAR—1878.

## Hall's Journal of Health.

## Contents of a Single Number:

The Little Courtesies of Life; Coughing in Consumption; Influence of Christianity on Medical Science; Ignorance and Ill Health; Rage and Ruin; Kindness the Best Punishment; Grass in Rum; Valuable Table; Incurable Insanity; Consumption—A Suggestion; The Spirit Rapper; Premium on Babies; Our Proverbs; Wrecked Clergymen; Marrying Well; The Lifting Cure; Sea Sickness; Face Painting; A Filthy Atmosphere; The Latest Crazy Man; A Suggestion; The Erie Railway; Sick Children.

Published in New York. E. H. GIBBS, M. D., Editor.

This journal has maintained the highest record of any health journal issued in the English language. It is not the amount of matter published which makes it the most valuable journal, but the plain and condensed truths it furnishes concerning that which is of ever vital importance to its large list of readers.

Annual subscription (post-paid).....\$1.50.  
To subscribers of this paper.....75 cents.

Address: DEWEY & CO.,  
No. 202 Sansome Street, San Francisco,  
Agents on the Pacific Coast.

UNITED STATES  
Mineral Land Laws, Revised Statutes,  
AND INSTRUCTIONS AND FORMS  
UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,  
Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

## A JOB PRESS WANTED.

Any printer having an Eighth or Quarter Medium Job Press for sale, will please address J. P., care of Dewey & Co., S. F. State condition and lowest price.

REGISTER YOUR  
TRADE

## MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks. Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks. We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

DEWEY & CO., Patent Solicitors,  
No. 202 Sansome Street, S. F.

A. T. DEWEY,  
W. B. EWER.

JNO. L. BOONE,  
GEO. H. STRONG.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly.  
The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding.

It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from this office for 50 cents, postpaid. Wholesale and retail agents wanted.

## To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

## PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where he principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY &amp; CO., Publishers.

Designing  
and  
Engraving  
at  
This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals, etc. We have a first-class

## Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY &amp; CO.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

**Advance Silver Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Monitor District, Alpine County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the twenty-first day of November, A. D. 1877, an assessment of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 16, No. 309 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the second day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the twenty-sixth day of January, 1878, at 2 P. M. to pay the delinquent assessment, together with costs of advertising and expenses of sale.

B. LINGLEY, Secy.  
Office, Room 16, No. 309 California St., San Francisco, Cal.

**California and Oregon Land Company.**—Location of principal place of business, San Francisco, Cal. Location of works, Jackson County, Oregon.

Notice.—There is delinquent upon the following described stock, on account of assessment No. 1, levied on the seventeenth day of October, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

Names	No. Certificates	No. Shares	Am't.
Allen, J. O., Administrator Estate of Isaac Allen	08	500	\$175 00
Belcher, W. C.	48	500	175 00
Belcher, W. C.	49	500	175 00
Belcher, W. C.	50	500	175 00
Clark, J. W., Trustee	125	1000	350 00

And in accordance with law, and an order of the Board of Directors, made on the seventeenth day of October, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Room 2, No. 415 California Street, San Francisco, California, on Monday the twenty-fourth day of December, 1877, at the hour of two o'clock P. M., of aid day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

J. W. CLARK, Secy.

**Manzanita Gold Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Sulphur Creek, Colusa County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the third day of December, 1877, an assessment, (No. 1.) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 51 Fremont Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the eighth day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before will be sold on Thursday, the thirty-first day of January, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, GEO. S. SPRATT, Secy.

Office, 51 Fremont Street, San Francisco, Cal.

**New Basel Consolidated Gravel Mining Co.**—Principal place of business, San Francisco, Cal. Location of works, Placer County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the tenth day of November, 1877, an assessment of seven and one-half (7 1/2) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 610 Merchant Street.

Any stock upon which this assessment shall remain unpaid on the twenty-eighth day of December, 1877, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the fourth day of January, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. D. F. LEGAYE, Secy.

Office, 610 Merchant Street, San Francisco, Cal.

**Summit Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the tenth day of December, 1877, an assessment (No. 1.) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 415 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the twenty-first day of January, A. D. 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the twenty-sixth day of February, A. D. 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, J. W. CLARK, Secy.

Office, Room 2, No. 415 California Street, San Francisco, Cal.

**Timmy Chub Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Cornet Mining District, Los Angeles County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the fourth day of December, 1877, an assessment, (No. 1.) of fifty cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 25, Nevada Block, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fourth day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-first day of January, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, G. C. PRATT, Secy.

Office, Room 25, Nevada Block, San Francisco, Cal.

**The Welch Consolidated Quicksilver Mining Co.**—Principal place of business, San Francisco, Cal. Location of works, Mount Diablo Mining District, Contra Costa County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the fifth day of December, 1877, an assessment, (No. 1.) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 7, No. 420 Montgomery Street.

Any stock upon which this assessment shall remain unpaid on the seventh day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-first day of January, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

J. F. FORBES, Secy.

Office, Room 7, No. 420 Montgomery St., San Francisco, Cal.

## Attention, Mining Companies.

### RICKARD'S PATENT

### Oxidizing and Chloridizing

### FURNACE,

FOR ROASTING

### COPPER, SILVER & OTHER ORES

Prior to Leaching or Amalgamation.

The most striking advantages which it offers above all other recent inventions of this nature may be briefly summed up as follows:

First.—Its cheapness, the cost of its erection (ex-royalty and freight) not exceeding \$1,500, for a capacity to roast and chloridize twenty tons per day, viz: brick work, \$1,000, and iron work, including blower, \$500.

Second.—Short time required for erection, viz: 14 days, after providing all materials, with a sufficiency of labor.

Third.—No expensive, heavy or complicated machinery being necessary, involving heavy freight to the district where it may be required. Brick and clay generally obtainable on the spot, being the chief materials required in its construction.

Fourth.—No skilled labor or technical experience is necessary to work it. Two ordinary laborers being sufficient to attend to it when in full operation.

Fifth.—It does not easily get out of order, and is readily repaired by an ordinary mason or blacksmith when it does.

Sixth.—The royalty, or license to use it, is exceedingly moderate, removing thereby all temptation to evade or infringe the patent.

Seventh.—Calculating labor at \$3 per day, and wood at \$6 per cord, the cost of roasting is but little over \$1.50 per ton (ex-salt when chloridized), at these high California rates for labor and fuel.

One of them is now in the course of erection by the Aztec Gold and Silver Mining Company, at their mill in the Aztec District, Santa Rita mountains, Southern Arizona. At their office, 302 Montgomery Street, rooms 14 and 15, a model may be seen, and working drawings, with all further information necessary to enable any ordinary mason to construct the furnace, may be obtained from

COL. J. D. GRAHAM.

pamphlets, with illustrations and full description, sent on application.

(Room 10.)

### THE O'HARRA

### CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:

One man.....	\$ 4 00
One ton.....	5 00
Wood—2½ cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00

Cost of 20 tons.....	\$52 25
Cost of one ton.....	2 61½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con solidated Co.'s mines, in Peavine District, Nev., and at the Eschequer mill, Alpine Co., Cal. For further information, apply to

D. J. O'HARRA,  
Reno, Nevada.

**FRED'K OGDEN, Sole Owner Tulloch Patent,**  
ROOM 72, NEVADA BLOCK.

Extract from a letter from C. G. Rodgers, Superintendent Green Mountain Mining Co., Plumas County, September 10th, 1877: After using both the Tulloch and Hendy Ore Feeders, side by side, for eight months, I can candidly say, that in my opinion, the Tulloch is much the best machine; it will feed any ore that can be fed by machinery; there is nothing about it to wear out, and should anything break, any blacksmith can repair it. Whereas, the Hendy machine is wearing from the moment it is started, and when any thing is worn out, or broken, you must have a machine shop or foundry to make the repairs. The Hendy Feeders are not in use at the Gold Stripe Mill; they were thrown out after a fair trial of some two weeks.

**San Francisco Cordage Company.**  
Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes: Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

**TUBES & CO.,**

**LUMBER and LOG-BOOK.**  
OVER HALF A MILLION SOLD.

Most complete book of its kind ever published. Gives correct measurement of all kinds of lumber, logs and plank by Doyle's rule, cubical contents of square and round timber, stave and heading bolt tables, wages, rent, board, capacity of cisterns, cord-wood tables, interest, etc. Standard book throughout United States and Canada. Ask your bookseller for it, or I will send one for 35 cents, post-paid. G. W. FISHER, P. O. Box 235, Rochester, N. Y.

SOLD ON THE PACIFIC COAST BY

**DEWEY & CO., San Francisco.**

And mailed post-paid on receipt of 35 cents in currency or postage stamps.

## \$1,000 Challenge Ore Feeder.

### HENDY'S \$1,000 CHALLENGE ORE FEEDER.

I call my Automatic Ore Feeder the \$1,000 Challenge, because I challenge the owners or backers of any other feeder to a competitive test for that amount. As Mr. C. G. Rodgers, Superintendent of the Green Mountain mine, near Greenville, Plumas county, appears prominently as a detractor of the merits of my feeder, and seems confident that another one is better, perhaps he will accept this long-standing challenge which the owners of other patents will not, and give me an opportunity to prove publicly the superiority of my machine. As to Mr. Rodgers' assertion about my feeder wearing out, it is no less fallible in that respect than other machinery; but I have over 250 now in use, some of them for over two years, and have never had to expend 25 cents for repairs. The fact that my feeder received the premium at the late Mechanics' fair, and that I am shipping several feeders weekly to different parts of the country, is sufficient proof of the appreciation in which it is held.

As to my feeders having been thrown out of the Gold Stripe mill, they were not displaced for inefficiency, as the following letter will show, and it answers also as a complete refutation of Mr. Rodgers' statement:

OFFICE SUPERINTENDENT OF THE GOLD STRIPE G. M. CO., }

JOSHUA HENDY, Esq.—Dear Sir:—Your favor of the 15th instant at hand. In reply to your inquiry as to the working of your ore feeders at our mill, we can say that there is no fault in the machines, and we consider them the best now in use. At present they are not in use with us, owing to the construction of the mill, which we are about to rebuild and make proper arrangements for putting in your feeders.

J. K. OWEN,  
Superintendent Gold Stripe Mine.

One of the principal owners of the Gold Stripe and Green Mountain mills is also largely interested in the Plumas National mine, where I have just shipped several feeders, showing the confidence placed in the machine by these gentlemen who have used it.

Now, if Mr. Rodgers is sincere in his belief as to the merits of a rival machine over mine, here is a chance for him to make a thousand dollars easily, if he can get the owners of the machine to lend him one for the trial, which is the only doubtful point in connection with the matter. Mr. Rodgers' eight months' experience with both machines ought to give him confidence enough in his own convictions to accept the challenge offered to him, or any one else.

JOSHUA HENDY.

Corner Fremont and Market Streets, San Francisco.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other the market, and will sell them as cheap as any other of its class.

Mining and Scientific  
Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free.

Address,  
DEWEY & CO.,  
202 Sansome St., N. E. Cor. Pine,  
San Francisco.

Thanks for Six Patents, Etc.

SACRAMENTO CITY, November 23, 1877.

MESSRS. DEWEY & Co.—Dear Sir:—Please accept my thanks for the prompt and successful manner with which you have conducted my business in obtaining patents for fire brick, and for a smelting and condensing furnace, making six patents I have obtained through your patent agency. Four of the above patents were for the purpose of saving fine gold, quicksilver and amalgam, and the concentration of ores of all kinds. I can cheerfully recommend the firm to all with whom I may come in contact, especially inventors. I remain, respectfully yours,  
GEO. R. EVANS.

THE BEST FILEHOLDER.—After having used Dewey's patent elastic hinge fileholder for over a year past, the *News* cheerfully indorses it as the best newspaper fileholder in existence, possessing important advantages over any and all others in use. The holders are neat, light and convenient, and the newspapers are placed in them with the utmost facility and least possible time and exertion. They are the simplest, bandiest and cheapest of all. Anybody keeping files of papers in reading rooms, offices or at home, should send at once to the proprietor, A. T. Dewey, San Francisco, and get the only proper fileholder. Samples by mail fifty cents.—*Gold Hill News*.

SAN LORENZO, December 6th, 1877.

MESSRS. DEWEY & Co.—Gentlemen: I received the Letters Patent for my invention on the 5th inst., and beg to thank you for the gentlemanly and business-like manner in which you have dealt with me from the beginning of my application. I shall always feel it a pleasure to recommend you to all I come in contact with who need Letters Patent. Respectfully,  
WM. DALE.

Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the HAMPDEN WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

DEWEY & JORDAN, Agents,  
433 Montgomery St., S. F.

SUMMER QUEEN AND FAIRY QUEEN  
COAL  
OIL STOVES.

The best in the World.

{ Sansome St }

PACIFIC MAIL STEAMSHIP CO.

The Company's Steamers will sail as follows, at 12 M.:  
ALASKA.....JANUARY 1.  
For YOKOHAMA and HONGKONG.

GEORGIA.....DECEMBER 31.  
For PANAMA and NEW YORK, calling at Acapulco, San Jose de Guatemala, La Libertad and Punta Arenas. Tickets to and from Europe by any line for sale at the lowest rates.

ZEALANDIA, MONDAY, DECEMBER 31, at 12 o'clock, noon, or on arrival of the English Mails, for HONOLULU, AUCKLAND and SYDNEY.  
\$10 additional is charged for passage in Upper Saloon.

DAKOTA.....DECEMBER 20.  
For Victoria, Port Townsend, Seattle, and Tacoma, connecting at Tacoma with Northern Pacific Railroad for Portland, Oregon.  
Tickets must be purchased before 11 A. M. on day of sailing.  
For freight or passage apply at the office corner First and Brannan streets.  
WILLIAMS, BLANCHARD & CO., Agts.

N. W. SPAULDING'S

PATENT DETACHABLE TOOTH SAWS,  
Manufactory, 17 & 19 Fremont St., S. F.

Smelter and Refiner.

A competent person is desirous of receiving the position of Superintendent of a Smelting and Refining Works. Can give satisfactory reference for ability to smelt all lead ores, refine silver and make market lead. No objections to go to the Territories. Address P. F. M., this office.

504 Washington St.,  
SAN FRANCISCO.

## The New Year.

With bright face and strong heart the Californian greets the coming year. To many it comes as the breaking of a glad dawn to weary and despondent watchers. It promises a respite from enforced self-denial and deprivation. In the black storms, the moaning of winds from southward quarters and the copiously descending floods, hope has given birth to anticipation, and mouths of plenty seem assured. These are tokens of a revival of material prosperity, an awakening of trade, a confidence of investment, a fullness of production and all the dissemination of comforts which these carry in their train.

It is said that it is easy to do well in prosperous times, and, in prosperity's promise, similar case of well-doing may be enjoyed; by those, at least, who have hopeful hearts. It is also common to look upon the advent of the New Year as the season for salutary resolutions. Therefore the season is commended to all who feel strong within them the impulse toward better lives and more consistent actions. What though some resolutions fail of maintenance; what though some of the "new leaves," which are each year turned, fly back again to the heavier side of the volume. It is certainly better to resolve and fail than never to resolve at all. So far as these words apply to matters of personal actions and the methods of individual lives, we commend them to each of our readers for individual application.

In a wider circle, the old year teaches the imperative necessity which now exists, that all good citizens should arise to their duty in public affairs. Although we do not believe all that is said about the need of arraying one class against another for the general welfare of the State, and although we most abhor the ranting, roaring demagoguism which is rife, we are still well aware of the duty which the industrial classes owe to themselves in the issues which are now being made. It is true that the welfare of the many is too far given over to the hands of the few. This unfortunate condition of affairs extends from great things to small, and the and spirit of it is to secure personal aggrandizement, not by legitimate production and earnings, but by partial laws, by artifice and by fraud. The spirit is the same whether it operates by building up an oppressive monopoly under the guise of a national blessing; whether it creep into a legislature and frame a law which throws the burden of taxation where, in justice it does not belong; whether in the glitter of gilding, it builds a fraudulent bank, for whether, in the seclusion of a cellar, it grinds beans into coffee, mixes fine sand with garden seeds, or fills hutter firkins with tallow. All these public evils vary in degree but are the same in kind. They are all outrages upon the man who honestly labors and is privileged to demand protection from the State for his industry and its results. They all receive our unqualified hate and the full force of our journal is devoted to combatting them and aiding the people in bringing them to light and overthrow. As the New Year comes we resolve for ourselves, and we urge all our readers to similar resolution, to do all in our power to understand these wrongs and their remedies and to fearlessly declare them. We do not lose faith in human nature, no matter what evil is shown forth in the wicked plotting of a few; rather would we call out this manhood in which we trust to meet the vile schemes which are laid to oppress and defraud it. How can this be done? The remedy has been proposed a thousand times. Each citizen must rise to his duty to himself and to the State to see that he is not defrauded by the aid or through the negligence of those who represent him in law-making bodies. It is timely to make remarks like these. Our Legislature has just begun its session, and all should study the measures which are brought before it and should freely aid the people's representatives with their knowledge and suggestions on the special subjects which arise. These will doubtless be stirring and important and need the wisdom of all right-minded men for their true adjustment. Then will come the constitutional convention which will amend the organic instrument which will be the foundation of all

our laws. Let every honest vote be rightly placed in the selection of wise and upright men to discharge this most important public trust. Thus the coming year is charged with duties for each citizen of our State. For this reason we urge upon all our readers the resolution to arise to earnest, independent thought on public matters. This is the price of the success and perpetuity of our democratic institutions. Upon this depends the safety of our homes and the welfare of our children. Standing now upon the threshold of the year who will enter without resolving that the year shall not pass without his making every effort within his power for the attainment of the measures and safeguards which the public well-being demands.

That the coming year will be one of gratifying growth to our State and the coast in general; that in our homes, in a thousand hills and valleys there will be peace and prosperity; that

THE NEW VICTOR ORE FEEDER.

the delight of living in this favored land will be hallowed by the higher joy of living aright—all these we sincerely hope. And coming at last to the circle of our friends who extend their hands to receive the hearty greeting of the PRESS, our earnest wish is for A HAPPY NEW YEAR to each and all.

**THE MINE LOCOMOTIVE.**—EDITORS PRESS:—Among the articles in the MINING AND SCIENTIFIC PRESS which have excited interest here, is the one in your issue of December 15th, on "Mine Locomotives for Gold Mines." Several of your readers on the Comstock lode have expressed a desire to hear more on this subject, and also to learn more of the details of construction of the cars used, which desire you perhaps may be able to satisfy. Mr. Bowie's articles on hydraulic mining have been remarkably good.—H., Nevada, Dec., 1877. [We shall endeavor shortly to comply with the request of our correspondent.—EDS. PRESS.]

OVER \$8,000,000 was raised by 51 Bible, missionary and educational societies during the past year.

## The Victor Ore Feeder.

The accompanying engraving shows the Victor Ore Feeder, which is being introduced to the mining public by E. T. Steen, agent, 226 and 232 Beale street, in this city. It was patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by J. Tulloch, in August of last year. The invention is the result of experience and experiment. The feed is positive and not by friction.

The Victor machine is so arranged that by the dropping of the stamp the ore is pushed forward as fast as required to supply the battery. The feed is regulated at the rear end by a simple device not shown in the engraving. This feeder is fitted with rollers for moving. It is

## Cheap Fares.

The fact that the Legislature has passed a law regulating the price of a single fare on the street railroads at five cents, is probably more important to the mass of the citizens of San Francisco than the question of choice of an United States Senator. Though apparently a small thing to grumble about, the six and a quarter cent fares, so long in vogue on the street railroads, has been burdensome. The railroad companies have been tenacious in keeping the fares at that figure, as it has given them considerable increase in revenue in more ways than are at first apparent. In the first place, of course, they only give four tickets for 25 cents, instead of five as they will have to do under the new law. But this has been perhaps of even less importance than the fact they got 10 cents for a single fare if coin were offered and change demanded, or if a 10-cent piece was paid instead of a ticket. Our system of coinage not admitting of taking six and a quarter cents from a quarter unless tickets were given instead of coin change, the passenger had to pay for a ride and a half instead of one ride when he handed the conductor a 10-cent piece.

We have, however, a five-cent piece, the smallest coin in use among us, and under the new law it will constitute a legal fare and the railroad companies cannot swindle the passengers out of three and three-quarter cents any longer. The only strange thing is that this swindle should have been tolerated so long as it has. A man would generally rather throw into the street a half dollar than to feel that he has been swindled out of three cents; and many persons have steadily refused to ride in the street cars on principle, rather than to submit to the extortion. Our street car lines are well patronized as it is, and ought to pay well without resorting to any petty extortions to increase their revenues.

To the humbler class of citizens residing in the suburbs, as most of our workmen do, this change to five-cent fares will be very welcome. It will not now matter to them whether they have tickets or coin when they get on a street car, as it costs them no more in either case, and we have no doubt that the measure will in the long run be to the benefit of the railroad companies as well as the passengers.

The old extravagant habits in vogue in the early days of California will not do any longer, and one by one the little impositions of companies and tradesmen, which have been so long submitted to, must give way to a changed style of living. The old 12½ cent and 6¼ cent swindles will soon be things of the past, although we still pay 15 cents for articles marked 12½ cents oftener than we ought to. The difficulty of making exact change is taken advantage of to charge 15 cents for things worth only 10 cents. For instance, the fare to Oakland on the ferries is the same as it has been for years, 15 cents, when 10 cents would be ample. Oakland, Alameda, Berkeley and vicinity now contain more than twice as many inhabitants as they did a few years since, and the travel by ferry has increased proportionately. The cost of operating the ferries is no more now than then, although the revenues must have been largely increased. Still, a single fare is 15 cents each way, although on Sundays in summer a ticket to go and return to Oakland is sold for 25 cents. When the price for single fare is reduced to 10 cents it will be very much better than now, for on Sundays and holidays our workmen delight to get a sight at grass and trees and breathe the fresh air on the bay, provided they can do so at a reasonable cost. We hope this change will soon occur and that before many years the fare will be even lower, so that it will cost no more to cross the bay than to go to the Mission.

A. H. STEPHENS, Chairman of the House committee on coinage, weight and measures, is at work on an exhaustive report, which he will make to the House soon after the holiday recess, in favor of making the metric system obligatory in all Government transactions.

JAMES HURLEY, a young man employed as carman in the Deer creek tunnel, Nevada City, was struck by falling rocks from the roof of the tunnel Tuesday morning, and received injuries which are likely to prove fatal.

## Trees and Rainfall.

No. 6.

[Written for the Press by SAMUEL PURNELL.]

## Why Trees Produce Rain.

The reader who has followed us thus far will have noticed that we have continually claimed that the destruction of the trees induces dryness and the planting of forests produces rain. The proof of both these statements is ample. As an example of the former it may be stated that 50 Communes of the French Alps are reported absolutely desolated in consequence of the felling of the forests. As an example of the latter, it is said that the rainfall in lower Egypt has increased from nine to sixteen inches because of the culture of trees. In South America when the forests surrounding the valley of Aragua were cleared the lake fell, and it rose when they were suffered to grow again. The Lake of Fuquene fell to one-fourth its former size when the neighboring mountains were stripped of their wood. The fact that trees do actually produce rain being unimpeachable, it may now be interesting to attempt to show why they do so.

A large part of the rain that falls upon a forest sooner or later percolates through the superficial strata, finds its way to the soil around the roots of the trees, and is conveyed to some distance by lateral infiltration. The soil of the forest being thus always moist, the water in great part is absorbed by the roots of the trees, and by the vital force is carried up the trunk, out into the small branches, and in thin layers is spread over the surfaces of the leaves. The leaves of a tree perform a service analogous to those performed by the lungs of a human being. The leafy lungs exhale and evaporate their moisture and discharge it into the atmosphere. This action is sustained as long as more water finds its way to the roots than the trees itself consumes. The amount of water so discharged into the air is not definitely known, and has been reported differently by several observers; but it seems probable that it amounts to at least one-third of the annual rainfall. In the course of a season a large tree will expose a couple of acres of foliage, and each leaf is busily at work as an evaporator. The dryer the surrounding air, the more readily does a wet-leaved tree breathe out its moisture. Grasses and shrubs, like trees, are also engaged in evaporation; and from the immense number of grass rootlets in a moist country, it is safe to assume that upon the whole they exhale as much moisture as the trees. It will be seen that an amount of moisture equal to one-third the annual rainfall being slowly and continuously introduced into the atmosphere must, in the case of larger forests, have an appreciable effect upon the increase of rain, for, if conditions are favorable, it will generally be reprecipitated in the vicinity of the trees that exhaled it, and give rise to local rains.

Trees also produce rain by keeping the ground beneath them shaded, moist and cool. Then as the moist winds blow over the ground they are cooled below the dew-point, and rain is precipitated. The temperature of the tree itself is about 54° F., is almost invariably below that of the summer winds and thus maintains a refrigerating and rain-producing influence.

The mere presence of a forest tends to mechanically produce rain by hindering the course of the winds and entangling the vapors. The small particles of moisture in the air are in a highly expanded and diffused state, and do not combine easily while they have free motion. By interrupting their course by trees the vapors are given a spiral and centripetal motion, causing the cohesion of the fine globules of vapor into a mass large enough to fall as a drop of rain.

Trees may be said to produce rain by still

## Another Method.

The electro-dynamic power of the sun causes moisture to rise from the oceans and saturate the surrounding atmosphere. The invisible watery vapors are in electric repulsion, and are driven asunder in consequence of being in a highly constrained electrostatic state. As long as this continues they cannot unite; their electrical tension must first be destroyed. In most cases the discharges necessary to accomplish this take place silently and invisibly, at other times with much noisy thunder and flashing lightning. In either case, the tension being neutralized, the vapors combine and the globules form drops of water which, other necessary conditions being present, will fall as rain. These reactions probably always take place during a rainfall. The electricity of the vapory cloud can only be discharged by coming in contact with a body charged with the opposite electricity; this may be another cloud, the surface of the earth or trees. Of all of these the latter is the most common and efficient discharger, especially during summer. The potential of a tree, to its topmost leaves, is at zero, and it is in the exact condition to neutralize the electricity of atmospheric aqueous vapor, and in this it performs the same service as a stroke of lightning, though the discharges are silent. The electricity of the cloud being discharged, the globules of vapor are at liberty to unite and finally cohere into drops of sufficient size and weight to fall to the ground as rain. That this is the actual order of events with most rain drops can scarcely be doubted. As before re-

marked, trees are not needed to secure at least a small amount of winter rains in California; the rain then falls from the warm and moist winds often by reason of mere refrigeration and disengagement of electricity; the vapors striking the cooler ground partially condense upon it, and, moistening the soil, a good conductor is formed at once for the neutralization of the electric waves, which action continues till the cloud is exhausted. This cannot be the case here in summer, for the naked soil is hotter than the ocean wind, the vapors are still more expanded upon passing over it, and the dry earth being an insulator, no precipitation can begin and no rain can fall. Reverse this condition; let a rain-cloud pass over a forest, its constrained electric condition will be destroyed, the repelled vapors will cohere and rain will fall in the vicinity. For the purpose of placing a zero potential in the atmosphere it is plain that a tree bearing a wet leaf and full of sap is preferable to one hearing a leaf comparatively dry or gummy; and is also preferable because its leaves remain cooler as it transpires more moisture. The eucalyptus, which is a favorite here on account of its rapid growth and reputed salubrity, is not as good a rain tree as some of the soft wood trees are, such as the beach, birch, pine and maple, the latter especially carrying much water.

Suppose the entire

## Mountains of the Coast Range

Were covered with forests of wet-leaved trees, we would be so fortunate as to secure summer rains from the trade wind. This wind blowing with an ocean current of low temperature, and possessing relatively but little humidity, instead of as now touching a coast much warmer than itself and having its relative humidity so lowered as to render it impossible to drop its moisture, would then impinge upon the cool mountain forests of the Coast range, its relative humidity would be raised, at favorable times its electricity would be discharged, its vapor particles assume the spiral and centripetal motion, its temperature fall below its dew point, and abundant summer rains would fall upon the coast and the interior valleys.

Did space permit, the writer would like to mention many cognate subjects, but this paper is already too long, and it would require a large volume to state the case fully. The interested reader can fill in the blanks himself; he will not lack for material.

## Among the Omitted Matters

Are statements of the waste and destruction of timber upon the Coast range and the Sierras; the recovery of Nevada, western Arizona, and the Colorado and Mohave deserts; the laws of some of the nations of Asia and Europe upon the preservation and cultivation of trees; the increased productivity of the State, consequent upon summer rains, and its increased beauty and healthfulness; the probability of development of a nobler type of man; the absolute impossibility of any considerable area being irrigated, and the time and cost of general irrigation, being insuperable difficulties in the way of the same; the uncertainty of flow and the expense of artesian wells; the use of grass in nature, and its relation to trees and rain; the solvent power of living roots, and their value as tie to prevent erosion; the cause of hail storms and how forests prevent them; why California contains so few wild birds; why the prairie States were devastated by locusts or grasshoppers, and the relation of that scourge to trees and rain; the proper proportion of forest to cleared land, showing that while in Europe generally and the Atlantic States 25% of woodland is ample, France requires one-third of her area in forests, and California requires at least two-thirds of her coast wooded, and half of the Sierras and the valleys; the progress made in France, Germany, Austria, Russia and Egypt in silviculture, and the increasing success of the efforts; the superiority of cultivated timber to that of spontaneous growth; the proper measures to be taken to direct public sentiment to tree planting, to make it to the interest of landed proprietors to maintain forests; the annual income of forests; the chemical work of a forest, the effect of ozonized oxygen, and the protection offered against malaria, cholera, and infectious diseases; the hygroscopicity of naked and of wooded soil; the influence of forests in checking storms, preventing frosts and cold and hot winds, such as the mistral, the terrible wind of France and the desiccating north wind of California; the growth and march of dunes, owing their destructive character to the ravages and improvidence of man; the hypothesis of a rising or falling coast, as regards a geological horizon, and its influence upon rainfall; why Indian corn and many other staple crops do not succeed well in California; why irrigating water does not stimulate and fertilize plants as much as falling rain; the proximity of most of the aqueous vapor in the air to the surface of the earth; the physical record of Mexico and Central America; the telluric forces now at work upon the Pacific coast. These are all interesting subjects, and may be fully presented at some future time, should there be any demand for such information.

## To Conclude

This series of articles it now only remains to say that as the scattered trees and remnants of forests are fast disappearing before the spoiler, and no forest trees are cultivated; as things are now progressing in California, in consequence of false ideas of the rights of property, the selfishness of the people, and the want of a correct public sentiment upon the subject of forests, the State must naturally and slowly become

drier and drier, the mountains more desolate and rugged, and the interior valleys more and more unfruitful and uninhabitable, till at last they shall in, sterility equal the great desert of Sahara, and the dwellers thereon meet the fate of the Aztecs and Mound Builders. Behold the approach of the desert, the crime against posterity! Would you avoid it? The present destructive course of nature can he reversed, summer rains made to fall, and the entire State be thus converted into an ever-fruitful and enchanting garden of health, happiness and plenty, simply and only by the universal planting and maintenance of TREES.

## Garland's Mine and Mill.

The editor of the Calaveras Chronicle recently made a visit to Garland's mine and mill in this county, and says: The mine is located in Tunnel ridge, about two and a half miles from Mokelumne Hill, on the Chible Gulch road. It comprises the ground embraced in the two locations formerly known as the Carpenter & Bailey and Green & Guy claims, having a front of over 1,000 feet and extending through the ridge. A great deal of money was taken out of the two claims mentioned by their former owners, the only drawback to the complete success of their working being the extreme hardness of the ground. The gravel is streaked with a species of cement that is so tenacious that the ordinary process of washing fails to extract the gold, and in some instances blasting has to be resorted to in mining the dirt. A tunnel 450 feet in length has been run since Mr. Garland purchased the ground, and it is still being extended. The face of the drift is yet in good looking gravel, showing that the channel or "pay streak" is a wide and extensive one. The tunnel is substantially timbered throughout, and is traversed by a line of railroad that does a lively business in the way of delivering gravel at the mill, returning with the timbers and other etc. required in the prosecution of extensive mining operations. Three "breasts" have been opened off the main tunnel, looking up the ridge, which will give abundant opportunity for the mining of gravel fast enough to keep the mill in constant operation. The gravel looks and prospects well, the mine, is opened in splendid shape for working to advantage and all the indications point to a permanently profitable enterprise.

The mill, a five-stamp battery, is a model of neatness, compactness and substantiality. Water is the motor. It is supplied by a 11-inch iron pipe, under a pressure of 250 feet, the power being applied through the medium of a hurdy-gurdy wheel of the latest and most approved pattern. The battery is so arranged that five additional stamps can be put on whenever required, the shafting being heavy enough and the power abundant to admit of doubling the present crushing capacity if desired. The mill is furnished with Cochran's patent cans and self-feeders, and in fact all its appointments are first-class, no expense having been spared in providing everything that can facilitate operations. Ninety tons of cement are put under the stamps in 24 hours, but 15 inches of water being required to run the mill.

Connected with the mine are a large boarding house, blacksmith shop, etc., and as a number of neat cottages have been built in the vicinity for the accommodation of miners with families, the place presents the appearance of a new and thrifty settlement. Twenty-five hands will find employment just as soon as development enough is made to admit of the working of a full force.

E. Jillson, Esq., an experienced mine and mill-man, is general superintendent of the enterprise, Mr. Richard Evans officiating as underground foreman. The mill was built under the supervision of Mr. John Rider, a mechanic whose work never fails to give satisfaction. Mr. Garland deserves success for his energy and perseverance in pushing forward an enterprise that involves some risk and a large expenditure, and we are glad to be able to say that the prospects of the mine are certainly extremely favorable.

## Turkey Creek, Arizona.

The Arizona Miner says: Mr. Masterson, the owner of the new mill that is now completed, which will commence operations this week, arrived in town on Monday. We learn from him that steam has been raised, and the whistle sounded, the stamps dropped, and all the machinery moved, clearly demonstrating that everything is complete about the concern to commence operations in earnest this week. Numerous valuable leads grace the hills surrounding this new ore reducer, and many tons of rich chlorides lay heaped upon the dumps at the various lodes, which will now be moved in and consigned to the pulverizing giants that have been placed in the rugged sierra by this enterprising gentleman. This mill, although of small capacity, is complete and substantial in every detail, and we imagine just what most of quartz kings need, for should it become necessary, as is many times the case, to remove the machinery to another location, it can much more readily be handled, and a small cost will cover the taking down, removing and re-erecting of the same, while the capacity is sufficient to satisfy the demands made upon most quartz mills, if kept running steadily, which is the intention of Mr. Masterson with his little Gem, that now stands in princely majesty, surrounded by a grand old forest, beneath whose earth lie

hidden the sparkling stones containing gold and silver.

The machinery is all from the Pacific iron works, San Francisco, and is of the latest and most improved pattern, and so accurately arranged and fitted that when the mechanics who superintended the erection of the mill pronounced the work finished, the stamps were dropped and the machinery put in motion, everything worked like a charm. The mill has a capacity of four tons per day, has a No. 60 screen, and each stamp weighs 850 pounds, the battery weighing one ton; the engine is of 25-horse power, and the battery is so arranged that in case the demands upon the mill from the many mines adjacent require a greater capacity, more stamps can be added with but little expense and trouble. It is claimed for this machinery that it is as durable and of as fine a finish as any that ever left the city of San Francisco, and is intended as a specimen whereby the hundreds of miners who own extensive mining interests may examine its merits, and if it accomplishes one-half what it is claimed it will, we doubt not but what hundreds of these bullion-producing agencies would be purchased and erected all over the mountains, as they are within the reach of every man who has a few tons of good ore. This little mill, with its formidable proportions, may be the means of causing a great revolution in the mining camps all over Arizona. The brick work for the boiler and other parts of the building was managed in a very satisfactory manner by Messrs. Longbottom & Joyner, the material being of a substantial character.

## The Mines of Como.

Now that capitalists are meeting with such excellent success, says the Enterprise, in the old and almost abandoned mining districts of Aurora and Bodie, we would suggest to them that we have a dead camp much nearer home that might pay well for revivification. This is the old Palmyra or Como mining district, in the first high range of mountains southeast of the town of Dayton.

The mines of that district were once highly valued and there was no little excitement in regard to them. The town of Como, situated in the midst of the mines, once boasted its church, schoolhouse, brewery and newspaper and promised to become a permanent and prosperous place, but hard times came on, prospecting ceased, the town went into the sere and yellow leaf and finally died, deserted by all its friends.

All the principal ledges of the district prospect well in gold and silver, particularly the latter, in the very croppings. Black sulphure of silver is to be seen in pieces of rock broken out of ledges at points above the surface, and, this being the case, it would seem that there should be something good somewhere below if properly sought for.

The shafts sunk there would here be called nothing more than a "starter," being but 100 or 200 feet in depth; yet when they had gone to that distance below the surface, the old time prospectors became discouraged because they did not cut into big deposits of the richest black sulphure ores.

The several rich veins cropping out on the surface are probably but the feeders of one grand lode, and it would doubtless be worth while for some good miner to take a look at the range in this light and with a view to sinking a proper shaft in such a position as would open up the mother vein.

In the early days, wherever a streak of quartz—a feeder—came to the surface, it was looked upon as being a lead by itself and was located and worked as such. Therefore, we find that there was a great number of holes, called shafts, sunk on these spurs and feeders, and thus the miners frittered away their time and money until the latter was no more and their patience was exhausted. They scratched over a great deal of surface, leaving the real vein untouched.

These feeders they located as so many distinct lodes, and each man or company dug away until starved out, none getting deeper than 200 feet below the surface. Directly through the old town of Como, as we may say, run feeders that were formerly known as the Aurora, Montezuma, Altamonte, Wagram, Goliath, Buckeye, Monte Cristo, Rappahannock, Orizaba and Rapidan mines, with half a dozen more that might be named. All the veins or feeders named above showed silver from the start and none of them were sunk upon to any depth worth naming; indeed, when more water came in than the miners could bail out with a windlass and bucket, they threw up the sponge.

The sulphurets in the croppings are of a very fine grain and should be very carefully worked; the pulp should most probably be treated much as we now treat slimes. For this reason the rock was not made to pay in the old-fashioned mills and by the rude processes in use in early days, even when excellent assays were obtained.

These old Como mines are certainly worth being looked after, and, viewed in the light that we have on mining at the present time, we have no doubt a shaft might be so located as to develop a grand main lode, running beneath and a little to the eastward of the principal veins and spurs sunk upon in the early days. The old Whitman, to the northward of the town of Como, is the largest of the veins seen on the surface and would probably be a good indication of the whereabouts of the mother lode of the district. It is a vein that prospects well in silver from the top down.

## MECHANICAL PROGRESS.

## Conversion of Steel.

Some weeks since we gave the method by which blister steel is manufactured. As we find these notes on the metals they use are quite acceptable to our readers in the machine shops, we give another paragraph on the conversion of blister steel into shear steel and cast steel. This subject was recently discussed by Mr. J. G. Fairweather before the Scotch Society of Mechanical Engineers, and we draw from his lecture the following descriptions:

In the conversion of blistered steel into tilted or shear steel several bars of blistered steel are bound together into a bundle which is raised to a welding heat in a forge and placed under the tilt-hammer. A few blows soon weld the bars together, when the hindling ring is knocked off, the bundle reheated in the forge and hammered until it is reduced to a rectangular bar of the required dimensions. Shear steel possesses a much more compact structure than the blister steel, and its tenacity and ductility have been much improved by the tilting. If double shear steel be required, the tilted bar is broken, and the two pieces welded into a single bar. Shear steel is commonly employed for tools, which are to possess considerable toughness without being extremely hard; but its deficient hardness prevents it from taking a very high polish or a very keen edge, so that it will not serve for making the finest qualities of cutlery. The best variety of steel used for these is made by melting the blister steel and casting it into ingots.

In the conversion of blister steel into cast steel, the blister steel is broken up into pieces of a convenient size for packing close together and about 30 pounds or more of it are introduced into a crucible about two feet high, made of fire clay mixed with black lead, and provided with a closely-fitting cover. Hard coke broken, into small pieces is employed for heating the crucibles; the steel is then introduced, the crucibles covered and the furnace filled up with coke. When the steel is melted, the crucible is withdrawn, and its contents poured into a rectangular or octagonal mold of cast iron, which has been previously heated and placed in a vertical position. The fusion of the materials in crucibles is the simplest and oldest mode of making steel, and it has been practiced by the Hindoos from a very remote period. In this process a small quantity of wrought iron, from one-half to two pounds either in one lump or cut into pieces, is charged into a crucible of baked clay along with 10% of dried wood, and luted over. When the luting is dry, a dozen or two of these crucibles are stacked together in the form of a dome; a fire is lighted inside of this dome, and the interstices filled with charcoal, which is also heaped over the top. The fire is urged by bellows, and in from 2½ to 4 hours the operation is completed. A new arch of crucibles is then constructed, and so the process goes on night and day. The resulting steel, called "wootz," is obtained on breaking open the crucibles, as melted cakes; which are reheated for several hours to a temperature slightly below their fusing point. They are afterwards drawn out under the hammer at a very low red heat, as the metal crumbles to pieces if an attempt is made to forge it at a high temperature.

**PROFIT LIES IN THE SHOP.**—Some years ago, says the *Railroad Gazette*, when building locomotives was a very profitable business, a gentleman who had acquired his training almost entirely in the commercial school abandoned his early occupation and embarked in the one referred to, which then promised to be more lucrative than his old business. True to the instincts and traditions of his early calling, the first thing he did was to open an elaborate system of accounts, so as to keep a correct record of the cost of everything and the receipts and disbursements of the business. Soon after being launched in his new career, another gentleman, who had had a number of years' experience in building locomotives, called on his new professional brother, who took some pains to show his visitor how skillfully he had organized his system of accounts, and dilated at considerable length on the fact that his prospects of doing a profitable business were good, because, he said, he would know exactly what everything would cost. "Well," his visitor replied, "if you can make money in the locomotive business by skillful book-keeping in your office, you will be doing what no one ever succeeded in doing before. If you make money," he continued, "you must make it in the shop, not in the office."

**THE GREAT STEAM HAMMER AT CREUSOT.**—The largest of the steam hammers at Creusot is something of a curiosity. It is formed of two cast-iron jacks each consisting of two parts, bolted together, and inclined to each other like the letter A. These jacks support the entablature which carries the steam cylinder, and are joined by broad plates of forged iron. The anvil is formed of 11 layers of cast-iron, planed and keyed together with special I-shaped pieces. The bed of masonry is 20 feet deep, and between the ground and the anvil are placed crossed planks, horizontal and vertical, to form a kind of elastic packing for it. The bed contains 100 cubic meters of cast-iron, 100 cubic

meters of wood and 1,000 cubic meters of masonry. Four gas furnaces and four cranes, three carrying 100 tons and one 150 tons, are in the service of the hammer, the cranes themselves carrying their own engines. The hammer, furnace and cranes are placed in a special shop built of iron. The hammer, which will have a useful effect up to 80 tons, will forge steel ingots of a weight of 100 or 120 tons, and it has been necessary to construct powerful tools for the manipulation of these masses of metal. The great hammer at Krupp's works at Essen is capable of dealing only with ingots of from 45 to 50 tons in weight.

**EUROPEAN OPINION OF AMERICAN SKILL.**—Prof. Reuleaux, of Berlin, who the *Iron Age* says generally regarded as the first of mechanical engineers in this country, if not in Europe, and a man of broad accomplishments and excellent judgment in other branches of industry and art, has just published in book form a series of letters upon the industrial position of the United States, written during a visit to the Centennial exposition last year, in which he says the wealth of our country in coal and iron is such as Europe furnishes no parallel for. In regard to machinery, it is frankly admitted that the United States has begun to occupy "one of the places in the first rank, in some respects the very first." In tool making, especially they "carry away the palm, not only at the exhibition, but seemingly everywhere." To this complimentary summing up Prof. Reuleaux joins an enumeration of the specific excellences which distinguishes American tools, which have got far beyond German products in this line, and have even "hurled the English out of the saddle." In this connection particular reference is made to American weaving machines, machines for working in wood, labor-saving machines of all sorts, and especially to printing presses. Of our future development in industry and art, he maintains that there can be no doubt, because we have education, great mechanical skill, know how to use machinery to advantage, and have natural resources far superior to anything known in Europe.

**RAILWAY SHOVELS.**—W. S. Huntington writing for the *Railway Gazette* says that a shovel may be considered by some as a tool too insignificant to be worthy of mention, but there is no implement in use in engineering work that outranks that simple and much abused tool in usefulness. And a shovel, like any other tool, should be of a kind adapted to the work it is to do. A light thin-bladed steel shovel may answer a good purpose in the molder's room of a foundry, but it is next to useless for railroad work; and yet we have hundreds of miles of road literally strewn with broken shovels, many of them not lasting to do a single day's work, when they break and are thrown aside, and very likely another of the same worthless kind is taken in hand, to soon follow it against the fence, into the ditch, or into a pile behind the tool-house. It is a waste of money to buy the thin-bladed, hard steel shovels with the straps riveted to the blade; they are dear at any price and are not intended for railroad work. The standard shovel for railroad work is known as No. 2, cast steel, and they will last until worn out; they never break. For many years a New England manufacturer supplied the demand for these shovels, but others are now producing those said to be equally as good. There is nothing gained in getting an inferior article of tools because they are cheap, for in reality they are the most expensive, and a poor road cannot afford them.

**EMERY BOARD.**—Emery paper is considerably employed for cleaning and polishing metals, but all the kinds in use hitherto have the great disadvantage of not retaining an equal efficiency. The fresh parts bite too much, and the paper itself soon gets worn through in places. Emery on linen has been tried, but without much success. The emery paper recommended herewith is not a pasteboard with emery on both sides, but a board in which emery enters as a constituent part. Fine and uniform card-board pulp must be procured, and from one-half to one-third its weight of emery powder thoroughly mixed with it, so that the emery may be equally distributed. The mass is then poured out into cakes of from one to ten inches in thickness. They must not be pressed hard, however, but allowed to retain a medium pliability. This paper will adapt itself to the forms of the articles, and will serve until completely worn out.

**GERMAN ALLOYS FOR COCKS.**—It will be of interest to Americans engaged in the production of brass cocks and the like to know something about what is considered in Germany good practice in the use of alloys. After a long discussion, the Society of Mechanical Engineers of Vienna have decided upon the following alloys as best suited for cocks and valves for machinery:

	No. 1	No. 2	No. 3
Copper.....	84	83	80
Tin.....	22.9	17	18
Zinc.....	8.4	..	2
Lead.....	4.3	..	..
Iron.....	..	..	..
Total.....	100	100	100

They believe that objects just cast, and still red hot, may be improved much in quality by rapidly cooling with water. The grain becomes finer, and the alloy acquires a greater tenacity and hardness. Especially alloy No. 2 seems to be favorably affected by this operation.

## SCIENTIFIC PROGRESS.

## Air and Altitude.

A memoir on the temperature and humidity of the air at different hours, by Dr. H. E. Hamberg, based on observations made by him during the summer of 1875, at heights varying from two inches to 22 feet above the ground, was published recently in the transactions of the Royal Society of Sciences at Upsal. The memoir is summarized in *Nature*, and is a valuable one, and is of interest to more than the mere meteorologist, it being evident that the inquiry is so handled as to bring it into close connection with such difficult questions as connection currents in the free atmosphere and the diffusion of vapor through the air.

In clear weather the temperature of the air nearest the surface was lower than that above it from two to three hours before sunset to at least two to three hours after sunrise. At all the six heights the temperature fell to the minimum at the same hour—viz., about 3 A. M.; but while it continued from this time to rise steadily at all the heights, the lowest temperature continued to be observed in the strata nearest the ground till several hours after sunrise. From this remarkable result Dr. Hamberg concludes that the increase of temperature in the lower strata of the air in the early part of the forenoon is not an immediate and direct consequence of the heating of the ground, but is rather to be attributed to absorption by the air, or, more strictly, by its aqueous vapor, of the heat received from the sun's rays or reflected from the ground.

Over uneven ground covered with vegetation the temperature is generally higher over those parts of the field which rise above the general level. Thus even slight elevations of only one or two feet have the air immediately resting on them often two degrees higher or more, whilst, on the other hand, a trench or depression one or two feet below the general level has the air resting on it two degrees or more lower than the air over the level portion of the field, a result of considerable practical importance in agriculture and horticulture.

The latent heat set free on the formation of dew appears from the observations clearly to retard the lowering of the temperature, but not to the extent which might have been expected. When, on the deposition of dew, the temperature of the air near the surface has fallen below 32°, as soon as the dew is congealed into hoar frost, the temperature of the lower stratum of the air in contact with the ground instantly rises to 32°; but at the same time the temperature of the air higher up steadily remains lower than 32°.

The absolute humidity of the air on clear nights, on which no dew is deposited, decreases from the ground upward, just as happens during the day; but, on the other hand, with dew the humidity is least nearest the ground, and increases with the height, and this influence of dew, in diminishing the humidity, extends upward to at least 22 feet, the height to which the observations were carried. Since his observations clearly show that the absolute humidity begins in the evening to diminish near the ground, before any dew is observed to be deposited, and also diminishes at all heights on those nights during which no dew whatever is formed, Dr. Hamberg is of opinion that the diminution of the humidity of the air during night is to be sought for in other physical causes than the deposition of dew.

**AMERICAN CONTRIBUTIONS TO SCIENCE.**—At the anniversary meeting of the Royal Society, Nov. 30th, the President, Sir Joseph Hooker, after a detailed examination of recent scientific investigations in America, said: "I must not close my notices of some of the labors of our scientific brethren in the United States without expressing my admiration of the spirit and manner in which the Government and people have co-operated in making known the physical and biological features of their country, and my conviction that the results which they have given to the world are—whether by magnitude or importance—greater of their kind than have been accomplished within the same time by any people or government in older continents. How great would now be our knowledge of the climate and natural features of India had its trigonometrical or revenue surveys been carried out in the same catholic spirit; and what scientific literature can England and her colonies show to compare with that of United States surveys?"

**VITALITY OF SEEDS.**—Van Tieghem contributes a paper to *L'Annuaire des Sciences Naturelles* on the reason why some seeds retain vitality longer than others. It is a question wholly of the condition of the albumen. In certain oily seeds the albumen changes its character before the plant is ready to germinate, and then the sprouting plant feeds on just what it finds, and which may or may not be nutritious; but in other cases the plant feeds directly on the albuminous matter, or, in other words, on its endosperm. There are some plants which have no albumen, and these are so constituted that they can get their nourishment directly from the soil. In old albuminous seeds that fail to show the reason is that the albumen has all or nearly all been chemically changed, and there is nothing left to give the little germ support till it is able to take care of itself. Why ex-albuminous seeds perish is not made clear.

**THE METRIC SYSTEM.**—Nearly every other nation of Europe having led the way Russia is about adopting the metric weights and measures. The special committee which is sitting at St. Petersburg, at the headquarters of the Russian Imperial Technical Society, have not only come to the conclusion that such an innovation would be useful, but have also emphatically declared that the present is the fitting moment for the introduction of the metric system. They think that the change ought to be accomplished within two years. It is a remarkable fact that Americans, with all their boasted readiness to adopt labor-saving inventions, and having led the world in use of a decimal currency, should be one of the very last nations of the globe to adopt what John Quincy Adams, in his official report, pronounces the greatest invention of human ingenuity since that of printing, and a greater labor-saver than steam. Certain persons have strenuously urged that the adoption of the international weights and measures would be a source of great inconvenience and expense to the machinists and manufacturers. The advocates of the system, having made inquiries of machinists and manufacturers in various countries of Europe, reply that the objection is one of theory and not of fact, as those who have actually tried the experiment testify. As the old machinery wore out it was replaced with the new, and a little time being taken the greatly dreaded confusion and expense were largely obviated.

**BODY AND MIND.**—Some points in the relation of the mind to the body are touched upon in a suggestive way by Prof. Nageli, of Munich, in his recent lecture on the "Limits of Natural Knowledge," delivered at the Munich meeting of the German Scientific Association, and which supplements the recent utterances of Virchow and Haeckel. "The human mind," he says, "is nothing else but the highest development upon our earth of the mental phenomena which move and animate nature everywhere. But it is not the product of secretion of the cerebral substance. As such it would be without further influence upon the brain, just as the secreted gall is of no further significance for the liver. On the contrary, sensation and consciousness have their firm seat in the brain, with which they are indissolubly united and in which, by their intervention, new conceptions are formed and converted into actions. Just as the stone would not fall down if it did not feel the presence of the earth, so the trampled worm would not wriggle if it had no sensation, and the brain would not act reasonably if it had no consciousness."

**PARSNIP PECULIARITIES.**—At the recent meeting of the French Association for the Advancement of Science, M. Corenwinder, who has long been engaged in researches upon the various alimentary roots, brought up a report on his investigations on the composition of parsnips, with which he has been chiefly occupied during the current year. He gives the chemical composition of the root as follows:

Water.....	79.450
Nitrogenous substances.....	2.303
Cellulose, pectose, etc.....	11.197
Crystallizable sugar.....	4.570
Glucose.....	0.320
Starch.....	1.075
Mineral matter.....	1.925
Total.....	100.000

From this analysis it appears that the parsnips contain an amount of crystallizable sugar by no means to be despised, especially as the root never gets frozen, and can be allowed to remain in the ground until wanted, even in the severest winters. The proportion of phosphates is abundant, and that of the potash salts collectively actually enormous, which facts should encourage a far more general cultivation of this vegetable. With regard to the amount of nitrogenous matter present, M. Corenwinder finds that it is far larger in the parsnip than in any other of the various roots he has analyzed.

**NEW FOSSILS FROM THE ALEUTIAN ISLANDS.**—At a recent meeting of the California Geological Society, carboniferous fossils were exhibited from the Aleutian islands, where they were associated with coal. The fossils were referred to Mr. S. A. Miller, of Cincinnati, a well-known paleontologist, for examination, from whom the following letter was received: "The fossils from Sitka came duly to hand. The *Productus* is, so far as I am able to determine, a new species. It forms it resembles *P. horridus* of the Permian group in Europe, the surface lining alone distinguishing it. *Productus horridus* has a deep mesial depression and fine concentric markings. This species has the deep mesial depression, fine longitudinal lines, without concentric markings. I would not hesitate to describe it if a figure could accompany the description, but I am opposed to describing a fossil without illustrating the description. If our Society of Natural History does as I expect it to do soon, I may be able to publish with proper figures. I would like, however, to have the other valve, though it is not essential. As the genus *Productus* is unknown later than the Permian, you can be assured that this fossil is of carboniferous age."

**IMBEDDED ACORNS.**—The St. Helena *Star* says: John Gillam informs us that in getting out grape sticks at his place up the valley, he lately cut a redwood tree, seven feet through and 250 feet long, in which, at a distance of 18 inches from the exterior, he found deposits of acorns, evidently stored by birds long ago and grown in by a foot and a half of solid wood.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

AUTOCRAZ M. Co.—Dec. 21. Capital stock, \$12,000,000. Directors—Thos. Oole, L. B. Ward, W. H. Sears, J. P. Stuart and M. D. C. Gibson.

BALTIMORE M. Co.—Dec. 21. Location, Arizona. Capital stock, \$10,000,000. Directors—Ginto Curries, J. H. Williams, A. Thomas, F. W. Hadley and S. F. Stone.

ALTA CALIFORNIA M. Co.—Dec. 21. Capital stock, \$5,000,000. Directors—O. F. Willey, A. J. Bryant, E. Fellows, F. Reichard, and J. A. Robinson.

WENROOT M. Co.—Dec. 22. Location, Arizona. Capital stock, \$5,000,000. Directors—John F. Snow, John Doran, J. J. Jilder, W. Weeks and James Kinsman.

## THE ENGINEER.

### Rafting a Sink.

Among other improvements recently made upon the line of the Detroit & Milwaukee railroad is the following, as described in the *Engineering News*, of Chicago: Six miles east of Grand Rapids, and on the summit of a grade, is the Saddle-Bag swamp, a deep sink hole of 2,600 feet in length, 50 feet deep in the center, and 60 feet to clay. The contents of this hole are water and muck, and the thin crust which covered the mass incapable of carrying but a very light weight. A former engineer had attempted to build a roadway over this hole, but after he had dumped a good deal of material into it with little prospect of succeeding, the attempt was abandoned, and for 20 years the roadway has been maintained on seven and eight degree curves around the northern top of the slough. This season Mr. Masson, the engineer of the road, attacked the problem with his slabs and sand, and in three months with one train, 50 men on the train and 25 on the dumps, raising track, etc., and at a cost of \$10,000 in all, a solid roadway was carried over the hitherto unpassable ditch, and all trains are now running across it. Slabs and edgings 16 feet long were laid down and firmly bound together by being crossed, until a raft ten feet thick was built, upon which the train of sand cars could be run. Sand was hauled on until the sinking of the road-bed ceased, and the track was brought to grade. The greatest difficulty to contend with was the tipping of the rafts, which were a source of great annoyance, and had to be carefully guarded against. The roadway is now suspended over the hole by this raft, and no fears are entertained as to its permanence, since there is no outlet for the water and no chance for a washout. If the water could be drawn off by means of a drain, which, however, would need to be nearly 50 feet under ground, the road-bed would be made still more permanent. In the saving of wear and tear of rolling stock and rails in the sharp curves, the cost of the improvement will soon be made up.

### The Ten-Inch Railway.

We have formerly alluded to the building of a railroad with ten-inch gauge in Massachusetts. It is called the Bilerica & Bedford road.

The proprietor or inventor of this road is named George E. Mansfield, who is a practical wood and iron machinist and engineer. There are 11 bridges on the route of this road over 100 feet long. The rail weighs 25 pounds to the yard, though it is believed that 20 pounds to the yard would be sufficient. One grade on the road is 155 feet. The cars and engines of the road are very well proportioned, and make a very handsome appearance. The engine is behind the tender, and next the cars, so that when the train moves the car next the engine draws down upon and increases the adhesion of the engine to the track. Both engine and cars are constructed so as to be very near the ground, giving great advantage in regard to safety, also very little oscillation. The cars have an aisle, with one seat on each side, in the same manner as ordinary cars have two seats. The length of the cars allows 30 seats, each person having a seat to himself. The cars are warmed with steam, and well ventilated, have closets, water-tank, all the modern improvements, Westinghouse brakes, etc. They weigh but four tons and a half, ordinary cars weighing on an average 18 tons. Hence Mansfield will carry 60 persons with cars weighing nine tons, while ordinary roads must draw 18 tons to carry 56 persons. An Eastern exchange says: The engines are equally light and less costly than on ordinary roads. It is quite evident that a road eight and a half miles long, which cost equipped \$1,500 less than \$50,000, and which can be run for half the expense upon ordinary roads, must be a great and noble achievement. The road cost \$4,500 per mile, the right of way free. The trains run about 20 miles per hour. Engines weigh about eight tons, and draw two passenger and two freight cars twice per day each way, at a cost of coal only one-fourth that of ordinary engines.

U. S. NAVAL SCHOOL FOR ENGINEERS.—The United States dispatch boat *Tallapoosa*, which left for Philadelphia and Washington on Friday, transferred to the training-ship *Minnesota*, before her departure, the first class of boys for instruction in the engineering department of the Navy. The *Iron Age* says: The idea of training boys as first-class firemen and machinists for the navy originated with Capt. A. W. Johnson and Engineers Wharton and Magee, and thus far the results have made greater progress than was at first anticipated. There are already two classes of this character under courses of most careful instruction, and their acquisition to the service, it is stated, promises to give it what has long been felt to be a great need, namely, fireman and machinists who could be trusted on shore as well as on board ship, with ability vouchsafed for by responsible persons and men of good character. The boys for the engineering classes are selected from those who enlist in regular order and who show a marked proficiency in mechanical studies. Besides their mental course of instruction on board ship, they also receive mechanical instruction in the machine shop at the navy yard dur-

ing this winter and on board of cruising vessels during the summer. At first the idea was tried as an experiment, but it has met with such valuable results that it is intended to continue organizing new classes. About 200 boys are at present under instruction in various studies on board the *Minnesota*, but Capt. Johnson says that he finds considerable difficulty in obtaining and maintaining the number allowed, owing to the mistaken impression that the training-ships of the navy are reformatory institutions.

DEEP SEA PLOWING.—It seems they are beginning to run plows on the sea bottom to loosen up the soil for the dredges. The *Journal of Chemistry* says: "During the past summer we witnessed this deep sea plowing in the harbor of Belfast, Maine. The bottom of the bay is covered with a tenacious, clayey deposit, into which the steam shovel penetrates with difficulty, and to loosen it a huge Michigan plow was set at work under the water, drawn by steam power on the shore, using a wire rope to form connections. The water at high tide was about 20 feet deep when the plow was working. The man that held it was encased in the diver's armor, and supplied with air by a flexible tube connecting with an air-pump on board of a vessel floating above. He came up at our request, and after removing his air-tight helmet, and conversing a few moments, was again put in connection with the pump, and, disappearing under water, went on with the plowing. This to us was a novel proceeding, and, so far as we can learn, it was the first experiment of the kind ever made."

THE FRENCH AND THE DARIEN CANAL.—We notice that the French are still agitated about canaling our isthmus, and Lesseps, the Suez hero, is enlisted in their projects. We read that a geographical society of Paris has lately sent out an expedition under Lieut. Wise to discover the best route. This officer has made a report, in which he favors the scheme of cutting a direct canal in a straight line, south of the Panama railway, from the Chuquisaca northeast to Port Gande, which he asserts can easily be done, the ground being completely level and presenting only relatively narrow masses of earth to be removed should it be decided to form a tunnel. In his opinion, an inter-oceanic canal by way of Columbia will soon and easily be made. Viscount de Lesseps, who constructed the Suez canal, is understood to be the advising engineer of the French Darien Canal Association. French capital, science and enterprise have accomplished wonders in the Suez canal, and may achieve equal triumph on this continent if we have no ambition that way ourselves.

THE TENNESSEE RIVER IMPROVEMENT.—There was held last week at Chattanooga a convention to urge upon Congress the importance of a more vigorous prosecution of the work of making a ship canal through the mussel shoals of the Tennessee river. The governors, boards of trade and public-spirited citizens of three States took part in the movement, which thus acquires something of national importance, and invites a measure of attention rarely given to schemes of local improvements outside of the neighborhoods to be immediately and chiefly benefited. The improvement of the Tennessee river cannot, however, be regarded as a local improvement, and a consideration of the facts of the case should disarm any opposition which may grow out of a misconception of the importance of the work, already about half completed.

MICHIGAN SHIP CANAL.—The convention to favor the construction of a ship canal across Michigan held at Allegan in that State, Nov. 16th, was attended by about 150 persons from along the proposed line. Resolutions were adopted stating that the proposed canal would shorten the water distance between Chicago and Buffalo 500 miles, would "lessen insurance, reduce the freight rates, prolong the season of safe navigation for two months, and greatly lessen the dangers of commerce over the present hazardous route via the straits of Mackinaw," and calling upon Congress for an appropriation of \$25,000 for an official survey. No estimate seems to have been presented of the probable cost of the work.

THE CINCINNATI SOUTHERN RAILROAD.—The Cincinnati *Commercial* says: There is a very fair prospect now for an early extension of this Southern railroad for 20 miles beyond the present terminus—Somerset—to the coal mines, below the Cumberland river.

THE SOUTHERN PACIFIC.—More passengers and freight than usual are being transported over the Southern Pacific railroad, and the business of the company is gradually increasing. A large supply of steel rails, imported from the East, together with cross-ties, timber and other material from California and Oregon, are now lying at Oakland in readiness for immediate use. Surveys have been completed from Yuma, the present terminus, to a point 160 miles distant, near Maricopa Wells, where the road is expected to reach ere long. A strong force of men, who are now engaged in finishing another job, will, it is said, be shortly put to work, when the track will be laid at the rate of two miles per day. Other and extensive preparations are soon to be made to push the road forward, and it is the intention of the Directors for it to be at El Paso, some 500 miles from Yuma, in less than two years hence.

### Workmen on the Comstock.

The *Virginia Enterprise* says: We believe it to be right, and that we shall be doing the miners and other working men of the Pacific coast a kindness by warning them against rushing hither in the expectation of obtaining employment, expending in so doing the last cent (in the majority of cases) of their slender means. The advance in price of the leading mining stocks which followed the new ore development on the 1,900-foot level of the Ophir mine, would seem to have turned hitherward all the wandering, undecided laboring men of the Pacific coast.

Noting the rise in stocks, and the corresponding improvement in times along the Comstock, men in search of employment quite naturally concluded that there would be an opportunity for them to find work in the mines, mills, or on the surface, in some of our towns. But in this they made a sad mistake, as great numbers have found to their sorrow and their cost.

There are miners enough and workmen enough of every kind belonging here on the Comstock lode to do twice the work there is at present to be done in any branch of business. The sooner this is understood abroad the better—the better for us who are here to find that they have made their journey and expended their little means for naught.

Let persons at a distance call to mind the lines they have seen formed in front of post-offices in the early days, and they will have some idea of the chance there is of their getting work, here when we tell them that at every mine and mill in the country there are men enough waiting for work to form a line from 10 to 40 rods in length.

These lines are not actually formed, but this condition of affairs here is substantially the same, as far as outsiders are concerned, as though they were. The men are here, waiting and watching. As fast as one man steps out of a mine, or is killed, another steps in and takes his place, provided men are being taken at all. For a considerable length of time many more men have been drafted out of the mines than have been taken in. All these are now here waiting and hoping that something may occur that will cause additional forces of workmen to be put to work in the principal mines. What chance, then, for newcomers, when so many old miners are out of employment?

It may not be generally known to the outside world, but owing to the scarcity of work here at this time there are many families that are being constantly assisted by our Relief Committee. Women and children, and not unfrequently men, are to be seen at the several mines waiting for the men to come "off shift" in order to get what food may happen to be left in their lunch pails.

Men coming here now will not only obtain no employment, but will—provided they come without means to get away—swell the ranks of the destitute and add to the distress of those who are already the recipients of charity.

What has been said above in regard to the present opportunities of obtaining employment in our mines and mills will apply equally well to all other industries and branches of business. Our carpenters had no work worthy of the name last summer; the painters found next to nothing to do; blacksmiths and mechanics of all kinds were out of employment, and hosts of workmen in all these trades are still searching for work.

Men who want work will do better in the small mountain towns of California, or on the ranches of that State, this winter, than by coming here. There they will at least be sure of getting something to eat, even though the wages they receive be small. Let men who are out of work go to the ranches and split rails, dig ditches, herd stock—do anything rather than come here to swell the army of the idle.

### Mining at Fiddletown.

Mining operations on a more extensive scale than Fiddletown has known for many years, says the *Amador Ledger*, are now in progress in this ancient camp. Auriferous channels are known to exist in the vicinity, and in early days the miners raked in the golden harvest without much difficulty. As time wore on and the surface deposits became exhausted, the expense of working became greatly augmented, stretching beyond the means of the individual miner. Depression brooded over the camp, awaiting the advent of moneyed men to dispel it. The gold-bearing sands were known to reach far deeper than the workings had heretofore gone, but the vast outlay of capital requisite to provide an outlet for the water and debris was a responsibility which only capitalists could venture to assume. Two years ago the American Flat Gravel company was formed and purchased most of the claims around Fiddletown. For a time all was bustle; the roar of three or four giants was kept up day and night. But the difficulty of providing dumping facilities cropped up again. Five men were frequently employed to keep the boxes clear of debris. To obviate this difficulty a Cranson elevator was put up to raise the dirt and ensure a greater fall of water. This contrivance proved not a success, whether from unskillful management or otherwise we are unable to say. The company got involved, the stockholders became disheartened, and work was brought to a standstill. Faith in the richness of the deposits remained unimpaired. A shaft sunk within a few feet of one of these

banks revealed the fact that the pay dirt in that spot was 60 feet through; some of it, we are told, prospecting as high as \$1 to the pan. Latterly the company has changed hands. C. J. Garland, owner of the Sutter Creek and Drytown sulphur works, than whom a more enterprising man lives not in Amador county, is now the moving spirit of the enterprise. With other men of means, he has bought out the company, leased the Purinton ditch, and has started in to open up the mines in a thoroughly scientific manner, regardless of cost, believing that the most efficient method will prove the cheapest in the long run. A. Harris is the new Superintendent. He is the right man in the right place, his extensive experience in mining in California, Nevada and Arizona rendering him peculiarly fitted for the position.

On Saturday last we visited Fiddletown, and in the absence of the Superintendent, C. A. Purinton, one of the live men of the town, kindly undertook to show us over the works. We were surprised at the magnitude of the preparations to open out the property. A race 3,000 feet long is being cut to tap the nearest claim on Slate creek, the terminus being at a point of the creek where the rapid descent will give the water sufficient velocity to carry away the debris. There were 70 men in all working upon the race. The undertaking is being pushed ahead with the utmost energy, under the able foremanship of J. Hippart. The cutting in some places is over 13 feet deep and will average six or seven feet, mostly blasted through solid rock. The boxes are 30 inches each way, constructed in a substantial manner out of 1½-inch timbers, with sills four inches wide. Ground was first broke on the last day of October, and at the time of our visit the cutting was finished for two-thirds of this distance, and 97 boxes out of a total of 186 were in position. It is calculated that the job will be completed by the 1st of January next. It will undoubtedly be the finest piece of work in the county. The total cost will approximate \$12,000 or \$15,000. When it is remembered that the race will enable the channel of pay dirt to be robbed of its golden wealth for 25 or 30 feet deeper than heretofore, the outlay is not extravagant. A fair-paying placer claim will soon repay this sum. The ground owned by the company will require many years to work out. Should this venture turn out remunerative, it will open up a long era of prosperity for Fiddletown and vicinity. The company expect to use this winter, upon their claims alone, 600 inches of water.

### Smelting Ores.

Those of our people who shall next spring go forth into the wilds for the purpose of prospecting for new mines will undoubtedly keep a bright lookout for smelting ores. The permanence and prosperity of Eureka and other mining towns and camps where smelting ores are worked have given our prospectors a much more exalted idea of the value of base metal veins than they entertained in regard to such mines in former times. Besides there is now beginning to be a market for such ores. At various points along the Central Pacific railroad there are parties ready to purchase them. A man who may have the good fortune to find a lode yielding rich argentiferous galena, or any other smelting ore, at a point not too far distant from the railroad may at once begin to reap his reward. It is not necessary for him to put up a furnace or make any great outlay of money for any purpose. With an ordinary windlass and a few tools he may extract his ore and haul it or pack it to the railroad and either sell it on the spot or ship it, when he shall have accumulated a carload, to the nearest point where he can have it smelted.

It is not necessary for him to await the slow assistance of timid capital. Although he may begin operations in quite a small way, he will have the satisfaction of feeling that he is quite independent and secure from the delays and machinations of greedy and selfish manipulators. Soon, provided he have a mine of real value, he will be able to erect a furnace, smelt his own ores, having preserved his independence and the entire control of his business from the first.

In the regions skimmed and scratched over by the early prospectors, who were in search of free milling ores, there is still a good field for miners who are in search of ores for smelting. Some of the best smelting ores present such an unattractive appearance, from the iron and other base metals they contain, that the pioneer prospector hardly halted to look at the veins in which they were contained. A certain per cent. of iron is necessary in smelting, and if it be not found in the ore that is to be operated upon it must be added, yet many veins of very valuable smelting ore have undoubtedly been run over by prospectors, who thought them nothing more than deposits of a poor quality of iron ore.

Not only do the base metal lodes offer a field in which the poor man may obtain adequate return for his outlay of muscle, but they are also worthy of the attention of men of capital. The day is not far distant when ores now considered to be of a very low grade will be profitably worked, either here or at some point to which they may be cheaply shipped. It has been ascertained that base metal mines may be depended upon as regards permanence, therefore, those who shall now secure such mines, by patent or otherwise, will one day be able to draw from them regular and handsome incomes. Trains of cars loaded with these ores may be run as cheaply as the gravel trains are run.—*Enterprise.*

## Condition of National Banks.

The following is an abstract of reports made to the Comptroller of the Currency, showing the condition of the national banks in the United States at the close of business on Monday, the first of October, 1877. There are 2,080 banks in operation:

RESOURCES.	
Loans and discounts.....	\$ 888,243,200
Overdrafts.....	3,677,303
United States bonds to secure circulation.....	\$36,510,950
United States bonds to secure deposits.....	14,903,000
United States bonds on hand.....	30,088,700
Other stocks, bonds and mortgages.....	34,435,965
Due from approved reserve agents.....	73,284,138
Due from other national banks.....	45,217,246
Due from State banks and bankers.....	11,415,703
Real estate, furniture and fixtures.....	45,229,983
Current expenses and taxes paid.....	6,015,792
Premiums paid.....	9,219,174
Checks and other cash items, exchanges for clearing house.....	74,625,215
Bills of other national banks.....	15,581,784
Fractional currency.....	2,376,083
Specie, viz: gold coin.....	4,309,656
Silver coin.....	3,700,703
United States certificates.....	14,088,460
Legal tender notes.....	60,820,084
U. S. certificates of deposits for legal tender notes.....	35,410,000
Five per cent. redemption fund.....	14,494,633
Due from U. S. Treasurer.....	1,527,119
Total.....	\$1,741,084,080
LIABILITIES.	
Capital stock paid in.....	\$ 470,467,771
Surplus fund.....	122,776,121
Other undivided profits.....	44,572,078
National bank notes outstanding.....	291,874,236
State bank notes outstanding.....	481,755
Dividends unpaid.....	3,623,703
Individual deposits.....	610,403,957
United States deposits.....	7,972,714
Deposits of U. S. disbursing officers.....	2,376,083
Due to other national banks.....	115,028,954
Due to State banks and bankers.....	46,577,439
Notes and bills rediscounted.....	3,791,219
Bills payable.....	6,137,116
Total.....	\$1,741,984,080

**GERMAN COAL.**—Hamburg has been the scene of a rather novel exhibition, that of German coal, which, we are told, has excited much interest among German patriots and commercial men. The idea that Germany should endeavor to emancipate herself from the English market and produce her own coal has, it appears, acquired a powerful hold upon the national imagination and hence the promotion and development of the German coal trade has come to be looked upon as a matter of patriotism. It is also alleged that Westphalian coal is superior in heating power to English, and Senator Godeffroy, in his address on the occasion of the opening of the exhibition, even made it appear that Germany is in possession of coal fields incomparably larger than any that England can show. The Westphalian coal basin alone, said M. Godeffroy, is capable of producing for seven centuries to come the same quantity of heat coal annually that all England now yields, and beyond this the basin is not yet fully explored, and is probably capable of material extension. With all these supposed advantages Germany has not yet been able to heat England out of the field on her own ground. The *City of Hamburg* imported in 1876 about 1,500,000 tons of coal, of which about six-sevenths were the produce of England, and only one-seventh of home production.

**TRYING TO LIVE WITHOUT WORK.**—The following, from the pen of Horace Greeley, is true and applicable to this day: "Our people are too widely inclined to shun the quiet ways of producing labor, and try to live and thrive in the crooked paths of speculation and needless traffic. We have deplorably few boys learning trades, with ten times too many anxious to get into business; that is, to devise some scheme whereby they may live without work. Of the journeymen mechanics now at work in this city we judge that two-thirds were born in Europe, and the disparity is steadily augmenting. One million families are trying to live by selling liquors, tobacco, candy, etc., in our cities, who could be spared therefrom without the slightest detriment; and if these were transferred to the soil, and set to growing grain, meats, wool, etc., or employed in smelting the metals, or weaving the fabrics for which we are running into debt in Europe, our country would increase its wealth at least twice as fast as now, and there would be far less complaint of dull trade and hard times."

**LOWELL AND LIBERTY HILLS.**—The Swamp Angel is turning out pay all the time, at about the rate of \$3 per car load, the pay being found about 1,500 feet in length on the channel, and they have drifted several hundred feet across the channel with good pay dirt all the way. Below the Swamp Angel, on the Steep Hollow side of the ridge, W. P. Dewey is driving a tunnel into the Levy ground, of which he was the purchaser, and below this the East New York company, and also the Wild Cat company are tunneling for the channel. On the opposite or Bear river side of the ridge, the Planet company is the only one at work. Their tunnel is now in 600 feet, 100 feet having been made in the past month. The contract is for 800 feet of tunnel, which will be completed by the 1st of March. The Planet ground comprises 229 acres, and it adjoins the Swamp Angel near the center of the ridge. This is regarded as one of the very best claims in that portion of the county, it covering a portion of the same rich channel found in the Swamp Angel, and from which a large amount of gold has been taken.—*Grass Valley Union.*

## USEFUL INFORMATION.

## Manufacture and Uses of Bird Lime in Japan.

Bird lime or "mochi" is extensively produced and used in Japan, as we learn from a recent report by a British Consul. The principal tree from which it is made is a dark evergreen, having its habitat in the southern half of Japan; it grows high up the shady sides of deep mountain glens. Its bark is of a greyish-brown color, and roughish texture; the leaves are opposite, smooth, dark-green, rather more pulpy than the English holly leaf, ovate-acuminate in form, have an unbroken linear edge, a very short petiole, and almost imperceptible stipules. Its efflorescence is a panicle, centripetal in its development, having small white, wax-like diandrous and monopetalous florets, which are also slightly cruciform.

The manufacture of bird lime extends over a period of several months commencing about June, when the bark of the mochi tree is stripped off and macerated in water for about 40 days, after which it is collected and beaten in a mortar. The pestle is slod with iron, the flat under surface of which is armed with spikes projecting downwards. When the pulpy mass under the pestle becomes glutinous, it is taken out and washed in water. This is done to remove as much as possible of the rough outer bark, and the pulp is then again pounded and treated in a cauldron with hot water, on the surface of which it floats. During this treatment it undergoes continual manipulation at the hands of the workman, for the purpose of disengaging the remaining particles of bark, which sink to the bottom of the boiler. This is the most difficult part of the process, as considerable skill and experience are required in the workman to keep the stuff from adhering to his hands. After this it is again washed in cold water, and the pounding, boiling and washing are repeated until the material becomes sufficiently clean and pure. During the above process about nine-tenths of the weight of the raw material is lost, 250 catties of the latter not turning out more than 25 of good bird lime.

The uses to which this article is put by the Japanese are more extensive and diverse than one would suspect, its principal one being, of course, for the snaring of birds and animals. By its means animals as large as monkeys are caught. When they once get the stuff upon their paws they soon cover themselves with it and so exhaust themselves in trying to get rid of it that they fall an easy prey. Birds also as large as ducks are taken. Rats are easily caught by spreading a small quantity on a piece of board or paper, and placing it near their holes. It is spread upon a bamboo leaf and universally used throughout Japan during summer for catching flies or other insects. It might be as well to mention that a very inferior quality of bird lime is made out of wheat by most of the "fuga" (makers of wheat food); it soon loses its properties and becomes useless.

**BOXWOOD.**—The wood of *Buxus sempervirens*, which is almost exclusively used for the best kinds of wood engraving, has been for some years becoming more and more scarce. Wood of the largest diameter is the produce of the forests of the countries bordering on the Black sea. Large quantities are produced in the neighborhood of Poti, from which port the wood is shipped direct to England. The supply, however, from this port is, we learn, becoming fast exhausted, and it is said, unless the forests of Abkhassia are opened to the trade, it must soon cease altogether. The quantity exported from Poti during the year 1873 amounted to 2,897 tons, of the value of £20,621; besides this, from 5,000 to 7,000 tons of the finest quality annually pass through Constantinople, being brought from southern Russia and from some of the Turkish ports of the Black sea for shipment, chiefly to Liverpool. An inferior and smaller kind of wood, supplied from the neighborhood of Samson, is also shipped at Constantinople to the extent of about 1,500 tons annually. With regard to the boxwood forests of Turkey, the British Consul at Constantinople reports that they are nearly exhausted, and that very little really good wood can now be obtained from them. In Russia, however, where some little government care has been bestowed upon forestry, a considerable quantity of choice wood exists; but even there it can only be obtained at an ever-increasing cost, as the forests near the sea have been denuded of their best trees. The trade is now entirely in English hands, although formerly Greek merchants exclusively exported the wood. In the province of Trebizonde the wood is generally of an inferior quality; nevertheless, from 25,000 to 30,000 cwts. are annually shipped, chiefly to the United Kingdom.

**TO REMOVE SILVER STAINS FROM WOVEN FABRIC.**—The following process is said to be especially successful in removing spots from materials which have been several times washed: First prepare a saturated solution of chloride of copper; dip the spotted piece in the solution, and allow it to remain some minutes, or according to the character of the stains. Then rub the stains with a crystal of hyposulphite of soda. When neutral chloride of copper is used, the color of the stuff does not change. This process can be repeated.

**ACRES OF COAL AFLOAT.**—The amount of coal shipped from Pittsburgh to ports on the lower Ohio and the Mississippi on the present high water, gives some idea of the vastness of our internal commerce. The *Iron Age* says: In a little over 24 hours 8,344,224 bushels of coal left the harbor of Pittsburgh. The bushel being 76 pounds, this would be 317,081 net tons, requiring a fleet of 51 steamers or tow-boats, 201 coal boats and 335 coal barges. On the basis of 100,000 bushels to the acre of mine surface, there would be 83½ acres of coal, and the boats and barges would cover an area of about 45 acres, so that each steamer would tow, on an average, about an acre of boats and two acres of coal as measured in the vein. The towing is not by line, with the boats following after the motor, as the term would seem to imply. With a tow of, say, 12 boats or barges, one would be lashed to each side, while ten would be placed in front, five long and two wide, each barge being about 130x24 feet. This mass of boats is firmly lashed together, the steam tow-boat in the rear, and the flotilla is propelled ahead of it. This system of towing began in 1850, the *Lake Erie* making three trips with four barges carrying 16,000 bushels. Before this time all the coal was floated down the river in large flat-bottomed boats propelled by muscle and tide. Each boat contained 15,000 bushels, and were "run" to their destination in pairs.

**TAR WATER FOR INSECTS.**—For the last five years I have not lost a cucumber or melon, vine or cabbage plant. Get a barrel, with a few gallons of gas tar in it; pour water on the tar; always have it ready when needed, and when the bugs appear give them a liberal drink of the tar water from a garden sprinkler, or otherwise, and if the rain washes it off and they return, repeat the dose. It will also destroy the Colorado potato beetle, and frighten the old long potato bug worse than a threshing with a brush. Five years ago this summer, both kinds appeared on my late potatoes, and I watered with the tar water. The next day all Colorado beetles had not been well protected from the sprinkling were dead, and the others, though their name was legion, were all gone, and I have never seen one of them on the farm since. I am aware that many will look upon this with indifference, because it is so cheap and simple a remedy. Such should always feel both their own and their neighbors' hugs, as they frequently do.—*Chicago Tribune.*

**TO WASH RED TABLE LINEN.**—Use tepid water, with a little powdered borax, which serves to set the color; wash the linen separately and quickly, using very little soap; rinse in tepid water, containing a little hoiled starch; hang to dry in the shade, and iron when almost dry.

## GOOD HEALTH.

## Drinking Water.

Water, says a writer in the *Prairie Farmer*, should be discreetly used. An excess of water dilutes the gastric juice, and lessens its digestive force. In small portions it may aid digestion if the food has been only partially dissolved, and retains its solid form when it has reached the stomach. Experience and observation show that a small amount only of any drink, hot or cold, should be taken with or after our daily meals.

Warm drinks, or infusions, ordinarily promote the exudation of the digestive juice, hasten the contents of the stomach into the duodenum just below, favors intestinal digestion, and aid the passing of the nutritious portions of the food into the circulation of the blood. Food only partially dissolved in the gastric sack is floated by water into the upper part of the intestinal canal and there exposed to more complete solution and fitness for absorption.

A proper amount of water, then, favors the nutrition of our food and promotes the secretion of all the glands. Large amounts of cold water may obstruct the tubes through which any secretion, as milk, may flow. May not warm water, slightly salted, contribute to the lactic secretion of cows and other animals? A warm bowl of milk, or gruel, taken between meals, increases the natural supply of infantile food.

Luke warm water, or a weak infusion of mustard, so weak as hardly to be tasted, forms a better emetic than any other material for relieving a crowded or distended stomach. All food that cannot be digested, should be at once removed. Half a pint of mustard water is usually enough, but repeat the draft every 15 minutes until it proves effective.

The good or ill effects of water are not limited to the stomach, but are equally apparent in the intestines. It not only transmits the digested food over their large extent of surface, but aids the lacteals in its absorption and keeps the waste in proper motion.

Hence drinking water early in the morning may be of great use to those who are annoyed by constipation. The bad taste in the mouth, the want of appetite at breakfast, may be usually corrected by drinking hot or cold water an hour before taking the morning meal. As free water drinking may remove constipation so it may cause diarrhea if taken in excess.

## The Hygiene of the Eyes.

The following hygienic rules are compiled and condensed from eminent French and English authorities: For the worker the light should come as much as possible from the left side, that is to say, from the side towards which one turns in working. Daylight is the best; but direct sunlight and that reflected from mirrors should be avoided. The aspect should be northern, and the light should come a little from above.

White walls should be avoided; highly varnished tables and, in workshops, shining articles like silk should be protected from the sun's rays.

Artificial light is always bad on account of the heat and the exhalation of carbonic acid. The best is that of lamps fed with vegetable oil (much used in France, but seldom in this country) and furnished with a glass shade. Gas is bad, because of its heat, brilliancy, and mobility; the light of mineral oil is too hot; that of candles insufficient and flickering. The eye of the workman should avoid the light coming to him directly or diffused through the room.

Working immediately after meals is objectionable; also uninterrupted use of the eyes for long periods of time. One should write on an inclined plane, and not keep the head bent down more than is absolutely necessary. Reading in bed is bad everywhere.

Some good authorities commend washing the eyes with cold water, but the majority of the best ophthalmologists advise the use of hot water for the less serious affections of the eye. For tired eyes we believe, from our own experience, that water hot as can be borne is refreshing and beneficial.

If the eyes are fatigued by bad artificial illumination, blue or slightly smoked glasses will be useful, and in order to avoid the lateral rays they should be large and round.

If the irritation of the eyes persists, all work must be abandoned, and an examination made to see if there be any disturbance of refraction, of power of accommodation, or of the mobility of the eyes.

Presbyopia, or so-called "far-sightedness," supervenes earlier with those who are constantly at work than with other individuals, and as soon as it does convex glasses should be at once resorted to, without which the muscle of accommodation would be fatigued to no purpose. At first they should be used for working in the evening, after the fatigue of the day; but a long-sighted person should only use spectacles for looking at near objects, not at far ones.

Work requiring close application favors the development of myopia, or "near-sightedness," precisely in proportion as the conditions of illumination are bad. If the action of these causes continues, the myopia will increase until vision is lost.

A slight degree of myopia may be favorable to close work, but, as a general rule, work requiring close application, by the derangement of circulation that it inevitably induces in the eye, is much more injurious to the myopic, and is the great cause of the development of myopia and its complications. Young people should be examined, and if they are myopic, hindered from undertaking tedious studies and all professions demanding close application of the eye.

**DRINK FOR WORKERS.**—In a leaflet circulated by the Church of England temperance society on harvest work, the following recipe is extracted from the valuable hook on "The Personal Care of Health," by the late eminent Dr. Parkes: "When you have any heavy work to do, do not take either beer, cider, or spirits. By far the best drink is thin oatmeal and water, with a little sugar. The proportions are a quarter-pound oatmeal to two or three quarts of water; it should be well hoiled, and then one ounce or an ounce and a half of brown sugar added. Shake up the oatmeal well through the liquid. In summer, drink this cold; in winter, hot. You will find it not only quenches thirst, but will give you more strength and endurance than any other drink. If at any time you have to make a very long day, as in harvest, and cannot stop for meals, increase the oatmeal to half a pound, or even three-quarters, and the water to three quarts. If you cannot get oatmeal, wheat flour will do, but not quite so well. For quenching thirst few things are better than weak coffee and a little sugar; one ounce of coffee and half an ounce of sugar hoiled in two quarts of water and cooled, is a very thirst-quenching drink. Cold tea has the same effect, but neither are so supporting as oatmeal. Thin cocoa also is a very refreshing and supporting, but more expensive than oatmeal."

**POISON IN THE MILK PAIL.**—A Georgia correspondent of the *New York Tribune* cites a case of poisoning from drinking buttermilk. Instances of nausea with symptoms of poisoning occur every now and then, not only from the use of buttermilk, but milk itself, and also the butter and cheese made from it. These cases all have a similar origin, namely: poisonous ferments taken into the milk through the body of the cow from her partaking of bad food or water. They are developed in buttermilk by the agitation in churning, and they are intensified by concentration in cream, butter and cheese. Such instances indicate the strong necessity for watchfulness in guarding against decaying food and bad water for milch cows. Scalding the new milk before setting, and setting shallow so it will soon cool, prevents every such occurrence by killing the ferment.

Rock Breaker for Sale; Assessment Notices—California Fruit Growing Association; South Overman Consolidated Mining Co.

## The Week.

The rain is the topic which strikes the most tuneful chords. That which fell on Sunday last had more marks of an effective, and we may say business-like, storm than any we have had for many months. It was indeed a sharpener of zest for Christmas and its merry-makings in all homes, both in city and country. It was in itself a Christmas gift to a waiting State. To show the area covered by the storm and the measure of the downfall, we compile the following table, which is true to Dec. 25th:

LOCALITY.	Last Storm.	Season.
	Inches.	Inches.
Niles, Alameda Co.....	1.02	3.26
Pleasanton, Alameda Co.....	.60	2.20
Livermore, Alameda Co.....	.44	2.15
Midway, Alameda Co.....	.31	1.33

This table shows that the rainfall reached nearly all sections attainable by rail and from which reports have come. On the mountains the snow fell quite freely, from 5 to 18 inches in depth being reported at different points along the railroad crossing the Sierras. This downfall has been of incalculable value and revives all to the hope of more to come.

## Close of the Volume.

With this number we close volume XXXV of the MINING AND SCIENTIFIC PRESS, only to begin with renewed vigor the thirty-sixth. The full and complete index on the last page, the preparation of which in itself is no little labor, will be of great convenience to those who keep the files of the PRESS. A glance at this index will show the variety of subjects which have come under our observation during the past half year, and prove, moreover, the value of this journal to its industrial readers. The index embraces a very wide range of subjects, every topic which would be of interest to the miner, mechanic, manufacturer or lover of science having been touched upon more or less according to its importance.

We have given from week to week the current mining news from the various counties of this State and the districts in Nevada, Colorado, Utah, Idaho, Montana, Oregon, Arizona and New Mexico. There is scarcely a mine that has not been more or less frequently mentioned in the "Mining Summary." This news has been presented in a condensed form and segregated in counties and districts for ready reference. We have given every week the daily prices of mining stocks, the highest and lowest prices for the week and a review of the market. The table showing the assessments levied, dividends paid and meetings to be held has been carefully corrected and furnishes in itself a complete "Mining Shareholders' Directory."

The amount of hullion shipments from prominent mines has also been carefully compiled each week. While paying more direct attention to home mining affairs, we have let no opportunity escape to profit from the experience of older countries and have described in detail such new appliances or processes as from time to time have appeared. Where necessary, these have been described with the aid of engravings, as have such new mechanical devices as we have thought would be of utility on this coast.

In the department of "Mechanical Progress" we have collated from domestic and foreign exchanges everything of interest occurring elsewhere, and have given in a condensed form descriptions of all the new devices and inventions or improvements on old ones which have been brought forward. In "Scientific Progress" everything of general interest to the scientific world has been noticed, and placed in such a shape as to be comprehended by any one. In the "Useful Information" column items of information on every conceivable subject have been gathered; and "Good Health" has been the title bead to many articles of value and benefit to both the well and sick. The "Engineering" department which was established this year has enlisted many new readers, and we have endeavored faithfully to collate for it only such matter as would be useful and interesting to Pacific coast readers.

We are pleased to say that our correspondence page has been well filled this year and has often run over its proper boundaries. The correspondents of a paper, especially a technical journal, give it great value, and we are pleased to number among those who have contributed to our columns many intelligent men well posted on what they write.

We have each week given the list of patents granted to Pacific coast inventors, and described in detail, or illustrated, those which seemed of more general utility than common, or more adapted to the wants of the industrial classes. Our index gives in brief form a list of all the inventions patented by Pacific coast inventors during the past half year. We have also devoted considerable space of late to news matters, giving all the latest news in a condensed form. We have besides given "Items of Interest from the Mines," compiled from official sources, which give briefly such news of importance from prominent mines as does not appear in the "Mining Summary." Among other things of which we may be said to have made a specialty, is that of mining law. We have carefully watched legislation, either State or National, and given the views of the mining public on these questions. We have given in full all new laws or mining decisions, and kept track of every change which has occurred. We have been at great trouble to answer plainly and clearly such questions as have been propounded to us on matters pertaining to the mining laws, and flatter ourselves that we have been uniformly correct. The paper has no doubt been of great benefit to many working mines in this matter alone.

In this volume will be found, as in previous ones, the full proceedings of our local Academy of Sciences as well as many of the more important papers read before that body. The volume also contains a very full and comprehensive account of the exhibition held this year under the auspices of the Mechanics' Institute. We gave the opening exercises, speeches in full, the list of exhibits, of awards, etc., and described in detail all of the more important exhibits and characteristics of the exhibition. Many of the articles there shown were illustrated in this journal, and the volume gives a complete history of the fair.

As great attention has been turned towards Arizona this year we have been careful to obtain all the reliable information possible from that part of the country and have published a great deal concerning it. Another subject of interest has been the working of dry placer mines, and we have described in detail the various machines intended to work such mines. The Comstock, to which renewed attention has been called, has received a large share of notice, and beside the weekly summary of mining news from there, we have published everything of general interest connected with the working of the mines. We have kept watch also on our foundry interests and described from time to time the new machinery they were making for mining or other purposes, and whatever was new or of interest in that line. Feeling, moreover, that everything that tends to build up home manufactures is good for the community, we have given full notice of everything of the kind that has been established. Our readers have had in a condensed form a number of articles descriptive of the results achieved by the geological survey of the Territories to which subject we have paid special attention. The series of articles on "Hydraulic Mining in California," from the pen of Mr. Bowie, a scientific as well as a practical hydraulic miner, renders this volume particularly valuable. It may be said here that the articles really comprise a treatise on the subject, the best yet written. They have been profusely illustrated and give every possible detail in connection with this important industry from the inception of an enterprise to the productive results. The tables showing the results of practical work are especially valuable and the whole treatise will serve as a guide either to the investor or the practical miner. Mr. Bowie deserves the thanks of the mining community for compiling so skillfully and intelligently so many scattered facts and freely giving the results of his own wide experience through the columns of the PRESS.

Space will not admit of our giving any further resume of the contents of the volume, but the index will speak for us. We have aimed in our editorial columns and in the whole paper to give as much information on as great a variety of subjects as possible. When abuses in mine management have been apparent we have not hesitated to denounce the perpetrators, and where controversies have occurred we have consistently upheld the cause of the working miner and the mechanic. The MINING AND SCIENTIFIC PRESS is devoted to the interests of the industrial class, and being under the guidance of no clique or ring has been free to express itself as it chose.

We have naturally endeavored to make the paper as interesting and valuable as possible to our readers, for it is for our mutual interests to do so. The paper has, now survived its eighteenth year of usefulness, and in its prime. Many of our subscribers have been with us from the first, but we have gained new friends from year to year. The circle can still be widened, however, and with it our field of usefulness. Those who know the merits of the PRESS can bring it to the attention of new comers and aid us in a practical way. The end of the volume is a fitting time for old subscribers to renew and for new ones to send in their names and their money. Nothing in this or any other country can be run successfully without ample funds, and we aim to improve as the country improves. In fact we are ambitious to keep a little ahead, and we hope our readers have enough pride in the only technical journal on the coast to give it every assistance in their power. Our advertisers are the best among the business men of the community, and our readers are mainly hard-handed but intelligent miners and mechanics. Their continued assistance we deem a just due for the labor bestowed to uphold their interests and furnish information of value to them. New ones are always welcome, the more the merrier, and the sooner the better. Every miner and mechanic of progressive tendencies on this coast ought to take the PRESS, and the quicker they who are not now subscribers, become so, the more advantage it will be them.

## A Prosperous Mine.

It is not often that one has an opportunity of chronicling the fact of a mine having paid 100 consecutive dividends. In fact, we do not remember having ever done so until now, in making an abstract from the report of the Idaho mine, at Grass Valley, Nevada county, California. The mine this month declared its one hundredth dividend, aggregating 734 1/2% of the original stock of the company, or in all \$2,270,750.

This mine is one that has been, and is, legitimately worked for what is in it, and is not carried on as a stock speculation. It is not known at the Stock Exchanges, which is probably one reason why it has been so uniformly prosperous. The annual meeting of the company was held in Grass Valley on the 17th inst., and the local papers publish the reports of the officers in full, from which we make some extracts.

The Superintendent, Mr. Edward Coleman, says that the past year has been one of average prosperity, and although they have not met with any very high grade ore they have still had a constant supply that has given a fair return and enabled the company to pay a \$5 or \$7.50 dividend every month. The ore in sight

is good and the mine in good condition, so the Superintendent sees no reason to expect any material falling off in yield or dividends. The drifts are well ahead of the stopes, and several years' work may be expected from the ore in sight and what may reasonably be expected from below the 1000-foot level. The main shaft is down to the 1000-foot level and the pump shaft to the 800-foot level. The Superintendent says:

In view of the rapid pitch of the pay chute from the main shaft, and the large amount of dead work that will have to be done in order to open another level from the shaft, it is deemed advisable for the working of the mine below the 1000-foot level to sink an incline from this level and follow to pay chute down; and for this object we are now opening up a station to fix the engine, and have already ordered a compressor to supply the air as the motive power.

The total depth of the present workings in the mine is 991 feet perpendicular. This gives an incline following the ledge of 1,076 feet; and as our main shaft is on an incline this should be considered the full depth of our 1000-foot level—and below this point nothing has been done.

During the year we have crushed 29,250 1/2 tons of ore; of this amount 1,254 1/2 tons came from the 500-foot level; 1,518 1/2 tons from the 600-foot level; 5,537 1/2 tons from the 700-foot level; 9,289 1/2 tons from the 800-foot level; 10, 149 tons from the 900-foot level, and 1,502 1/2 tons from the 1000-foot level. This gives a yield of

28,925 1/2 oza. bullion, value.....	\$508,138.20
Sold 108 tons of sulphurates.....	6,498.10
Paid \$20 per ton for working.....	2,102.00
Specimens.....	1,950.04
Total yield of tailings.....	11,390.45

Total yield from ore.....\$530,143.69  
Giving an average of \$18.12 1/2 per ton.

I again have to report that all business connected with the company affairs in a satisfactory condition, and, except the compressor now ordered, I know of nothing that is likely to occur requiring any outlay of money more than the usual expenditures required for milling, mining and keeping the works in proper repair.

The total expenditures of the mine for the year are shown in the following table:

Mill and mining.....	\$257,658.00
Saving sulphurates.....	2,921.00
Grinding tailings on percentage.....	1,798.25
Compiling main and pump shaft.....	10,072.35
Repairing shaft.....	4,332.83
General account.....	9,265.00

Total expenditures.....\$284,140.99  
The cost of milling and mining per ton was \$8.91.

The Secretary, Mr. Geo. W. Hill, reports that at the commencement of the fiscal year there was a balance in the treasury of \$20,165.31. The receipts from all sources for the year were \$525,435, to which add the balance on hand December 4th, 1876, of \$20,166.31, making the amount for the year \$545,601.40.

The total expenses, including 12 dividends, for the year were \$524,396, leaving a balance in the treasury of \$21,205.40.

To the foregoing monthly expenditures are included 12 dividends declared for the year herein stated and at the time and amounts as follows:

No. div.	Declared.	Per cent.	Amt.
89	Jan. 1, 1877,	7 1/2	\$23,250
90	Feb. 5, "	7 1/2	23,250
91	March 5, "	7 1/2	23,250
92	April 2, "	7 1/2	23,250
93	May 7, "	7 1/2	23,250
94	June 4, "	7 1/2	23,250
95	July 2, "	7 1/2	23,250
96	Aug. 6, "	5	15,500
97	Sept. 3, "	5	15,500
98	Oct. 1, "	5	15,500
99	Nov. 5, "	5	15,500
100	Dec. 3, "	5	15,500

Being for the year 77 1/2% upon the capital stock and amounts to.....\$240,250

The following tables show the aggregate receipts and expenditures of the company for the past nine years, that being the period in which the mine has paid dividends, and before which only prospecting was done. Receipts from all sources for the fiscal years:

1869.....	\$306,038.75
1870.....	183,450.23
1871.....	407,301.16
1872.....	404,035.52
1873.....	1,010,612.20
1874.....	669,023.03
1875.....	509,430.72
1876.....	573,028.31
1877.....	525,435.00

Total receipts for nine years.....\$4,589,255.01

There has been paid out in dividends to the stockholders as follows:

1869 11 divs. aggr. 55 per cent.....	\$170,500
1870 7 " " 12 " ".....	37,200
1871 12 " " 12 " ".....	232,500
1872 11 " " 52 " ".....	109,750
1873 12 " " 220 " ".....	682,000
1874 12 " " 102 1/2 " ".....	317,750
1875 11 " " 55 1/2 " ".....	172,050
1876 12 " " 82 1/2 " ".....	255,750
1877 12 " " 77 1/2 " ".....	240,250

Total.....\$2,270,750

This makes 732 1/2% of the capital stock paid in dividends, a showing that very few mining companies can make, here or elsewhere.

THE rainfall in San Diego up to the 24th inst. amounted to 4.50 inches for the season. Rain fell on Christmas day. The rivers are rising all over the southern section of the State and in Lower California.

TWO HUNDRED men completed the repairs of the Southern Pacific road, between Dos Palmas and Volcano, on the 20th.

### The Necessity for Home Manufactories.

The only way that California can be made to be the prosperous State that she was before the railroads brought her into direct competition with the East, is to have work for everybody as there was then. And the only way to give everybody work is for our capitalists to stop speculating and lending money and start up home manufactures. The trouble with us now is that we have more people than we have work for. We have not enough manufactories. We buy too many things abroad that we could make as well or better at home, and still we wonder why "hard times" visit us and stay so long.

Another thing is we want too much for our money. People who have it expect it to earn its own per cent. at least, simply by loaning it. Those who would establish manufactories if they could find it possible to do so and pay the rates of interest charged. Again, some of them say, "We must put up \$20 in silver as security for \$20 in gold." No matter how much land a man has or how good it is he finds it next to impossible to borrow any money on it if it is in the country. And if he does succeed in raising anything on it they will not lend more than a quarter of its value.

There has got to be a radical change in our manner of doing business on this coast, or things will go from bad to worse. No man can make a manufacturing business pay when he has to hire money to carry it on at a cent or cent and a half a month. And not only that, he

precarious existence in any way, so they evade real work, must take off their coats, turn up their sleeves and handle the hoe or the plow, the hammer or the plane, or they must leave this country for some other—if they can find one—where there is more room for them than here. Work, real earnest, hard work is what the Pacific coast community must come to if they would be prosperous. The cities are filled with idlers who should be tilling the fields or working the mines, and rich men who are money lenders instead of producers. People can ill afford to borrow money as rates now stand, and these men must establish manufactories to invest their money or keep it unproductive in their hands.

The times are ripe for change, and change there must be. With more manufactories there will be more opportunity for labor. As each man's arm becomes productive prosperity will rule among us once more, and California resume the proud position to which she is so well adapted. Her geographical position, climate and other natural advantages are in her favor, but her people must do their share in the good work to make her the most prosperous State in the Union.

### Patents for Mining Claims.

Following is a complete list of patents issued for Pacific Coast mining claims since last report:

California—Nevada county, South Yuba Canal Co., for Chicken Point and Smith, Powell and King placer mines; Bernhard Hysink, Emigrant placer mine; Henry P. Connor, North

### An Improved Boiler Feeder.

The Hancock Inspirator, illustrated on this page, is an apparatus for feeding water to steam boilers, for filling tanks and for any purposes for which a pump may be used in hauling water. It has no movable parts at all, but is a double apparatus, one-half of which is a lifter and the other half a forcer, the lifter drawing the water from any ordinary depth and delivering it to the forcer which delivers it to the boiler at any steam pressure without adjustment. An ordinary injector in a single apparatus, cannot lift water over five or ten feet and requires adjustment for varying steam pressures. The machine lifts as high as any pump and delivers it to the boiler, with very little steam pressure. It has lately been introduced on this coast by Parke & Lacy, 417 Market street.

The inspirator differs materially, both in its construction and working qualities, from the class of boiler feeders known as injectors, inasmuch as it has one set of tubes for lifting and another set of tubes for forcing water, a combination entirely new, reliable and efficient. There being no movable parts in its internal construction it requires no oiling or adjusting to various pressures or lifts, which is necessary with other pumps.

Fig. 1 is a section showing the construction of the inspirator, and Fig. 2 is a perspective view of a stationary one. Fig. 3 shows the locomotive inspirator made on the same general

### Mine Investigation.

A committee composed of Augustus Waterman, James Biddulph and W. L. B. Mills was appointed at a meeting of the Advance silver mining company, on the 15th of last month, to examine the company's books and accounts. Majority and minority reports have been prepared, the former signed by Mills and Biddulph and the latter by Waterman, who was chairman. The majority report sets forth that the statement made in Mr. Waterman's report, in regard to the receipts by the company for stock sold, is entirely at variance with the facts as apparent in the books and accounts of the company.

Waterman, in this minority report, says he has been able to obtain the following summarized information from the books of the company: "8,636 shares, as per books of the company, sold for \$26,108; 6,465 sold, as per books on file in court, for \$27,000, and 4,014 for \$37,000, being a total of 19,135 shares known to have been sold for \$90,108, thus leaving unaccounted for 12,666 shares, which, at \$2.50 per share, the lowest price the stock sold at, would be \$31,665, or a grand total of 31,801 shares for \$121,773. This gives an average price of only \$4 per share, which is, in my opinion, below the real average. If the stock sold was, as represented, working capital, the company should have been credited with \$121,773, instead of \$58,447.50. If, on the contrary, it was not working capital, the stockholders have been de-

FIG. 1. SECTION OF HANCOCK INSPIRATOR.

FIG. 2. THE HANCOCK INSPIRATOR.

FIG. 3. INSPIRATOR FOR LOCOMOTIVE BOILER.

finds it difficult to get money at any price to establish anything new, such is the disinclination of our moneyed men to enter the manufacturing field.

"Cent per cent" has been our bane and still continues. As soon as a man gets a little money he knocks off work, sits him down, and expects his money to do the work for him, and he stops his work so soon that he wants a small amount to yield a large one, and charges his rate of interest accordingly. It is all very well to say you can get money in San Francisco for seven or eight per cent., but let any one try it at the banks and offer anything as security less than a first-class piece of city property and see how he succeeds. And then let him try to borrow from a private individual and see what success he meets in that direction.

There is not the slightest doubt but that this habit of collecting high interest has done more harm in California and kept it back more in every sense, than any railroad monopoly, Chinese immigration, land-grabbing schemes, Mexican grants, or any other grievance of which we have complained. When one-quarter of the people want to live on interest paid by the other three-quarters, and that one-quarter spend more than the others earn, the result is not satisfactory and the state of affairs cannot last long.

We must all go to work. There is no use in putting off the issue any longer. The non-producers in our midst are too many and with them no country can be prosperous. The thousands who want to make their living from stock speculations must quit this precarious trade and work in the mines. Those who stand between the producers and consumers must perforce become producers as they are already consumers. The men who hold large tracts of land at prices no real farmer or border could afford to pay, must sell these lands to men who will cultivate them and must assist them in so doing. The thousands of idlers in our cities, who eke out a

Bonner quartz mine; Robert McMurray, placer mine; Yuba Gravel Range Co., placer mine. El Dorado county—Matthias Seeley and others, Grizzly Gulch placer mine; Adolph Wenzee, Bean Hill placer mine; Geo. W. Swan, Eastern Buckeye; Carrie Halle Hydraulic, Mining and Water Co., Trinity and Succor and Christian placer mines. Butte county—J. B. Haggin, '49 and '56 quartz mine.

Nevada—Eureka county, Adams Hill Mining Co., mineral, Lee, Line, Joseph Ringot, Hulucott mines; Silver West Co., mill-site. Lander county, Henry L. Byrne, DeFrance; Eagle Silver Mine and Mill Co., Monitor and Eagle mines. White Pine county, P. L. Weaver, King lode; Newark Co., Buckeye, State and Lincoln mines.

Utah—R. B. Chisholm, assignee of Elgin Chieftain Mining Co., Chieftain lode; Jersey Co., Jersey mine; R. C. Chambers, City Rock mine; Isaac S. Waterman and others, Severe and J. W. Cootey mines.

Pacific Coast miners will remember that Dewey & Co., this office, are now fully prepared to procure patents for mines, expeditiously and cheaply, and will furnish information on the subject to those desiring it.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from the prominent mines have been as follows: Con. Virginia, Dec. 19th, \$152,495.58; California, 19th, \$235,655.49; Northern Belle, 17th, \$3,139.55; Grand Prize, 21st, \$11,700; Alps, 19th, \$1,627; Gila, 16th, \$95.67; Alps, 21st, \$9; Con. Virginia, 22d, \$173,692.34; California, 22d, \$116,569.77; Northern Belle, 19th, \$2,971.22; Northern Belle, 22d, \$4,260.83; Arizona, 20th, \$1,050.51; Standard, 21st, \$33,558.27; Tybo Con., 17th, \$4,384.14; Alps, 22d, \$2,631; Alps, 24th, \$2,074; Grand Prize, 24th, \$12,900; Tybo Con., 21st, \$4,235.22; Martin White, 25th, \$20,900; Alps, 26th, \$2,109; Gold Hill (Idaho), 26th, \$17,600.

principle but varying slightly in detail, being operated by a single lever. It is claimed that this device will start at a lower pressure than any pump, thereby obviating the necessity of moving a mass of machinery for running a power pump, or raising sufficient pressure for running a steam pump if necessary to fill the boiler when the machinery is not in operation, thus making a saving in fuel and wear and tear of pumps, etc., as only a small head of steam need be kept up. The conditions for its certainty of working are: First, an air-tight suction; second, an abundant supply of water with a lift not exceeding 25 feet, and a temperature not exceeding 120° Fah. for a low lift and 100° for a 25-foot lift. No adjustment is necessary for varying steam pressures. It can be started at a low lift at five pounds pressure and will continue to work without any adjustment up to any pressure allowed by law. The advantage of this peculiarity of the Hancock will be evident to engineers. The inspirator is intended for stationary boilers, locomotive boilers, for use at watering stations on railroads, for mining purposes, as a hinge pump, for emptying or filling tanks in buildings, as well as for general pumping purposes. Further details are given in the circulars, which will be sent on application to the above address. These machines are meeting with great favor in the Eastern States, but have only now been introduced here.

The Treasury now holds \$346,277,540 to secure National Bank circulation, and \$13,985,000 to secure public deposits. United States bonds deposited to secure bank circulation for the week ending last Saturday amounted to \$802,000; amount withdrawn, \$118,000; National Bank circulation outstanding—currency notes, \$320,233,765; gold notes, \$1,432,120.

The English government is taking an account of its stock of war material.

ceived when it was represented to them that it was, and that the proceeds would be used in developing the mine.

A meeting of the dissatisfied stockholders of the Modoc mining company has been held. A report of the committee appointed at a previous meeting to inquire into the affairs of the company was read by the Secretary, Captain Mullett. The President, J. W. Coleman, had given them permission to examine the books and the employment of experts for that purpose was recommended. Several stockholders urged a speedy and thorough examination of the affairs of the mine. It was suggested that while they were about it they might find out whether the dividend paid last January, under Pearson's management, came from profits or assessments. Much dissatisfaction was expressed with the present management. It was finally voted to employ experts to examine the books, the expense to be defrayed by the dissatisfied stockholders at the rate of one dollar for each person holding less than 100 shares, and one cent per share for all having more than that number. Ten thousand shares, or one-tenth of the total number, were represented at the meeting.

The Justice investigating committee have not concluded their labors, but the Virginia Chronicle asserts that the mine has paid \$161,064 above expenses in the last two years, notwithstanding which assessments have been levied aggregating \$2,152,000. If to the amount of assessments the bullion yield be added, the total amount of money to be accounted for cannot fall much below \$5,000,000. A pretty state of affairs!

BUSINESS was generally suspended throughout the coast on Christmas day, and the day was appropriately celebrated, religiously and socially.

The internal revenue collections in this district last week amounted to \$24,064, and the total since January is \$2,002,878.

## EDUCATIONAL.

THE BERKELEY GYMNASIUM.

A PREPARATORY

SCHOOL TO THE UNIVERSITY.

THE FIRST TERM WILL COMMENCE

Wednesday, August 1, 1877, and close Thursday, December 20, 1877.

THE SECOND TERM WILL COMMENCE

Wednesday, January 9, 1878, and close Thursday, May 30, 1878.

The location of this Institution for health, has no superior. Its proximity and relationship to the State University give it many advantages that no other school on the Pacific Coast can command. Our first aim is to secure to every student in our charge such accommodations as will make him

**Comfortable and Contented.**  
Devoted to but one well defined work, we are gathering around us the youth of loftier minds and purer aspirations, such as are seeking a higher education. We are protected, naturally, from that class of students who are sent to school to escape the House of Correction. The Principal and Faculty respectfully solicit a fair investigation from intelligent parents and earnest students.

## REGISTER YOUR TRADE MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks. We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

## ARITHMETIC MADE EASY BY ROPP'S EASY CALCULATOR.

This valuable work is used by thousands of farmers, mechanics and business men, and is highly recommended for its practical utility and convenience. It embodies an entirely new system of calculation, by which a vast amount of figures and mental labor—required by the ordinary methods—and fractions with their complexities, are absolutely avoided.

It is so simple and easily comprehended that even the most illiterate is enabled, in a few minutes, to reckon with absolute accuracy and speed; while the original and rapid methods, benefit and delight the most scholarly.

It shows at a glance the accurate value of wheat, corn, rye, oats, barley, cattle, hogs, hay, coal, lumber and merchandise, from a pound to a car load, and for any price the market is likely to reach.

It gives the interest, simple and compound, on any sum, for any time, at six, seven, eight, and ten per cent.; the exact measurement of boards, scantlings, timbers, saw logs, disterns, tanks, wells, granaries, bins, wagon beds, corn cribs, etc.; the wages at various rates, for hours, days, weeks and months; besides numerous other important methods, rules and tables.

It is printed on fine tinted paper, is well and elegantly bound in pocket-book shape, and accompanied by a silicate slate, pocket for papers, and memorandum, which can be replenished in the two latter styles.

It answers the purpose of a pocket book and diary, and costs no more, although it was gotten up at great expense and labor, and is unquestionably one of the most useful publications ever issued from the press.

Price, bound in Fine English Cloth, \$1.00. Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter or receipted by express. Address

**DEWEY & CO., San Francisco.**

Newspaper Fileholders.

Dewey's new elastic fileholders (black walnut), size of the Press, Harper's Weekly and Scientific American, for 50 cents. Larger size to suit any newspaper, 75 cents. By mail, postpaid, 10 cents extra. Cash with all orders. Patent allowed. Address, Dewey & Co., Publishers, San Francisco.

## TAXES.

1877-1878.

Notice is hereby given, that a certified copy of the Assessment Book of the Taxable Property of the City and County of San Francisco, Real Estate and Personal Property (Subsequent Assessment Book included), for the Fiscal Year 1877-78, has this day been received; that the State, City and County TAXES for said fiscal year are now due and payable at the office of the undersigned, Room No. 1, City Hall, and the Laws in regard to their collection will be strictly enforced.

Taxes will become delinquent on the FIRST MONDAY in January, 1878, and unless paid prior thereto, Five per cent. will be added to the amount thereof.

WM. FORD,

Tax Collector of the City and County of San Francisco.

SAN FRANCISCO, October 22, 1877.

## Montgomery Avenue Tax.

Notice is hereby given that a certified copy of the Assessment Book of Real Estate, which is subject to Assessment to defray expenses incurred by the opening of Montgomery Avenue, has this day been placed in my hands to collect Taxes thereon.

Said Taxes are for the Fiscal Year 1877-78, and are now due and payable at the office of the undersigned, Room No. 1, City Hall. All Taxes remaining unpaid on the FIRST MONDAY of January, 1878, will have Five per cent. added thereto.

WM. FORD,

Tax Collector for the City and County of San Francisco.

SAN FRANCISCO, October 22, 1877.

## ASSESSMENT OF LANDS

Benefited by Widening Dupont St.

Notice is hereby given, that a certified copy of the Assessment Book of the Real Estate which is subject for the payment of Principal and Interest upon "Dupont-Street Bonds," as directed by an Act of the Legislature of California to authorize the Widening of Dupont Street in the City of San Francisco, "Approved March 23, A. D. 1876," has this day been placed in my hands for collection. The Laws in regard to the collection of the same will be strictly enforced.

WM. FORD,

Tax Collector of the City and County of San Francisco.

## Musical Instruments.

The firm of Kohler & Chase, of 633 and 635 Clay street in this city, is an old established and trustworthy house, dealing in pianos, organs and all other kinds of musical instruments. They are extensive importers of instruments and instruction books, and have long held an enviable position in this branch of trade. We take pleasure in recommending them to all our readers who wish to introduce the refining influences of music to their homes. The firm make a specialty of the Decker Brothers' piano, the Mason & Hamlin cabinet organ, the Emerson piano and the J. & C. Fischer upright piano. All of these instruments have gained a wide fame for excellence and won high praise from those who know best what constitutes excellence in a musical instrument.

We would speak especially at this time of the Decker Brothers' piano. We cannot do better than present a testimonial of its quality, freely given by a group of musicians whose praise will commend itself to all music lovers. During the Centennial there was held in Philadelphia a grand musical congress, at which the Decker Brothers' instruments were used, and the result was the following straightforward endorsement:

PHILADELPHIA, June 27th, 1876.  
The Decker Brothers' Grand pianos, used by the Musical Congress at their grand operatic concerts and musical festivals, recently given at the American Academy of Music, were remarkable for their superior quality of tone and extraordinary power. Finer instruments we never heard. Clara Louise Kellogg, Annie Louise Cary, Zella Seguin, Julia B. Rive, Esmeralda Corvautes, Joseph White, Max Marotzek, P. Brignoli, S. B. Mills, P. Ferraui, Franz Remmert, E. Behrens.

A matter which we would make most prominent in this connection is, that the Decker Brothers' name is the subject of attempts at counterfeiting. This is the penalty which the manufacturers of a first-class instrument have to pay for the gaining of a good name, and all our readers should be on their guard against imposition. Unprincipled parties have manufactured and sold cheap pianos under the names of "Decker," "Decker & Co.," "Decker & Brothers," "Decker Brothers," etc., doing business on the reputation and popularity of the celebrated Decker Brothers' pianos. All genuine Decker Brothers' pianos have their name in front on the pianos above the keys, viz.: Decker Brothers, New York. In all genuine Decker Brothers' square pianos the following words appear, cast upon the iron plate on the inner left-hand side of the instruments: Decker Brothers' patent, June 21, 1863.

The simplest way to guard against imposition is to deal with those who are well known to be trustworthy. Kohler & Chase have a reputation of this character established by twenty years of business experience in this city.—*Pacific Rural Press*, Nov. 1st, 1877.

## The Best and Most Popular Pianos

—ARE THE—

## DECKER BROS'.,

The EMERSON and

The FISCHER Upright

## A GREAT OFFER.

WE WILL SELL THE MAGNIFICENT

## Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the HAMPDEN WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

DEWEY & JORDAN, Agents, 433 Montgomery St., S. F.

## Smelter and Refiner.

A competent person is desirous of receiving the position of Superintendent of a Smelting and Refining Works. Can give satisfactory reference for ability to smelt all lead ores, refine silver and make market lead. No objections to go to the Territories. Address P. F. M., this office.

25 ELEGANT CARDS, no two alike, with name, 10 cents, post. paid. J. B. HUSTED, Nassau, N.Y.

Among the advantages gained by this holder are the following:

It can be opened and closed quickly. The points are less obstructed while the articles to be filed are being placed.

The papers (wholly or partly folded) can be either "straddled" over the lower bar, or filed in regular book order.

The elastic hinge and band accommodate and hold firm either a large or small number of papers.

With less material, it is lighter and less cumbersome than other holders, and approaches nearer to bookbinding. It has no rigid hooks, hinges or loose parts to break or get lost.

It has proved durable in practice. The file is adjusted but 52 times a year for a weekly paper, and a sample holder can be opened and closed 1,000 times without showing wear.

Five sizes are made to suit the dimensions of different papers, viz.: 18, 22, 26, 30 and 34 inches, inside measure. Single samples will be mailed from this office for 50 cents, postpaid. Wholesale and retail agents wanted.

## A JOB PRESS WANTED.

Any printer having an Eighth or Quarter Million Job Press for sale, will please address J. P., care of Dewey & Co., S. F. State condition and lowest price.

## Mining Suits and Decisions.

A complaint has been filed in the Fourth District Court against the Alta mining company, to have a deed recently made by the Justice mining company set aside, on the ground that it was obtained by bribery and fraud. The complaint alleges that the Schultz-Justice party conspired with certain parties to obtain a portion of the Justice mining grounds, and in order to do this gave to the Alta mining company a deed to a portion of the ground, for the ostensible purpose of avoiding litigation about the portion of ground to which the Alta company set up a claim. The complaint further sets forth that while the Schultz party claimed to have made the deed without monetary consideration, the deed was given in consideration of \$200,000. The complaint concludes with a prayer that the Alta mining company be required to reconvey the property to the Justice mining company.

In the case of Kitz et al. vs. the Lady Bryan mining company, Judge Wheeler has decided in favor of the company and ordered the dissolution of the injunction granted a year ago restraining defendant from selling delinquent assessment stock. He explained that the plaintiffs claimed that as the Trustees had not fully collected assessment No. 13 it had no right or authority to levy another assessment. It had, however, been shown in evidence that there was an injunction on assessment No. 13 when the last one was resolved upon, and that the law gave the Trustees power to do this. While the management of the mine was not such as to excite the moral admiration of the court, it could not interfere with the actions of the Board so long as no law had been violated. The Board had full discretionary power, and if persons bought stock in the mine they were, of course, bound to abide by the decision of the Trustees.

In the Exchequer pool case Judge Morrison has decided that C. E. Brooks need not answer questions as to the amount of capital he brought with him to this city, which were put to him by the referee in the suit of Henry S. Tibbey vs. John Leighton, the manipulator of the Exchequer pool. He thought that the inquiry was too broad, and involved many matters which could not be investigated in this proceeding. Brooks could only be questioned respecting property in his hands, or credits belonging to the defendant in the attachment suit. When he denied having any property in his possession, or under his control, belonging to the defendant, but claimed such property in his own right, he was entitled to have the matter tried by a jury, and could not in this summary manner be compelled to deliver such property into the hands of the Sheriff.

## News in Brief.

THE city hall at Portsmouth, N. H., was burned on the 20th.

STANLEY is on his way home from Africa. The siege of Erzeroum is to be commenced shortly.

THE Vallejo bank, which suspended last year, is to resume business on January first. The total Russian loss by the war to December 20th, is \$8,412 men.

THE Porte has issued a proclamation deposing Prince Milan of Serbia.

ARIZONA is having a good deal of trouble with highway robbers.

THE Cretan insurgents are forming a National Assembly.

J. B. PIER, owner of a large fleet of bay schooners, died in this city this week.

HENRY PINCHBECK, the architect and builder of Manchester, has failed. Liabilities \$540,000.

IT is said that the Porte will shortly order a fresh army of 300,000 men.

THERE were 105 deaths in the city last week, or 23 less than the previous week.

THE famous trotting mare, "Flora Temple," is dead.

THE jury on the Low will case disagreed and it will have to be tried all over again.

TULARE LAKE is now down 13 feet below high water mark, and Root island is a part of the main land.

ADOLF BIRGHAM, of the firm of Fenisier & Birgham, commission merchants in this city, has committed suicide.

IN consequence of a proposed reduction of wages after the holidays, 1,000 ironworkers at Sheffield have struck.

IT is proposed to mold a fountain and statue of George Washington at the junction of Washington square and Powell street in this city.

A BILL is pending in Sacramento, which proposes to regulate the prices and quality of gas in this city.

THE California & Nevada Meat Shipping Co. have commenced shipping meat to this city in refrigerator cars.

THERE is a movement on foot in Chicago to establish a mining stock exchange to deal in California shares.

THE Union Pacific rolling mills at Laramie are a work on 8,000 tons of iron rail for the Utah Northern.

GOLD excitement continues regarding discoveries in Cariboo, and business is very brisk at Victoria.

THE amount of deposits in the saving banks of the United States is estimated at \$1,500,000,000.

ALL our interior exchanges represent the farmers to be in good spirits over the recent rains.

THE town house and Winthrop church at Holbrook, Mass., were burned on the 25th.

GENERAL ESCOBEDO says there is no ground for trouble between this country and Mexico.

DURAND, President of the French Council, has ordered proceedings begun in regard to electoral offences, that offenders cannot plead delay in instituting prosecutions.

MILLEN McCULLOUGH, a young man well known in Yuba City, mortally wounded Charles Finn in a fight on Christmas eve in that place.

A FIRE at Stayton, Marion county, Oregon, destroyed \$7,000 of property on the 21st. Hobson & Whitney were the losers, but have covered \$5,000 with insurance.

IN an address before the Paris Academy of Sciences, De Lesseps stated that the probable cost of a Darien ship canal, on the line advocated by him, at 600,000,000 francs.

THE hands in the Pennsylvania railroad shops at Altoona are just finishing an order for 63 engines cabs, to make good the number destroyed at Pittsburg during the riots.

BY an explosion and resultant fire of a candy factory in New York on Friday last, some 40 lives were lost, principally boys and girls. The company's loss was \$450,000.

GENERAL SHERIDAN has been notified of the Secretary of War's approval of the final survey of the military road from Bismarck to the Black hills.

MR. J. C. FLOOD, of the bonanza firm, distributed \$7,000 on Christmas among the orphan asylums and benevolent societies.

THE two bonanza mines, California and Consolidated Virginia, have paid 40 \$1,080,000 dividends in the past two years. The total is \$43,200,000.

THE Sutter street railroad company reduce the fare on all their lines on the first of January to five cents. The other lines will have to follow suit.

EXCISE COMMISSIONER OWEN MURPHY, of New York, has absconded with about \$30,000 to \$40,000. He is supposed to have sailed for Europe.

THE party of raiders who recently went through the town of Caliente, were put in jail after being caught. The citizens took the five men from the jail and lynched them.

IT is said a London manufacturer of military stores, who had large orders on hand for Russia and Turkey, have received notices of cancelling them.

NO special preparation is going on at the Woolwich (England) arsenal, except the manufacture of field guns. Only 4,000 hands are employed. The war force is from 10,000 to 12,000.

GREAT distress prevails among the poor of Constantinople. The prices of provisions are rising in consequence of the depreciation of the currency, and difficulties are feared if the price of bread rises higher.

THE bill recently passed by the Legislature to submit to the people of this State at the next election the question whether they favor the presence of the Chinese among us, has been signed by the Governor and become a law.

A Herald London special says: The matter of rapid transit in New York is settled. An English syndicate is to build the road, which is to be underground. Work will begin immediately. The road is expected to cost from \$6,000,000 to \$8,000,000.

AS the question of subsidizing mail steamship service will be one of the subjects to be considered by Congress at the present session, an effort will be made to have inserted in any bill which may be passed granting a subsidy, a claim compelling the company to have its vessels manned by American seamen.

THE Ohio Agricultural College will begin in January a course of special lectures to practical farmers—a large number of whom have asked for such lectures. A tuition fee of \$5 will be charged, simply to cover the actual expense of the lectures.

THE Alsace and Lorraine Provincial Committee has passed a resolution expressing a wish that Alsace and Lorraine should receive its own Constitution as a Federal State, and to have a representative in the Federal Council of the German Empire.

THE work on streets projected by the old Board of Supervisors, and which was not commenced, has been abandoned, the contractors perceiving the necessity of either submitting to that plan or going without pay.

IT has been decided by the Directors of the Hibernia savings bank to postpone the erection of a new building on their lot on the corner of Post and Montgomery streets, and to remodel their present building and that adjoining on Montgomery street.

THE Massachusetts Savings Bank Commissioners have enjoined the Taunton savings bank from doing further business. The bank has \$1,404,515 assets, with \$1,353,763 liabilities. The weak condition of the bank is due to the depreciation of loans on mortgages.

AN official telegram states that a sudden drifting of the ice on the Danube has torn away the bridge at Ibrai. A Russian steamer is frozen in and is unable to approach the bridge. Grand Duke Alexis announces that communication cannot be restored for the present.

Le Temps, alluding to a report that active intercourse has been going on between Paris and London with a view of establishing an understanding on the Eastern question, says: It is perfectly certain that the French government does not intend departing from its attitude of reserve to play an active part in Eastern affairs.

## PATENTS AND INVENTIONS.

## List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington, D. C.

WEEK ENDING DECEMBER 27TH.  
BOOKS FOR CARRYING FISHING FLIES.—Henry H. Holt, Kalama, W. T.  
PISTON WATER METER.—Alvah C. Austin, Oakland, Cal.  
RAILWAY AIR BRAKES.—N. W. Green and G. W. Hoag, of San Jacinto, and T. C. Cleveland, of Mountain House, Cal.  
ORE ROASTING FURNACE.—E. G. Hall, Healdsburg, Cal.  
WINDMILL.—R. R. Lander, Turlock, Cal.  
LIGHT WEIGHT ROPE.—A. D. Ledy, S. F.  
HARVESTER.—Samuel Spencer, Turlock, Cal.  
WELL BORING MACHINE.—W. F. Vaughn and S. Jackson, Stockton, Cal.  
COMBINED RAILWAY AND CONDUIT.—J. B. Ward, S. F.  
GARDEN VALVE.—V. Kingwell, S. F.

TRADE-MARKS.  
OYSTERS.—Haas Bros., San Francisco and New York.  
PULVERIZED SUGAR.—Chas. J. Hawley, S. F.  
PACKED AND PRESERVED FISH AND MEATS.—J. O. Nanthorn, Astoria, Oregon.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.  
NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

WOODWARD'S GARDENS has the following new attractions. The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

## OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.  
B. W. CROWELL—California.  
A. C. KNOX—Pacific Coast.  
C. N. WEST—Santa Cruz, Monterey and San Benito counties.

A. C. CHAMPTION—Tulare, Fresno and Inyo counties.  
JOSEPH DUMICK—Mendocino, Humboldt and Del Norte counties, and Oregon.  
W. D. WURZ—San Bernardino and Los Angeles counties.

J. W. A. WRIGHT—Sacramento, Placer and San Joaquin counties.

B. E. LLOYD—Alameda, Contra Costa and Napa counties.

E. M. DENNY, Oregon.  
F. E. ALDERSON, Nevada.  
H. E. HALLER—San Joaquin, Yolo, Yuba, Sutter and Colusa counties.

## TO QUEBRISTS.

In propounding questions to the editorial, patent or business departments of this office, letter writers should be careful to enclose a stamp and addressed envelope if they wish prompt answer. If we were to furnish time, paper, envelopes and stamps, all free to parties who address this office on matters of more interest to themselves than to us, FIVE HUNDRED DOLLARS A YEAR would not cover the expense. This hint, however, is not intended for parties writing in our own or the public interest, or who would be obliged to delay writing at any time for want of an extra stamp.

## Hall's Journal of Health.

Contents of a Single Number:

The Little Courtesies of Life; Coughing in Consumption; Influence of Christianity on Medical Science; Ignorance and Ill Health; Rage and Ruin; Kindness the Best Punishment; Grass in Run; Valuable Table; Incurable Insanity; Consumption—A Suggestion; The Spirit Rapper Premium on Babies; Our Proverbs; Wrecked Clergymen; Marrying Well; The Lifting Cure; Sea Sickness; Face Painting; A Filthy Atmosphere; The Latest Crazy Man; A Suggestion; The Erie Railway; Sick Children.

Published in New York. E. H. GISS, M. D., Editor.

This journal has maintained the highest record of any health journal issued in the English language. It is not the amount of matter published which makes it the most valuable journal, but the plain and condensed truths it furnishes concerning that which is of ever vital importance to its large list of readers.

Annual subscription (post-paid).....\$1.60.  
To subscribers of this paper.....75 cents.

Address: DEWEY & CO.,

No. 202 Sansome Street, San Francisco,

Agents on the Pacific Coast.

## DEWEY & CO. American & Foreign Patent Agents

OFFICE, 202 SANSOME ST., N.E. COR. PINE, S. F.

**PATENTS** obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

### Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Denmark, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) sooner than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

### Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

### Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

### DEWEY & CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 202 Sansome St., N. E. corner Pine, S. F.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY &amp; CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,  
MINING ENGINEER AND METALLURGIST.

**Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick silver.** 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

**Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenicals, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.** 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

### Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope:

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working same, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patschen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroeck's process, etc. Under "Pulverizing Machines" are described the masta and its construction and operation, stamp batteries, screens, Crocker's trip-hammer hammer, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improved roaster, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., Mining and Scientific Press, 202 Sansome Street, San Francisco.

## UNITED STATES Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872; with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Surveys; Application for Patent; Proof of Posting Notice and Diagram of Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Register Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us and the subscribers against the acts and mistakes of others.

Any person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinued.

## Amusements.

**GRAND OPERA HOUSE.**  
Mission Street. . . . . Between Third and Fourth.  
M. A. KENNEDY, Acting Manager.

Open every evening. The Christmas attraction, **ROUND THE CLOCK.** Box office open from 9 A. M. to 10 P. M. Doors open at half past seven. Commence at eight.

### CALIFORNIA THEATER.

JOHN McCLINTOCK, . . . . . Proprietor and Manager.  
BARTON HILL, . . . . . Acting Manager.

Bush Street, above Kearny. Open every evening. **THE BLACK CROOK** and the **Kiraly Ballet.** Box office open from 9 A. M. to 10 P. M. Seats may be secured six days in advance.

### BUSH STREET THEATER.

CHAR. E. LOCKE, . . . . . Lessee and Manager  
FRANK LAWLER, . . . . . Acting Manager

Open every evening and Saturday matinee.

Fanny Buckingham

### MAZEPPA.

Seats may be secured six days in advance.

### BALDWIN'S THEATER.

THOMAS MACQUEEN, . . . . . Manager.

Corner Market and Powell Streets. Open every evening and Saturday matinee. Union Square theater company. Magnificent scenery; elegant appointments. Box office open daily.

## To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

### PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where he principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY & CO., Publishers.

## PACIFIC MAIL STEAMSHIP CO.

The Company's Steamers will sail as follows, at 12 M.:  
**ALASKA**, . . . . . JANUARY 1.  
For YOKOHAMA and HONGKONG.

**GEORGIA**, . . . . . DECEMBER 31.  
For PANAMA and New York, calling at Acapulco, San Jose de Guatemala, La Libertad and Punta Arenas. Tickets to and from Europe by any line for sale at the lowest rates.

## Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals, etc. We have a first-class

### Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

## Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers, S. F.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend this publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

**Advance Silver Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Monitor District, Alpine County.

Notice is hereby given that at a meeting of the Board of Directors, held on the twenty-first day of November, A. D. 1877, an assessment of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 16, No. 309 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the second day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the twenty-sixth day of January, 1878, at 2 P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office, Room 16, No. 309 California St., San Francisco, Cal.

**California Fruit Growing Association.**—Principal place of business, San Francisco. Location of property, El Dorado County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the seventeenth day of December, 1877, an assessment of two (\$2) dollars per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 16, No. 309 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the twenty-second day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the ninth day of February, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office, 331 Sansome Street, San Francisco, Cal.

**Manzanita Gold Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Sulphur Creek, Colusa County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the third day of December, 1877, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 51 Fremont Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the eighth day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Thursday, the thirty-first day of January, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

Office, 51 Fremont Street, San Francisco, Cal.

**New Basel Consolidated Gravel Mining Co.**—Principal place of business, San Francisco, Cal. Location of works, Placer County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the tenth day of November, 1877, an assessment of seven and one-half (7 1/2) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 610 Merchant Street.

Any stock upon which this assessment shall remain unpaid on the twenty-eighth day of December, 1877, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the fourth day of January, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office, 610 Merchant Street, San Francisco, Cal.

**South Overman Consolidated Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Gold Hill, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the twenty-sixth day of December, 1877, an assessment (No. 2) of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 323 Montgomery Street, Room 21, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-eighth day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the eighteenth day of February, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

Office, 323 Montgomery Street, Room 21, San Francisco, Cal.

**Summit Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the tenth day of December, 1877, an assessment (No. 1) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 418 California Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the twenty-first day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the twenty-sixth day of February, A. D. 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

Office, Room 2, No. 418 California Street, San Francisco, Cal.

**Timmy Chub Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Coronado Mining District, Los Angeles County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the fourth day of December, 1877, an assessment (No. 1) of fifty (50) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 25, Nevada Block, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the fourth day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-first day of January, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

Office, Room 25, Nevada Block, San Francisco, Cal.

**The Welch Consolidated Quicksilver Mining Co.**—Principal place of business, San Francisco, Cal. Location of works, Mount Diablo Mining District, Contra Costa County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the fifth day of December, 1877, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 7, No. 420 Montgomery Street.

Any stock upon which this assessment shall remain unpaid on the seventh day of January, 1878, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the twenty-sixth day of January, 1878, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

Office, Room 7, No. 420 Montgomery St., San Francisco, Cal.

## Attention, Mining Companies.

### RICKARD'S PATENT

Oxidizing and Chloridizing

### FURNACE,

FOR ROASTING

COPPER, SILVER &amp; OTHER ORES

Prior to Leaching or Amalgamation.

The most striking advantages which it offers above all other recent inventions of this nature may be briefly summed up as follows:

First.—Its cheapness, the cost of its erection (ex-royalty and freight) not exceeding \$1,500, for a capacity to roast and chloridize twenty tons per day, viz: brick work, \$1,000, and iron work, including blower, \$500.

Second.—Short time required for erection, viz: 14 days, after providing all materials, with a sufficiency of labor.

Third.—No expensive, heavy or complicated machinery being necessary, involving heavy freight to the district where it may be required. Brick and clay generally obtainable on the spot, being the chief materials required in its construction.

Fourth.—No skilled labor or technical experience is necessary to work it. Two ordinary laborers being sufficient to attend to it when in full operation.

Fifth.—It does not easily get out of order, and is readily repaired by an ordinary mason or blacksmith when it does.

Sixth.—The royalty, or license to use it, is exceedingly moderate, removing thereby all temptation to evade or infringe the patent.

Seventh.—Calculating labor at \$3 per day, and wood at \$6 per cord, the cost of roasting is but little over \$1.50 per ton (ex-salt when chloridized), at these high California rates for labor and fuel.

One of them is now in the course of erection by the Aztec Gold and Silver Mining Company, at their mill in the Aztec District, Santa Rita mountains, Southern Arizona. At their office, 302 Montgomery Street, rooms 14 and 15, a model may be seen, and working drawings, with all further information necessary to enable any ordinary mason to construct the furnace, may be obtained from

COL. J. D. GRAHAM.

Pamphlets, with illustrations and full description, sent on application.

## The Ingersoll Rock Drill

Mines Using these Drills on the Comstock

Loco-Virginia City, Nevada.

Con. Virginia M. Co., Best & Belcher M. Co., California M. Co., Crown Point M. Co., C & C Shaft, Belcher M. Co., Utah M. Co., Yellow Jacket M. Co., Ophir M. Co., Sierra Nevada M. Co., Mexican M. Co., Prospect M. Co., Overman M. Co., Baltimore Con. M. Co., Bullion M. Co., Silver Hill M. Co., Con. Imperial M. Co., Dayton M. Co., Gould & Curry M. Co., Sutro Tunnel Co.

J. B. REYNOLDS,

320 Sansome Street.

(Room 10.)

## THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con. solidated Co.'s mines, in Peavine District, Nev., and at the Eschequer mill, Alpine Co., Cal. For further information, apply to

D. J. O'HARRA,  
Reno, Nevada.

## San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.
